The R. E. Wood Lumber Company is completing a large band mill at Fontania, N. C., near where it has extensive timber holdings. The company closed out its operations in Carter county, Tennessee, south of Bristol.

Numerous buyers were on the local market this week, following the passing of the holiday season. The buyers report much difficulty in securing stock, due to the shortage that exists in this section and the fact that many of the mills are oversold.

The Bailey Lumber Company, which was recently organized at Bluefield, W. Va., will at once erect a woodworking plant in that city.

The Waynesville Lumber Company is making splendid progress with its new mill at Waynesville, N. C. O. H. Vial, formerly of this city, is general manager of the company and in personal charge of the work.

Among the buyers on the Bristol market this week were Charles C. Cross, a wholesale dealer of Philadelphia, and Mr. Allening, representing the Kile & Morgan Company of Providence, R. I.

The car situation in this section is unchanged. Considerable difficulty in securing cars is reported by some of the lumbermen, while others at shipping points where many cars are unloaded report that their wants are well taken care of by the railroads. Traffic is now the heaviest it has been in years, according to the railroad traffic agents.

The Guilford Lumber Manufacturing Company has purchased an additional tract of timber, located near Troy, N. C. The company's general offices are in Greensboro, N. C.

The band mill of the Peter-McCain Lumber Company, in this city, resumed operation this week after being idle for the past two weeks.

— < ST. LOUIS > —

Building operations in St. Louis for 1912 show a gain of \$2,068,848 over the previous year. The statement issued by the building commissioner shows that 8,593 permits were granted during the year for new buildings, repairs and alterations, the estimated cost of which aggregates \$20,676,403. In 1911, 8,982 permits were issued for buildings and alterations to cost \$18,607,555. The issue for the month of December aggregated \$1,608,373, a gain of \$972,955 over December, 1911, when the aggregate was \$635,408.

The Fidel-Ganahl Lumber Company is making repairs to its Broadway yard, which suffered from fire recently.

E. H. Luehrmann of the Chas. F. Luehrmann Hardwood Lumber Company says his company is having a satisfactory run of business. It is ready for the coming spring business, as its yard is pretty well stocked up with nearly all items on the hardwood list.

L. M. Borgess, secretary of the Steele & Hibbard Lumber Company, who is on the road nearly all the time covering the northern territory for the company, returned from a trip in time to spend the holidays with his family and also to act as one of the tellers at the Lumbermen's Exchange election. He reports a most satisfactory condition in his territory. Plain oak and ash are in good demand. Prices are steady on all items.

According to statistics given out by the Merchants' Exchange, receipts of lumber during the year 1912 were 179,466 cars by rail and 484,000 feet by river. During the year 1911 the receipts were 179,076 cars by rail and 1,382,000 feet by river. This shows a big falling off in receipts by river. Shipments during 1912 were 127,354 cars and 563,000 feet. During the year 1911 the shipments were 119,007 cars and 704,000 feet. For the first five months during 1912 there were no receipts by river. During 1911 the only month when no shipments were received was January.

E. W. Blumer, sales manager of the Lothman Cypress Company, believes this year will be a good one for cypress. He states that there are plenty of cars to be had now, and that shipments from the mills are coming in well.

One of the optimists as to hardwood conditions during the present year is W. W. Dings of the Garetson-Greaseon Lumber Company. He states that already there is a good demand for high-grade stock. This class of material is scarce and fancy prices can be obtained for it.

The result of the election of officers for the year 1913, held by the Lumbermen's Exchange, on Jan. 2, resulted in the election of the following: President, F. H. Smith; vice-president, W. W. Milne; directors, T. E. Powe, Franz Waldstein, R. F. Krebs, E. H. Luehrmann, H. A. Boeckeler, T. E. Youngblood and C. E. Thomas; board of arbitration, W. W. Dings, J. A. Reheis, C. D. Borrowman, Frank Liebke and L. E. Cornelius. The new board of directors will meet Friday, Jan. 10, to elect the treasurer and secretary for the year.

President Thos. E. Whitmarsh of the Lumbermen's Club has appointed the following committees for the year:

ENTERTAINMENT COMMITTEE—Julius Seidel, chairman; C. S. Chesbro, Max Mosher.

MEMBERSHIP COMMITTEE—C. M. Jennings, chairman; Thomas W. Fry.

STATISTICAL COMMITTEE—W. F. Biederman, chairman; Thos. J. Noser, Chas. L. A. Beckers.

TRAFFIC COMMITTEE—Thos. E. Powe, chairman; C. C. Schilling, C. L. Robinson.

ARBITRATION COMMITTEE—R. B. Beardon, chairman; C. H. Holekamp, W. W. Dings.

PUBLICITY COMMITTEE—W. E. Barns, chairman; Chas. E. Price, Dr. Hermann von Schrenk.

COMMITTEE ON PUBLIC AFFAIRS—Henry G. Rolfes, chairman; Chas. P. Conger, Henry O'Neil, C. A. Antrim, Frank Goepel.

— < MILWAUKEE > —

With a building record of \$15,400,000 for 1912, Milwaukee leads every city in the country in the gain of the amount represented by building permits. The \$3,110,000 gain over 1911 represents about twenty-seven per cent, which exceeds that of any other city.

The H. McIwen Box and Veneer Company has been incorporated at Shawano with a capital stock of \$25,000. The incorporators of the new concern are H. F. W. McIwen, E. W. McIwen and A. K. McIwen. Articles of incorporation have been filed with the secretary of state.

The Morton Salt Company is having a barrel factory erected at Superior to manufacture barrels for its own product. The factory will have a capacity of 1,200 barrels per day and will employ from twenty-five to fifty men.

The unusual rush of orders at this season has compelled the Webster Manufacturing Company, manufacturers of chairs at Superior, to declare the usual holiday recess off this year and make a material increase in its working force for the present.

The Stolle Lumber Company has succeeded the Stolle-Brandt Lumber Company of Tripoli, having taken over the mills and other property and continuing the business. The erection of a large veneer factory is contemplated.

The Mandt Wagon Company of Stoughton, local branch of the Moline Plov Company, is having a large building constructed which it will use as a dry-kiln.

Having finished the season's cut, the mill of the Shawano Lumber Company, Shawano, Wis., has closed down for the season. The crating mill is to be transferred to the veneer factory. Negotiations for the sale of the sawmill to the McIwen Box and Veneer Company are pending.

The Kneeland-McClurg Lumber Company, recently organized at Phillips with \$1,000,000 capital invested in taking over the holdings of the John R. Davis Lumber Company, has closed a deal with M. J. Bell of the Bell Lumber Company of Ashland and Minneapolis, whereby the latter buys the stumpage on the land being logged by the Phillips concern.

The Merrill Veneer Company, Merrill, Wis., has again resumed operations and the mill is running at full capacity. The plant was closed down several weeks ago on account of the lack of raw material.

The new sawmill of the Mosinee Land, Log and Timber Company at Mosinee is almost completed and operations will commence shortly. A steam log hauler, with a capacity of ten to twelve sleighs at a time, is bringing the logs from the two camps, three and seven miles from the city.

A force of men is cruising the timber lands of the Atwood Lumber Company, the Chippewa Lumber & Boom Company, and the Mississippi River Lumber Company, and it is said that the Edward Hines Lumber Company is negotiating for the purchase of the timber on about 130,000 acres. The timber is mostly hardwood and hemlock, and should the deal be consummated the sawmill at Hayward would be operated for several years to come. A railroad will possibly be built from Hayward into the timber to connect with the sawmill.

The Holt Lumber Company, of Oconto, has acquired fifteen forties of

timber land in Marinette county from C. Constine & Son, of Peshtigo. The Holt company will log the timber next winter with other timber it owns in the same vicinity.

The Rice Lake Lumber Company, Rice Lake, Wis., recently entertained about two hundred employes at the main office of the company with a banquet, followed by a party at a local theater. This is an annual event and has helped greatly toward establishing the mutual goodwill and cordiality between this company and its employes.

Edward Bradley, a retired lumberman and well-known citizen of Milwaukee, was stricken with apoplexy Christmas morning and died several days later. He was seventy years old.

Captain David Jack, vice-president of the Gurney Refrigerator Company of Fond du Lac, died recently at Rochester, Minn., as the result of pneumonia following an operation. Three special interurban cars left Fond du Lac with employes of the company who attended the funeral services at Oshkosh. Mrs. Jack died about six weeks ago.

A wireless from the liner Orferie, seven days this side of Yokohama, reported the death of O. B. Osborn, vice-president of the Berlin Machine Works of Beloit. Although Mr. Osborn had been in poor health for some time, his death was a great shock to his friends. He started on a combined business and pleasure trip for the Far East about the middle of November. Mr. Osborn is survived by his wife, two sons and one daughter. The body has been embalmed and is being returned to Beloit for interment.

DETROIT

Total building operations in Detroit during 1912 reached \$25,588,470, a new high mark for the city. In 1911 the total was \$6,575,800 lower than the year just closed. During December permits for new additions and buildings amounted to \$1,506,000. Of these permits 242 of the new buildings are to be of wood construction and of the additions 46 are to be of wood construction.

Thomas Forman of the Thomas Forman Company says that the flooring trade started the new year in flourishing condition. The Forman factory is busy with a good volume of orders on hand and inquiries plentiful.

The Dwight Lumber Company's flooring factory is also running full time and Secretary John Lodge reports that trade conditions were never better. The flooring men are looking for a continuance of good business right through 1913.

J. M. Clifford says that while stocks are moving fast, a good deal of difficulty is being experienced by lumber dealers in getting railroad shipments. A railroad embargo at Toledo on shipments from the South has seriously affected Detroit dealers, and although this embargo has been lifted, many southern shippers of hardwood lumber have been holding back. The result is that many dealers are running extremely short on stocks. Mr. Clifford says that he expects further advances in prices of all hardwood lumber with the exception of poplar. The later stocks are quite plentiful and the demand is comparatively small.

George I. McClure reports that business is very good in all kinds of hardwoods, with birch, maple and elm leading. In the first three days of the new year Mr. McClure sold more than 350,000 feet of hardwood, which he considers not a bad start.

Mr. Scheurman of the Scheurman Lumber Company of Saginaw was a visitor in Detroit last week.

Detroit and Indiana capitalists have purchased 7,000 acres of hardwood timber land in Springdale township, Manistee county, from the Fruit Belt Land Corporation. It is expected that it will take five years to clear the land. This is the largest single tract of hardwood left in Manistee county.

The Fox & Mason Furniture Company of Corvina has increased its capital stock from \$260,000 to \$300,000. At present the company is employing 150 men. The higher grades of furniture, mostly Circassian walnut and mahogany, are made at factory "A," while imitation quartered oak goods are made at factory "B." An addition to factory "A" will probably be built within the next few months.

The Hardwood Market

CHICAGO

Market conditions in Chicago are typical of conditions throughout the country. Considerable slacking in orders was noted during the early part of the past fortnight, but large concerns are gradually closing their 1912 business and are again getting back into the market in first-class shape. The volume of orders for the next week or ten days will probably be comparatively light, but they will come in in increasing numbers and size. Every confidence is expressed that the present firm prices will hold, at least, until the advent of the summer season, although local yard men, wholesalers and mill representatives state that they can not see any possibility of the present shortage of supply being entirely eliminated before that time.

The usual order of strength of the various woods is being maintained, as it has been for several months past, and plain oak is about the strongest item, quartered oak continuing to increase in demand and

price. All the northern woods are in pretty firm request, birch and maple being the leaders. Red gum still shows some weakness, although some concerns report a strengthening in demand during the last week or two.

NEW YORK

The hardwood market at New York which has shown such strength for the greater part of the year just closed, continues strong and active. The fact that low grades are in better demand is by no means the least encouraging feature. Supplies are difficult to attain and the report is that stocks at mill points are low and broken. The demand seems to be heavier for plain oak and ash, and these have shown an advance in price, in some cases of as much as two dollars; ash is particularly strong and high in price. Maple, birch, chestnut and poplar are in good demand and prices steady. There is no reason to expect a falling off in prices of hardwoods generally; on the contrary it is predicted that the future will see a steady demand and, if any change in price, the tendency will be upward.

BUFFALO

The hardwood trade is naturally feeling the effects of the holidays and the inventory season, but the outlook is good and a fair amount of lumber has been sold for delivery ahead. The yards look to see this an active year, with the same strength to prices as last year. There are no weak spots among hardwoods and if business keeps up as is hoped for, it would not be surprising to the trade if some advances in prices were made.

Plain oak holds the lead in sales and is maintaining its strong position in both white and red stock. Chestnut and ash are also quite firm. Birch and maple are being called for quite frequently and are strong. Dealers handling beech state that there is a good call for that lumber. All flooring is holding up at a pretty high level of prices.

PHILADELPHIA

It is the general pronouncement of lumbermen that 1912 has proved a satisfactory year in nearly every line of the business. Signs are numerous that 1913 may be looked forward to as a record-breaker. A somewhat subdued activity is always anticipated at this time of the year, but owing to the depleted pile, both at the manufacturing and the consuming ends, a comparatively lively traffic is still going on as every effort is being made to secure stock ahead. The concerted action of the trust companies and extensive operative builders to keep the operation work within limits during the year is already showing good results, as many plans are now under way for large operations to begin as soon as the weather permits.

The relative positions of the hardwoods continue unchanged. Plain red oak, which heads the list both in demand and price, is closely followed by white oak; quartered oak is still advancing; ash is moving up, orders increasing and prices strengthening; chestnut holds a good place; poplar is steady, with increased demand in low grades; maple retains a good position; birch, beech, cherry and basswood are all in good call; cypress shows a little more life; mahogany is growing stronger.

BOSTON

While the demand for hardwood lumber has ruled rather quiet for the past two or three weeks, there has been no abatement in the strength of the market. Practically all reports from producing centers indicate that holders of hardwood lumber are not anxious sellers. Exceptions are reported from time to time where some manufacturer is forced to get ready cash and therefore makes a sale at a slight concession. Such cases, however, are not numerous at the present time.

A good demand is expected for hardwoods as soon as buyers have figured their stock sheets and find out just what they have on hand. Most buyers will be ready to talk buying by the middle of this month, but dealers do not expect a really active demand while the high prices rule. In plain oak there is talk of a still further advance. Quartered oak is also considerably firmer and a fair demand is reported. Maple is in fair call, and whitewood has had a very good demand. The high prices of all hardwoods and the small offerings of good stock has led to much buying of the lower grades to be used as substitutes for the better grades.

BALTIMORE

The new year has begun and the hopes and expectations of the members of the hardwood trade run high. Although the movement of stocks has been restricted in the last two weeks, this did not in any sense imply weakness in the trade, but reflected the sidetracking of attention from ordinary matters by such details as taking stock, the closing of accounts, the striking of balances and the readjustment of office affairs generally. If business has been uneventful, it was not because the demand had eased off or the inquiry lessened, but solely for the reason that there were other things which could not be deferred.

Now that the routine of trade is being taken up again, it is noted that all of the hardwoods are strong, with oak perhaps higher than it has ever been, and both the domestic and the foreign demand of impressive proportions. The predictions of last year that the mills would catch

up with the demand and that prices would decline have not been realized, the inquiry being, on the contrary, more active than ever and the outlook most encouraging. The postponement of transactions in the last fortnight must be made up by a correspondingly more urgent request for stocks, and in the absence of extensive accumulations at the mills there is every prospect that the quotations will go still higher. It does not seem to be so much a matter of price now as of ability to fill orders, the mill or wholesaler who has the lumber being the one to get the business. This applies to practically every division of the trade, with perhaps the single exception of extra wide poplar, which remains sluggish and is not responding at all to the activity that prevails in other divisions. As for chestnut, even sound wormy is being taken up with decided freedom and at values which are very satisfactory.

The outlook for the export trade is very promising. Foreign buyers, finding that they cannot buy lumber at the old prices, are inclined to meet the new figures, and in the main the basis of doing business is decidedly acceptable. Stocks are going forward in large quantities and there is every indication of a continuance of the movement. Shippers to foreign countries have learned by experience that there are many pitfalls in the export trade, and there is a general disposition now to conduct business upon a sounder basis than has been the case at different times in the past. Foreign dealers are still coming over to determine for themselves just what there is in the reports of higher quotations and of advanced freight rates, and the interest in supplies is almost acute.

◀ COLUMBUS ▶

Despite the holiday period, which is usually dull in the hardwood trade, business in most lines has been active. Prices are ruling firmer and inclined to advance, and strength is the principal feature of the trade. There is apparently not the usual lull attending upon the semi-annual inventories of retailers and manufacturing establishments. Demand has been good from factories and from dealers. The former probably has developed the best demand because of the great expansion in manufacturing during the latter months of 1912. Factories engaged in manufacturing furniture, implements, vehicles and automobiles are perhaps the best buyers in the hardwood field.

Stocks are light in every locality. Mill owners are manufacturing fast in an endeavor to increase stocks but the demand has been insistent and the car shortage is mitigating an accumulation of stocks. Retailers' stocks, as has been the case for some time, are very light. The car shortage is interfering with shipments although some improvement in that direction is reported recently. Collections are good.

Quartered oak is in good demand and advances have been made until firsts and seconds are now selling at the Ohio river at about \$83. Plain oak is also in good demand and recent advances are recorded. Poplar is another variety which has developed considerable strength. The wide sizes are wanted by automobile factories. Chestnut is strong and all grades are higher. Ash is improved and the same is true of basswood. Other hardwoods are unchanged.

◀ CINCINNATI ▶

The hardwood situation is in very good shape, and prospects for a big year are most promising. Dealers view the situation with more confidence than for several years, and unless the unforeseen happens, one of the best years in the hardwood trade is before us. There are a number of reasons for the existence of this optimism. In the first place there is only a very limited supply of dry stocks at this time, and the present demand, except during the holidays, has been quite up to the production. All wood consuming factories in this section are busy and have plenty of business in sight to keep them running for some time to come without new business, and with the country generally prosperous, it is only reasonable to suppose that they will be able to secure considerable new business. This applies to the furniture trade especially, and the planing mills, implement works and the box factories have nice business in sight and are busy at present. Lumber dealers all over the country are having more or less trouble in securing their requirements, and as the season advances will be up against a more serious lumber shortage than existed last year. Manufacturers in the producing field are well supplied with logs, and are putting forth every effort to increase the output. They are well supplied with orders and anticipate plenty of business. Top prices are being asked for every item on the list. Dealers who are forced to place orders at the big mills are up against stiff prices which are none too high when the ever increasing cost of stumpage together with the increases in cost of labor of all kinds is considered. Prices are not too high; they are right and not at all likely to go any lower.

Plain oak is in best demand in years; quartered oak is selling readily, No. 1 common grade being very much sought after. Good grades of poplar seem to be stronger and moving better, while the low grades are very scarce and high in price. Low-grade cottonwood is very hard to find, and the same grade of gum and other hardwoods suitable for box making and packing is in much demand. Thick ash is hard to get and stiff prices are being obtained for this stock by those who have it.

◀ TOLEDO ▶

Owing to the exceedingly heavy drain made upon local lumber yards throughout the season and until the past week, together with the hand-

The Aristocrat of Woods

MAHOGANY

In Veneers and Lumber

☐ There is *mahogany* and *mahogany*. Sundry woods are sold for mahogany that are not mahogany, and much mahogany that is sold is of an inferior quality.

☐ The Willey system of mahogany production involves stationing at every foremost fancy log market in the world a competent buyer, with instructions to purchase *only the largest and best figured wood*, which purchases constitute but a small percentage of the total offered for sale. *Quality is first consideration—price secondary.*

☐ These logs are shipped to the big Willey plant at Chicago, and each of the big sticks is carefully analyzed for surpassing figure, and such as are suitable for high-grade veneers are painstakingly flitched for this purpose.

☐ Of the nearly five thousand mahogany logs handled at the Willey plant during 1912, less than three hundred and fifty were counted of such a quality as to be up to the standard of the Willey veneer product. The remainder were manufactured into lumber.

☐ This system simply means that the Willey mahogany veneer product is *the best that exists*, and that the greater portion of the Willey mahogany lumber is high-class *figured wood*.

☐ The best in figured mahogany veneers or lumber costs the buyer little more than the ordinary product of the average mahogany producer.

☐ Users of mahogany visiting Chicago are earnestly invited to call and inspect the Willey plant and veneer and lumber warehouses on Robey Street, near Blue Island Avenue. Take Blue Island Avenue car at the Postoffice to Robey Street.

to-mouth policy pursued by dealers generally, local stocks are badly depleted. Dealers have held back as much as possible because of the extremely stiff prices, hoping that a break would follow. Thus far there is no indication of a break in any line, firmness being evidenced in every department of the lumber trade. Dealers find they must buy at least enough to fill in their depleted stocks and to take care of present needs, which are unusually heavy for this season of the year. There is no inclination to buy as an investment, but liberal orders are being placed for present needs.

The building trades have had a phenomenal run during the past year and the coming season is bound to be an improvement on the past owing to the enormous amount of building for which plans are now being drawn and contracts let. The furniture factories are running well and vehicle factories are also calling for a good run of material. Taken altogether, dealers are finding nothing to complain about except the car shortage and that has eased up some in the past two or three weeks. Should the present bad weather continue there is likely to be congestion; but in that case the lumberman's needs will not be so pressing.

< INDIANAPOLIS >

Hardwood men of this vicinity believe that the outlook for an excellent business during 1913 is very encouraging. While the present volume of trade is not above normal, considering the season, it is quite satisfactory. Most of the hardwood and veneer mills as well as the wholesalers are busy.

There is very little complaint of car shortage at this time. General reports are that the best demand now is for all grades of oak and poplar. Prices are steady and show no signs of a break in the near future. Shipments are moving with some degree of promptness. Retailers are showing a little more disposition to replenish their yards than they did a few weeks ago.

< MEMPHIS >

Bank clearings in Memphis during 1912 broke all previous records with a total of about \$420,000,000 as against \$360,000,000 for 1911. The gain per month was approximately \$5,000,000. The lumbermen made their contribution to this excellent showing, as they did considerably more business in 1912 than during any year since 1907. They not only did a large business but the amount of money involved was much heavier owing to the fact that prices were higher.

Most of the lumber firms here have been busy during the past few days taking inventories and getting things in readiness for the new year. While it is impossible to go into details or to tell the exact earnings of any particular firm, it may be said in a general way that the past year was a prosperous period for the lumbermen. They had some very serious handicaps with which to contend, including the flood in the Mississippi and the shortage of cars which tied them up several times. They have also had to contend with advances in freight rates and with discontinuance of through bills of lading on export shipments on the part of the roads west of the Mississippi river. They have met these conditions, however, and have enjoyed greater prosperity than for a long while.

The feeling at the beginning of the new year is one of confidence. It is anticipated that there will be a continuance of the good demand recently in evidence and it is further felt that prices will be well maintained. The car situation is considerably easier now than for several months and this means that it will be possible to move both lumber and logs with greater freedom. Export business looks particularly good. Many orders from Europe have been booked recently and there is a large amount of hardwood lumber to be forwarded to foreign ports as fast as it can be moved under present somewhat unsatisfactory conditions. Reference is had particularly to the withdrawal of through bills of lading and to the consequent necessity on the part of exporters west of the Mississippi river to ship their lumber to the ports on local bills. There is not a large amount of dry stock available at the moment and this is perhaps the one feature which will go further than any other toward restricting the volume of business. On the other hand, it is regarded as a favorable factor in the respect that it will enable owners of lumber to secure full prices.

< NASHVILLE >

The local hardwood manufacturers and dealers enjoyed a prosperous year in 1912—one of the very best in their history. They had practically all the business they could handle. Even the holiday trade interfered but little with their rush. Now that the holidays are over and the first of the year has come and gone, most companies are busy with their annual inventories, but even with this inquiries are steadily coming in, the year starting off in a way which conclusively indicates prosperous times during the coming twelve months.

The general tone of the market is firm. The demands for oak, ash and other lines have been so heavy that somewhat depleted stocks were insufficient to meet them and the customary stocks, estimated to average here about 100,000,000 feet, are estimated to be fully twenty per cent below normal. During the past year prices on some grades of hardwoods advanced several dollars per thousand feet. In 1912 the building permits exceeded any previous year and 1913 promises still better results. Railroad demands are still very active and the same is true of calls from

car companies. Box manufacturers and planing mills were busy right up to Christmas, the former being especially after lower grades of hardwood. Plain and quartered oak leads in present demands and nearly all grades of oak are in good call with light stocks. There is a good demand for red gum in nearly every grade except firsts and seconds. Low-grade poplar is selling well and there is improvement in the better grades. Hardwood flooring is active and prices stiff. The logging season is opening and some good shipments have been received locally from the upper Cumberland river.

◀ BRISTOL ▶

Lumbermen here report trade brisk and splendid prospects for the year. Prices continue stiff, and it is believed that if the present scarcity of stocks continues, prices will be considerably higher before many months. Many lumber concerns here are looking about for more timber to increase their output. Several large new mills are now being installed and will soon be in operation.

◀ LOUISVILLE ▶

As soon as could have been expected after the opening of the new year, the demand for lumber made its appearance in normal strength. During the latter part of December trade fell off considerably, as far as new orders were concerned, but in view of the fact that both lumbermen and their customers were making annual inventories this didn't matter much. Business was kept up by the shipments on old orders, and as trade had been brisk prior to that time, there was no lack of work for the yard crews. In fact, by dint of getting out a lot of lumber on orders already booked, some companies made December the largest in their history, while November, with normal conditions prevailing as to shipments, was the best ever for some concerns. January has done exceptionally well thus far, and seems likely to hold up the excellent run of business which has been enjoyed for the past five or six months. Plain oak, quartered oak, ash, hickory, cottonwood and gum are all in good demand. Poplar has improved noticeably of late. Prices are steady to firm, and there is not likely to be any material change unless it should be seen that demand is running ahead of production, in which event still further increases are likely to be brought about.

◀ ST. LOUIS ▶

Hardwood conditions continue along the same lines as they have for some time. During the past few days business has been quiet, owing to the holiday season and stock-taking time, but it is seasonable with all that and was expected. Salesmen of the various yards have been home for the holiday season but intend to return to their territories within the next few days. Those interviewed while in the city stated conditions in the sections they cover are most favorable for a good spring business. They stated that oak and ash are having a good sale at stiff prices. Poplar is not selling as well as it did. Gum and cottonwood, however, are steady sellers. Cypress is selling pretty well, and a good business is looked for in the early spring. Yards making a specialty of cypress are well pleased with the outlook and anticipate a good demand within the near future. The sash and door factories have had a good season before them. On the whole, the outlook is excellent for a most satisfactory spring trade.

◀ MILWAUKEE ▶

The local hardwood trade is beginning to fall off somewhat, owing to the fact that many manufacturing concerns are now in the midst of their annual inventories. The decrease in demand is nothing as compared with what is usually experienced at this season of the year. Just as soon as the inventory work is out of the way the local sash and door plants and other manufacturing concerns will be operating full time and will want plenty of lumber. Stocks at all of these plants are low.

Reports from the northern mills indicate that a brisk demand for lumber is being experienced, but that buyers are finding difficulty in having their orders filled. The scarcity of upper grades has resulted in a better call for common grades, especially in maple, birch and basswood. There is little prospect of securing new lumber in shipping condition for five or six months, and the situation is regarded as serious by many jobbers and manufacturers, considering the scarcity of all dry stocks.

Plain and quartered oak is strong and prices are somewhat higher. Hard maple is selling well and reports from the mills are to the effect that some good contracts have been placed in this line.

◀ DETROIT ▶

The opening of the new year finds the Detroit hardwood market in very good condition. Dealers and manufacturers report a big volume of orders and inquiries. Many dealers are running low on stocks because of delayed freight shipments, due to the embargo which has been in effect at Toledo. Elm, birch and maple have been in steady demand. Oak, especially the two-inch size, is very scarce and the price is steadily mounting. A further increase in prices all along the line is predicted by many dealers. The flooring, veneer and box trades are all very busy, the flooring manufacturers being especially pleased with existing business conditions. Hardwood men are unanimous in their prediction of big business during the spring and summer of 1913.

TIMBER TALKS

Thirty-two years have wrought wonderful changes in values, sources of supply and national regard for timber.

Thirty-two years ago we advised our clients to buy timber; twenty-two years ago the same advice was given; twelve years ago it was reiterated; two years ago we restated our belief in the continued increase in the price of timber and today we reaffirm it.

Acting upon the POINTERS we gave, at the time they were given, hundreds of investors have reaped rich profits.

Knowing timber to be a safe investment and believing our organization to be of value to those contemplating the purchase of timber, we have issued

A BOOK OF POINTERS

in which we have endeavored to crystallize the observations of thirty-two years' timber research.

It was worth our while to formulate "pointers"; it should be worth your while to assimilate them.

GIBSON TALLY BOOK

This three-throw tally ticket cover is made from aluminum, and accommodates four tally tickets—4 1/8 x 8 1/2 inches in size.

Folds compactly to less than one-fourth inch in thickness and fits side or inside coat pocket.

Gives large area of four tickets for complicated tallies, or straight grade can be made on one page.

Accommodates any form of tally ticket desired. Special, patented, triplicate tally tickets supplied, printed on waterproof paper with carbon backs. Tallies made on these tickets are unalterable. Their use enables the inspector to retain triplicate, and forward original and duplicate. Duplicate designed to be attached to invoice.

These tally books are perfection for durability, convenience, accuracy, and for systematizing the inspection and measurement of lumber.

Patent applied for on covers. Copyrighted, 1910. Triplicate Tally Tickets patented.

PRICE LIST

Aluminum Tally Covers, each	\$ 1.00
Aluminum Tally Covers, per dozen	10.00
Patented triplicate Tally Tickets (stock form)	per 1,000 10.00
Single sheet manila (stock form) Tally Tickets,	per 1,000 4.00

Specimen forms of Tally Tickets mailed on application. Covers sold on approval to responsible concerns.

Baldwin Geared Locomotive

Logging Locomotives must operate on steep grades, sharp curves and uneven tracks. This is what the geared locomotive illustrated has been designed to do. It is symmetrical in construction, and power is transmitted to the axles through a central drive. The valve motion is simple and accessible, and all new features have been tried out in service.

This locomotive is well-designed, well-built and fully guaranteed. Various sizes can be furnished, to suit different track and operating conditions.

Saws Driven by Westinghouse Motors.

Westinghouse Motors Save 53% of Power in a Woodworking Plant

TESTS in a woodworking plant showed that it required 180 h. p. to drive all the machines from line shafts, but that only 85 h. p. was needed when each machine was driven by a Westinghouse motor.

95 h. p. was therefore wasted in friction by the line shafts and belts, and represented a continuous loss even if only one machine was in use.

But saving in power is only one of the advantages gained by the use of the Westinghouse motors. Some of the others are:

Machines can be placed wherever desired so that materials can be passed from one process to the next with the least handling.

Belt and line shaft maintenance expense greatly reduced.

Trouble with one machine does not necessitate shutting down others.

Cleaner and safer working conditions.

Minimum fire risk and insurance charges.

These advantages mean greater production at less cost.

These advantages can be obtained in any woodworking plant with properly applied Westinghouse motors.

Westinghouse representatives will, on request, investigate your plant and recommend the proper motors to secure the most satisfactory and economical drive.

THE RUSSEL COMBINED SKIDDER AND LOADER IN OPERATION

Russel Logging Cars are built to stand severe service, of any capacity desired or to suit any length of log.

Logging Economy will interest you

The most convincing proof of any machine's efficiency, next to a personal trial, is the expression of those who have used them.

We shall be pleased to furnish you with the proofs or the names of the operators who will be glad to show you the machines in operation.

The Russel Combined Skidder and Loader has demonstrated itself to be superior in design and construction. The great decrease in cost and increased efficiency of logging is bound to appeal to the operators.

Russel Wheel & Foundry Co., Detroit, Mich.

A Prominent Veneer Man says:

☐ "I believe your new service showing the exact requirements of the Veneer and Panel Trade to be highly accurate, and a necessary part of the office equipment of any progressive veneer or panel factory."

☐ The same information would cost you thousands of dollars. The cost of our service is a small fraction of that.

☐ Ask your competitor to tell you how it has helped him, and then write us for details.

HARDWOOD RECORD,

CHICAGO, ILL.

"CLYDE - GRADE Than which there is None better."

Nearly a thousand lumber companies have proved the economy and efficiency of skidding with the Clyde Skidder and loading with the McGiffert Log Loader. If you are not one of them you will be after you give us a chance to show you; and meantime it's costing you somewhere around \$25 a day to "do without!"

When you buy veneered panels from manufacturers who have been in successful operation for a quarter of a century you may safely depend on the product being satisfactory.

As a consumer of veneered panels you are given the benefit of our many years of experience and are enabled to put best grade of built-up stock into your work—buying it at minimum cost.

We manufacture tops and panels of all kinds—large or small—in domestic and cabinet woods. They are made right and stay right. Samples and prices submitted on application.

We do not claim to be lower in price, but we do claim our PANELS are cheaper in the long run as they

Do you see the point?

It will pay you to write us.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

YOU pay a *little* more for our hardwood lumber than you do for many others', but it's worth *much* more.

With our modern and first-class equipment and expert operatives, we couldn't make bad lumber if we tried to, because the *quality* and *size* of our virgin tough mountain white ash, red birch, yellow poplar, buckeye, maple, red oak, cherry and basswood, averaging less than three logs to the thousand, and 95 per cent sixteen feet, is the best type of hardwood timber growth in the United States, and shows a larger percentage of *firsts*.

If you are a discriminating buyer, let's get acquainted.

"It is not what lumber costs you, so much as what you can get out of it, that decides its value for your work."

OUR OWN MANUFACTURE

Something New For Your Factory Floors

Utility Joined With Economy

We are now manufacturing what we call a No. 2 Factory grade of Hardwood Flooring which can be used successfully in factory buildings where good wearing qualities rather than appearance are required. This Flooring is made from the hardest portion of the log, and while the Flooring shows the heart defect to a considerable extent, nevertheless it will wear with wonderful durability. It is "Rockhard" flooring at a rock bottom price.

It is 13/16 x 2 1/4" face, and the Flooring is kiln dried, hollow backed, bored, end matched, steel scraped and bundled.

Write us about it. This is a grade of Hardwood Flooring you should know about. Address MITCHELL BROTHERS COMPANY, Sales Department, CADILLAC, MICHIGAN.

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

The T. Wilce Company

SECURE BETTER PRICES

AT LESS SELLING COST BY REACHING MORE CUSTOMERS. HARDWOOD RECORD PUTS YOU BEFORE THEM ALL TWICE A MONTH.

ASK US ABOUT IT

Never Touched Us!

On account of widespread and, as usual, exaggerated reports of flood damage in the Ohio Valley, including Louisville, we take pleasure in announcing that the business of this market is proceeding without interruption.

With few exceptions the yards of our members are not close enough to the river to be in danger from floods; and in the cases of those concerns which were in the path of the river the damage was slight and the inconvenience temporary. Business is rapidly approaching normal with these concerns, and they are in a position to take care of the wants of their customers just as before.

The co-operative features of this organization would have sufficed, even if the situation had developed serious features, to relieve buyers of any inconvenience, no matter how slight, which might have resulted from the suspension of operations by individual members. As it is, of course, the necessity for the extension of this assistance has not arisen, inasmuch as each company is now prepared to take care of its own business without trouble.

Inquiries for quotations on hardwood lumber, veneers and panels are invited. The attention of buyers of mixed cars is especially directed to the facilities which we possess in this connection.

HARDWOOD LUMBER **Memphis, Tenn.**

500 Copies Sold Within a Week After Prospectus Was Issued

Hardwood Record announces the issue on March 1, 1913, of an Authoritative Commercial and Scientific Book

American Forest Trees

By **Henry H. Gibson**, Editor *Hardwood Record*
 Edited by **Hu Maxwell**, Wood Utilization Expert

The Work Involves :

First: A botanical description of the more than 300 species of American forest tree growth.

Second: A physical description of the wood of these species.

Third: A recital of the chief uses of all important American woods, together with suggestions of advantageously broadening their uses.

Fourth: Complete information concerning the range of growth of all varieties.

Fifth: Related trees are logically grouped according to families and spe-

cies; important species covered in substantial detail, and brief mention of the woods of minor importance.

Sixth: Scientific name of each tree is recited, as well as the various common names by which it is recognized in different parts of its range of growth.

Seventh: The properties of the various woods are carefully analyzed, particularly weight, hardness, stiffness, strength, elasticity, toughness, color, figure, and seasoning and lasting properties.

☞ The book will contain between 650 and 750 pages, will be printed on the best quality of enameled paper, and handsomely bound in half leather, dark green roan back and corners, with basket cloth sides, silk head-bands, gold stamping on the back, and gilt top.

☞ The work will be illustrated with more than 100 full-page pictures on plate paper in sepia, outlined in orange, from photographs, covering all the chief commercial varieties of virgin forest timber growing in the United States; and also with numerous engravings, from drawings and photographs, showing leaf and flower forms, etc.

☞ The price of the work is \$6.00, delivered by express or mail, and is sold only on subscription.

☞ An order blank, and a prospectus, showing the character of the paper, size of page and style of printing will be forwarded on application.

Review and Outlook

General Market Conditions

In telling of hardwood conditions throughout the whole of the hardwood producing field, one needs go no further than to say that the buyers, who are everywhere evident where there is any lumber to be taken up, do not ask, in looking for stock: "What is the price?" but put the question rather: "Can you deliver the stock?"

This is the greatest concern of the shippers and receivers of hardwood lumber, and there is every reason to believe that this will continue to be the paramount consideration for several months in the future. If steadily increasing demand or abnormal shortage of stock alone featured the hardwood trade, it would be safe to predict that there would be an accumulation of stock within a few months, but with both these conditions decidedly manifest, the situation assumes a different aspect. Hardwoods are scarce—decidedly so.

Plain red oak continues to be the shortest of all the staple items in hardwood, with plain white oak a close second.

From the gum producing territory comes word that the slight recession in demand for red gum, which has been felt up to within a short time ago, has been checked and this wood is again coming back strongly. Sap gum is finding increasing favor in the eyes of the consuming trade in various lines, and is today one of the strongest items in the hardwood field.

Quartered oak continues to show increasing vitality. Values have jumped during the last three months an average of between three and four dollars a thousand. One concern, whose plants are in Missouri, and which makes a specialty of high-grade quartered oak in large quantities, says that three dollars is a conservative estimate of the advances in this stock in the last three months, but this is only in keeping with the increased demand and firmer values that have marked the entire trade.

Flood conditions have somewhat affected shipments, although only temporarily, but the same conditions have resulted in extremely wet logging which will probably be another factor in operating to prevent any abnormal production of hardwood stock in the South during the early spring months.

All the northern mills are operating on full scale, but the continued active demand and the shortage which has marked northern stocks for some time will absolutely prevent undue piling up of stock at northern points. Reports from Michigan points indicate that stock of all hardwoods and even hemlock on hand is more than fifty per cent less than for January 1, 1912, and much of this is already sold.

The Flood Situation in the South

Unusually heavy rains throughout practically the entire territory east of the Mississippi river during the last few weeks have resulted in an unusual amount of water passing through the Mississippi and its various tributaries. The section which experienced the most severe flood conditions was that lying along the Ohio river. It cannot be said, however, that as far as the lumber business is concerned, any serious hardship in the matter of flooded plants has been experienced, although in a number of cases plants have been inundated to a considerable depth. This condition is not generally true, however. The main difficulty has resulted from the interruption and in some cases the absolute suspension of traffic because of the inundated state of tracks and terminals. This has tied up business rather effectively in some quarters and while it has not resulted in any huge loss directly, it has effected considerable inconvenience to a great many members of the trade.

In the Memphis and Arkansas territory no great anxiety was felt during the height of the flood period. The Mississippi at that point reached a stage of about thirty-eight feet. This is three feet beyond the danger line and as a result lands outside of the levee district were overflowed to quite an extent. No great damage was done, however, as where valuable stock was in a threatened position, the owners had time to remove it. Some of the yards experienced pretty wet conditions and a few of the plants were shut down on account of high water.

At Cincinnati the chief trouble was encountered in making shipments, on account of extensive rains which washed out bridges and tracks, and made freight handling extremely difficult. Two or three plants in the hardwood, veneer and similar lines were flooded entirely, while in other cases high water made it extremely difficult to operate in the vicinity of the plants and they were shut down temporarily. No great damage was done, however, in any case, and the loss in lumber is practically negligible.

At Louisville, on what is known as "the Point," several concerns were forced to shut down because of flooded plants, but no great loss was experienced. As at Cincinnati, the greatest hardship resulted from the inability to make shipments on orders. In some cases considerable quantities of high-grade stock were threatened by the rising waters, but it was possible to remove the stock to safer quarters in time to prevent its being flooded. For the most part, valuable machinery that would have been affected by inundation was removed in time to prevent damage.

In the Ashland district very little damage was inflicted upon

the lumber business. Here, as in other points, sufficient warning was given to enable the lumbermen to remove their stocks to high points; hence the loss by lumber carried away or degraded was practically nothing.

The Cumberland river caused considerable damage at Nashville, where quite a quantity of logs, lumber and similar products were carried away by the floods. Several of the yards were inundated, but not to the extent that any great loss would be sustained on account of degraded stock.

The improved condition of the levees at Cairo which resulted was effected after the previous flood conditions, had the effect of preventing entirely the flooding of the lumber territory in Cairo and adjacent points. No anxiety was felt during the flood stage, as every confidence was felt in the ability of the strengthened levees to withstand the flood pressure.

Reviewing the whole situation as far as the effect of the unusual rains and resulting floods on the hardwood business, there seems to have been relatively small damage done directly to stock or to plants. Ample warning in most cases gave plenty of time to remove lumber and machinery. When the railroads have straightened out their lines and reconstructed washed out bridges and tracks, the ill effects of the flood condition will have become a thing of the past.

Relative Demands for Hardwoods for 1913

For over five years HARDWOOD RECORD has been engaged in carefully collecting and tabulating information showing the specific requirements of the wholesale hardwood buyers. This information has been gathered directly from the consumers of hardwood and is collected as a part of the vast amount of information made available to the patrons of HARDWOOD RECORD. The service is growing rapidly and with the purpose of keeping it up-to-date, every concern listed is either written or called upon personally once a year, and from each one is secured a notation of any changes regarding the article manufactured, the personnel of the company, and the proposed consumption for the ensuing year.

HARDWOOD RECORD is now engaged in compiling such a correction bulletin, revising the whole of this service up-to-date. This information will be issued in pamphlet form in the course of two or three weeks. Thus the whole of this service will be made doubly valuable and available for quotations on stocks which will be in most active demand during the coming year.

While this service was created primarily with the idea of maintaining a bureau of detailed information, it is natural that in course of collecting such data, it is possible to make observations as to the probable tendency of the hardwood consuming trade regarding the various woods of importance during the coming year. Inasmuch as the new bulletin will involve over one hundred pages of changes it is very apparent that the demands of the consuming trade during 1913 will be materially different from those of 1912. One of the most notable changes in requirements as seen from a careful perusal of the letters received from these consuming factories, is the remarkable development in the demand for sap gum. The increasing favor of this wood is not limited to any one line, but seems to have found a favorable introduction in a great many lines of consumption. In furniture, molding manufacture, manufacture of picture frames, manufacture of ladders, chairs and in many other lines, sap gum is noted as being one of the strongest woods in demand for the coming year. The great scarcity of maple during the past few months has in some instances resulted in the replacing of this wood with sap gum. The two woods are not closely similar in physical structure, but manufacturers of furniture, molding and kindred lines seem to have found it an acceptable wood for their purposes.

Mahogany and birch have both shown marked increase in demand and consumption as seen in reports referred to. Several concerns report an additional consumption of oak flooring and reduction in consumption of maple.

Summarizing, the features which will characterize 1913 business,

which seem most evident in an analysis of the bulletin information, are a greatly increased demand for sap gum, a material increase in the use of birch, steady increase in oak, both plain and quartered, in keeping with the normal increase of demand for all hardwoods.

Clearing Logged Off Lands

The picture on the cover of this issue of HARDWOOD RECORD illustrates an operation which is becoming familiar in many regions where extensive lumber operations are carried on. It shows how loggers are being followed up by land clearers. The illustration shows one of the powerful machines, made by the Clyde Iron Works of Duluth, Minn., at work on cut-over land, piling the tree tops, defective trunks, and other debris, and making the land ready for the plow. This shows the second step in the operation of converting forests into fields. The first step consists in taking out all the merchantable timber and delivering the logs to the sawmill; the second is taken when the refuse is piled ready for the fire which later burns the heaps and completes the clearing of the land.

This matter has received much attention in recent years in the North and South, and likewise in the Far West. The demand for agricultural land is so strong that the farmer now follows the lumberman much closer than formerly. The most serious problem now is to clear the land. When loggers have done with it, the ground is generally strewn with limbs, logs and trash that must be removed.

The old plan of clearing land, followed in the days of the pioneer, was to have log rollings, when all the neighbors were called together, and with a day of frolic and hard work a couple of acres were made ready for the plow. That method is too slow now, and, besides, it is out of fashion. The man who owns woodland or cut-over land that needs clearing, does it himself with the assistance of hired help.

Powerful machines have been made especially for that purpose. Some pile logs, others pull stumps. Steam takes the place of muscle in the hard lifts. One machine, with a small working force, will do as much in a day as a large company of old time log rollers could do in a week.

Sometimes a company owns the machine and clears by contract; sometimes the owner of large tracts clears the land and makes his money by selling it ready for the plow; and sometimes a number of small owners join together and buy a machine which clears land for all the owners, and then take contracts of clearing land for others.

The business has grown to large proportions. Thousands of acres of cut-over land are given yearly to the plow in various parts of the country.

In addition to the benefit to farmers in thus securing fresh land at very moderate prices, timber owners are also benefited. Every acre of cut-over land that is cleared lessens the fire risk in adjacent timber tracts because land, covered with offal of an inflammable nature, constitutes a veritable fire trap. Cleared fields are isles of safety in forested regions. The quicker the land can be cleared after the loggers pass on, the less food there is for fire, and the less menace to neighboring wooded tracts that are still uncut.

Car Surplus and Shortage January 15

A statement from the American Railway Association dated January 22 gives an interesting comparative summary of car surplus and shortage from October 11, 1911, and gives also a statement of car conditions up to January 15, 1913. The car statistics are compiled in detail by groups under which are noted the various states in each group. The number of roads under each group are compiled statistically, showing the surplus and shortages in each type of car. A comparison of surpluses and shortages in chart form is also given.

A summary of car surpluses and shortages from October 11, 1911, to January 15, 1913, shows that the total surplus January 15

was 53,230 cars; December 31, 1912, 50,650 cars; January 17, 1912, 102,479 cars. The total shortage for the same respective dates was 24,791, 33,601, and 12,194. From these figures it can be readily seen that the car situation was somewhat improved. The difficulties of securing cars during the last few months are also very graphically shown by the comparative figures.

Compared with the preceding period, it is shown that from October 11, 1911, to January 15, 1913, there was an increase in the total surplus of 2,571 cars. There was also a decrease in the surplus of coal cars amounting to 4,672.

In total shortage, the period denoted shows a decrease over the preceding period of 8,810 cars, while January 15, 1913, showed decrease of total surplus as compared with the same date for 1912 of 49,249.

Expert Advice on Journal Advertising

On any specific question bearing on any phase of modern business, the up-to-date business man concedes the value of expert opinion. He employs lawyers to give expert advice in legal matters; he has traffic men to handle his traffic matters in an expert manner and in various other departments of his business he counts on the advice of the coterie of experts whose services are available. It is to be hoped that eventually the average lumberman will realize the possibilities of strengthening his sales system through a well thought-out and not too restricted campaign of trade paper advertising. But it is evident that in order to arrive at any satisfactory method of procedure in this matter the lumberman of today must necessarily have expert advice on this question. After employing such advice, the first thing he wishes to learn is something about the character of the mediums he should employ for exploiting his goods through the trade press. On this score the reflections of the editor of a paper devoted to advertising and selling covering questions and answers which have particular bearing on trade paper advertising should be of value.

The questions were propounded at a recent meeting of the Technical Publicity Association and the answers as compiled showed the consensus of opinion of the members in attendance. One of the questions was as to whether an advertiser with a limited appropriation should carry a small space in several publications or pick out one or two particularly adapted to his line and concentrate on them. To this twenty answered that they preferred to concentrate on one or two publications.

A second question raised the issue as to whether the weekly or monthly journal is the more effective in the same field. Twelve of those in attendance stated that they would prefer carrying advertising in the monthly publication, while only five showed that they preferred the weekly.

One of the members suggested that in some fields there are certain papers whose circulation is restricted to a single phase of work in that field. It is therefore limited in quantity but select in character. Seven of the members in attendance preferred advertising in such a publication rather than in the general publication which was endorsed by only two.

By vote of twenty to one, the convention expressed its non-belief in the value of anniversary, convention, souvenir and other

special issues, preferring to spend their appropriations in regular issues of the same periodical. It was found to be the expressed belief of these experts in advertising and trade journal work that advertisers should have personal acquaintance with the editors of technical and trade publications.

Lumber Trade in Great Britain

United States Commercial Agent E. P. Secker has made a report covering various phases of the lumber trade in Great Britain. It is shown that a shipper in the United States usually contracts to deliver to a merchant in that country, within a specified time, certain lumber of a particular grade and specification at a given price at particular port or ports. The transaction is conducted through an agent, but there are some variations from this course. Some shippers have direct dealings with consumers; some merchants eliminate the agent and deal with the shipper; while agents have attempted to do business direct with the consumers. There are certain limitations to direct dealings between producer and consumer, and they are perhaps more evident in the lumber business than in most other lines.

Lumber merchants in Great Britain frequently have cause for complaint against shippers in the matter of nonfulfillment of contracts. Some shippers ignore their obligations when market prices rise during the currency of contracts, and when prices fall make shipment in excess of those called for. Another cause of complaint is delay and irregularity in shipments. The question of consignments is of paramount importance. Consignments always make for lower prices more than the keenness and business sagacity of buyers and all other forces combined. To illustrate, let it be supposed that contracts have been made, say, at \$40. In due time the lumber arrives and in the same steamer there are consignment parcels of similar grade. Obviously the market price is \$40, but the quantity arriving in addition to the contract goods is more than the market can absorb. The result is that lower

prices must be accepted in order to clear the surplus. Merchants who have to face the prospect of loss on their contract goods are in an unenviable position. They, of course, can buy the consignment parcels, but even working on an average cost this puts them at a distinct disadvantage as compared with competitors who deal mainly in consignments. It frequently happens that, should merchants decide to absorb the arrivals of consignments for a time at prices which look cheap, they find further quantities arriving and prices go down again.

Hardwood lumber, especially the better qualities, is used more freely in London than in any other port. Quarter-sawn oak meets with severe competition from wainscot, Odessa, and other kinds. Ash, too, meets Hungarian competition to some extent. There is a good market for No. 1 and No. 2 common lumber for cheap furniture, and the demand is capable of expansion if properly catered for. Generally speaking, log timber is not much sought by buyers, consequently wood in this form is not sold to advantage apart from the limited demand that exists. Storage of lumber at the docks is somewhat expensive, and on this account regular shipments are desirable.

Liverpool is undoubtedly the best port for local business and

by far the best for transshipment purposes, both coastwise and abroad. Lumber is often seen on the quays which has arrived in transit to such far distant countries as South Africa, Australia, and New Zealand; a fair volume also passes through to various places on the continent of Europe. Liverpool is pre-eminently the importing center for wagon oak planks and scantlings. It is probably of more importance to American shippers than all other ports in Great Britain combined. Liverpool is a cheap port in which to handle or store timber, and its location makes it an advantageous market for both buying and selling wood goods of all kinds.

The lumber trade in Manchester is conducted by local firms, and also by Liverpool merchants. Most of the wood imported consists of softwoods from Canada and the Baltic, but there is a growing trade in hardwoods.

All kinds of lumber suitable for shipbuilding finds a ready and fairly steady sale in Glasgow. It is a place that favors log timber rather than lumber. In the south and east of Scotland there are numerous cabinet makers who specialize in the making of furniture, mainly for the London trade.

The trade of Belfast, Dublin, and the Bristol channel ports is partly done by direct and transit shipments and partly by Liverpool and London firms.

There is now a much better relationship between merchants and shippers of wagon stock, and the latter should give every care and attention to grading. Quarter-sawn white oak is meeting competition from Japanese timber. Quarter-sawn red oak has anything but a promising outlook. The outlook for thin and plain stock is good. Coffin planks are slowly but surely giving place to red coffin boards. Square and round American logs appear to be giving way to cut stuff.

Yellow poplar at moderate prices usually holds the field against all competitors. Northern-grown wood sells best, but the recent improvements in the manufacture and grading of the southern product has resulted in higher prices for the latter, provided the stock is free from black stain in the heartwood. In this, as with most woods, the tendency is to import sawn and otherwise manufactured boards rather than logs. Cottonwood, tupelo and magnolia are competitors, but can only be sold as such at low prices.

The importation of ash and hickory, used mainly for coach building and bending purposes, is chiefly in the round log. Red gum logs are seldom seen. The demand for red gum lumber is steady. This wood and the lower grades of oak and walnut supply practically all the requirements of the cheap-furniture trade. Sap gum (hazel pine) for coffin bottoms is a favorite. Black walnut logs find a ready sale. Skating-rink floors laid with maple have proved an excellent advertisement. Now architects are insisting on it for schools, public buildings, private mansions, and mills.

Shippers should exercise more care in grading lumber. Complaints are also heard as to disregard of details on the part of shippers, which is annoying to both merchants and consumers. The matter of bundling is of vital importance and shippers should give consideration to the views of merchants as to the best materials and methods. The condition of the lumber when it is delivered at final port of discharge is the best criterion by which to judge the value of the different methods, and it is the merchant, not the shipper, who is in position to pass judgment on the efficacy of the bundling methods employed.

Shippers should also give more heed to the wishes of buyers as regards marks. There is always a valid reason for including in the contract a stipulation that goods shall bear a certain mark or the buyer would not take the trouble to insist upon it. Cleating the ends of thin stock with wood is another detail which is often disregarded and to which more attention should be given.

State's Rights Again

The doctrine of state's rights has figured in the history of this country in many ways and during a long period, but the latest effort to apply it comes from a new quarter. It is in the form of an attack upon the government, particularly upon the Forest

Service, on account of its policy of closing the avenues by which large companies and corporations formerly came into possession of valuable timber areas, mining districts, and water power sites, without duly considering the public interest. A change has taken place in recent years. When the western timber lands were turned over to the Forest Service for administration, they were held for development, not exploitation. Attempts to gain control of valuable resources, by the old methods, failed. Then began attacks for the purpose of breaking down the policy, discrediting it, and opening the old avenues again. These assaults have continued several years, and have failed to accomplish what was intended. The latest turn has been an appeal to state's rights. The doctrine is now advanced that those resources, the timber, pasture, water power, and minerals, belong to the states in which they happen to lie, and that the government should turn them over to the states.

The purposes back of this demand are not difficult to fathom. Those who have endeavored to secure control of these enormous sources of wealth, which belong to the whole people, have not succeeded. Between them and what they wanted stood the Forest Service. Their attempts were hindered, blocked and defeated by that branch of the government into whose keeping the resources have been placed. This explains the demand that those resources be taken out of the Forest Service's hands and given to the respective states. The powers that have been trying to get hold of them believe that better success will attend their efforts if they are permitted to deal with state legislatures.

They doubtless know what they want. More than one state legislature has been captured in the past. With the government out of the way, the chances of getting control of resources of great value will increase and the corporations which are grabbing for those resources know it. Hence the sudden agitation of the state's rights doctrine in certain quarters. The government should hold, administer, and take care of what it has, for the benefit of the people to whom it belongs, and when it parts with ownership of any of it, let the ownership go, as the laws specify it shall go, to small owners who want to use it, and not to states or to large corporations. A result of the adoption of this latter policy would mean unregulated grazing of the ranges, with a renewal of the stockmen's wars, and the securing of the best pasturage by the large owners, and the crowding out of the small; lax enforcement of mining laws, enabling promoters to fleece the public with wildcat mines, and acquire valuable timber under false pretenses; the rapid passing of large timber areas to private ownership, and thence to corporate ownership; the removal of cutting restrictions so that timber property could be stripped at once instead of developed on a basis of permanency; and the rapid settlement of lands without regard to their agricultural fitness, in order that railroads and other promoters may profit.

Forestry in the Philippines

The annual report of the Director of Forestry in the Philippine Islands for the year ending June 30, 1912, has been issued. It was prepared by W. F. Sherfese, who is acting director in the absence of Major George P. Aherns. The report deals principally with the business matters of the department, and not with the resources in detail. Some of the matters discussed are of interest to lumbermen in the United States.

More foresters who have had training in the United States seek work in the Philippines than can be employed. This is a change from conditions a few years ago, when it was difficult to induce competent foresters to go to the Philippines.

The islands now have a forest school of their own, and twelve students, educated in the school, are now in the service. It is the policy to employ natives in the forest work, as far as practicable.

Deforested land in the Philippines, or land which never had forests, aggregates 68,000 square miles; and one of the big problems to be worked out is, how to plant this large area in trees.

The Philippines are preparing an exhibit of their commercial woods for the Panama Exposition to be held in San Francisco two years hence.

"Why don't you give him the mitten?" the friend asked.

"It isn't a mitten he needs, it's a pair of socks; he's got cold feet," was the answer.—*Emporia Gazette.*

Ancient History

Lumber Conventions Are Different Now

From the Lumbermen's Primer, published 1900—Drawing and text by Robert L. Stearns.

What is this?

This is the Head-quart-ers of a Lum-ber-man's con-ven-tion.

But don't they have a meet-ing?

Oh, yes, that is in prog-ress now up stairs some-where.

Do they all at-tend the meet-ing?

Bless your heart, no! No one goes but the of-fi-cers and a few oth-ers that wan-der in by mis-take.

What do they do at the meet-ing?

Oh, they read the min-utes of the last meet-ing, for which no-body cares a "dam," some-one reads a ninety-eight page ar-ti-cle on the Har-mo-ny ex-ist-ing be-tween Man-u-fac-tur-er and Job-ber; then they wake up, the of-fi-cers re-e-lect themselves, vote the meet-ing the most en-thu-si-ast-ic ever held and adjourn.

I think I should like to go to a con-ven-tion.

Of course, we all do.

American Forest Trees

ONE HUNDRED-FOURTH PAPER

CALIFORNIA LAUREL

(*Umbellularia Californica*-Nutt)

This tree's range lies in southern Oregon and in California. It is a member of the laurel family and is closely related to the eastern sassafras and the red and the swamp bays of the southern states; but it is not near kin to the eastern laurels which, strange as it may appear, do not belong to the laurel family, notwithstanding the names they bear.

The people of California and Oregon have several names for this interesting tree. It is known as mountain laurel, California bay tree, myrtle tree, cajeput, California olive, spice tree, laurel, bay tree, ovedaphne, and California sassafras.

Those who call it laurel name it on account of its large, lustrous, thick leaves which adhere to the branches from two to six years. All new leaves do not come at once, as with most trees, but appear a few at a time during the whole summer.

The names which connect this tree with sassafras, spice and cajeput are based on odor and taste. All members of the laurel

and the constant appearance of young leaves on the lengthening shoots. It can stand an almost unlimited amount of shade itself, and is by no means backward in giving abundance of shade to small growth which is trying to struggle up to light from below. It delights in dense thickets, but it prefers thickets of its own species.

Its fruiting habits and its disposition to pre-empt the damp, rich soil along the banks of small water courses, are responsible for the thick stands. The fruit itself is an interesting thing. It is yellowish-green in color, as large as a good-sized olive, and looks much like it. Each drupe contains one seed. The fruit ripens in October, and falls in time to get the benefit of the autumn rains which visit the Pacific coast. Since the trees generally grow along gulches, the fruit falls and rolls to the bottom. The first dashing rain sends a flood down the gulches, the laurel drupes are carried along and are buried in mud wherever they can find a resting place. Germination

CALIFORNIA LAUREL. MUIR WOODS, NEAR SAN FRANCISCO

family in this country are characterized by pungent, aromatic odor and taste, and the one under consideration shares these properties in a remarkable degree. When the leaves and the green bark are crushed, they give off a light, volatile oil in folicles which float in the air, like those of an onion, and when inhaled it produces severe pain over the eyes, and may induce dizziness and violent sneezing. Though the symptoms are alarming to one who is undergoing the experience for the first time, no serious inconvenience follows. Dried leaves are capable of producing a similar effect but with less violence. The California laurel's close relationship to the camphor tree is readily believed by persons who inhale some of the oily spray from the crushed leaves.

Attempts have been made to produce the commercial oil of cajeput, or a substitute for it, by distilling the leaves and bark of this laurel. A passable substitute has been manufactured, but it cannot be marketed as the genuine article. By distilling the fruit a product known as umbellulic acid has been obtained.

The California laurel carries a very dense crown of leaves. This is due partly to the old crops which hang so long, and to the tree's habit of lengthening its leading shoots during the growing season.

takes place soon after. The fruit remains under the mud, attached to the roots of the young plants, until the following summer.

The result is that if a laurel gets a foothold in a gulch through which water occasionally flows, lines of young laurels will eventually cover the banks of the gulch as far down stream as conditions are favorable.

The wood of California laurel weighs 40.60 pounds per cubic foot when kiln-dried. That is nine pounds heavier than sassafras. It is very heavy when green and sinks when placed in water. It is hard and very firm, rich yellowish brown in color, often beautifully mottled; but this applies to the heartwood only, and not to the thick sapwood.

Lumbermen have discovered that the wood's color can be materially changed by immersing the logs when green, and leaving them submerged a long time. The beautiful "black myrtle," which has been so much admired, is nothing more than California laurel which has undergone the cold water treatment.

The annual rings of growth are clearly marked by dark bands of summerwood. The rings are often wide, but not always, for sometimes the growth is very slow. The wood is diffuse porous, and

the pores are small and not numerous. The wood's figure is brought out best by tangential sawing, as is the case with so many woods which have clearly-marked rings but small and obscure medullary rays. Figure is not uniform; that is, one trunk may produce a pattern quite different from another. The figure of some logs is particularly beautiful; these logs are selected for special purposes. Sudworth says that none of our hardwoods excels it in beautiful grain when finished, and Sargent is still more emphatic when he declares that it is "the most valuable wood produced in the forests of Pacific North America for interior finish of houses and for furniture."

The wood of this tree has more than ninety per cent of the strength of white oak, is considerably stiffer, and contains a smaller amount of ash, weight for weight of wood. The species reaches its best development in the rich valleys of southwestern Oregon, where, with the broadleaf maple, it forms a considerable part of the forest growth. The largest trees are sixty to eighty feet high, and from two to four in diameter. In crowded stands the trunks are shapely, and often measure thirty or forty feet to the first limbs; but more commonly the trunk is short.

The boat yards in southwestern Oregon were the first to use California laurel for commercial purposes, but early settlers made a point of procuring it for fuel when they could. The oil in the wood causes it to burn with a cheerful blaze, and campers in the mountains consider themselves fortunate when they find a supply for the evening bonfire.

Shipbuilders have drawn upon this wood for fifty years for ma-

LEAF AND FRUIT OF CALIFORNIA LAUREL

terial. It is made into pilot wheels, interior finish, cleats, cross-ties, and sometimes deck planking. Furniture makers long ago made a specialty of the wood for their San Francisco trade. For thirty years travelers admired the superb furniture of the Palace hotel in that city, and wondered of what wood it was made. It was the California laurel. The hotel's furniture was hand-made, or largely so, at a time when wood-working factories were few on the Pacific coast. The furniture was finally destroyed in the San Francisco earthquake. Furniture is still one of the products made of the wood, but the quantity is small. Other products are interior finish; fixtures for banks, stores and offices; musical instru-

ments, including organs; mathematical instruments, and carpenters' tools, including rulers, straight-edges, spirit levels, bench screws and clamps, and handles of many kinds.

Makers of novelties and small turnery find it serviceable for paper knives, pin trays, matchsafes, brush backs, and many articles of like kind. One of the largest uses for it is as walking beams for pumping oilwells in central and southern California. The beauty of grain has nothing to do with this use.

Country blacksmiths repair wagons and agricultural implements with this wood. Farmers have long employed it about their premises for posts, gates, floors, and building material. Cooks flavor soup with the leaves, and poultrymen make henroosts of poles, believing that the wood's odor will keep insects away. This is probably the old sassafras superstition carried west by early California settlers.

Allowing for Center Rot in Logs

In scaling logs there are a great many different ways of allowing for uniform center or circular rot. For example:

1. Subtract from the actual diameter the diameter of the rotten core and assume the remainder to be the true diameter for scaling.

2. Subtract from the full scale of the log the scale for the rotten core and assume the remainder to be the true scale.

3. Add 3 inches to the diameter of the defect, square the sum and deduct the result from the full scale of the log.

4. "For uniform defect or 3 inches or less in diameter deduct 10 feet b. m. in logs up to 16 feet in length. For defect 4 to 6 inches in diameter add 3 inches to actual diameter of rot, and deduct from full scale of the log an amount equal to the contents of a log of resultant diameter. For defect 7 to 12 inches in diameter add 4 inches to diameter of rot and deduct an amount equal to the contents of a log of the resultant diameter from full scale of log." (Forest Service's method.)

5. Another method is to note the length of log and the longest diameter of the defect, and determine the loss from a cull table. The defect is measured at the large end if it runs through the log or appears only at the large end; otherwise, at the small end. A table of this kind was prepared by H. D. Tiemann for all center defects in logs such as holes, cup-shake, and rot, which are 4 inches or more from the bark, and is as follows:

CULL TABLE
Loss in board feet from holes near the center of logs.

Diam. of hole, Inches.	Length of log in feet—							
	10	12	14	16	18	20	22	24
2	5	6	7	8	9	10	11	12
3	9	11	13	15	17	18	20	21
4	14	17	20	23	26	28	31	33
5	20	24	28	32	36	40	44	48
6	28	33	39	44	50	55	60	65
7	36	43	50	57	65	72	78	85
8	45	54	63	72	81	90	99	108
9	56	67	78	89	100	112	122	133
10	67	81	93	107	120	133	148	161
11	80	96	112	128	144	160	176	192

12	94	113	132	151	170	188	207	225
13	109	131	153	175	197	218	240	261
14	124	150	175	200	225	250	275	300
15	142	171	218	226	255	283	313	341

The wide variation in the results of these different methods can best be shown by taking a specified case. For example, assume a 12-foot log, 20 inches in diameter with a rotten core 6 inches in diameter. The allowances according to the several methods, using the Champlain rule which is one of the most accurate, are as follows:

No.	Loss in board feet.	Per cent of total.
1	122	52.8
2	17	7.3
3	81	35.
4	42	18.1
5	33	14.2

There is abundant evidence that the use of a carefully constructed cull table such as given above is much more nearly accurate than any rule-of-thumb method. In the use of such a table it must be remembered that it makes an appreciable difference in the amount of loss actually sustained whether the defect is a hole or a rotten core. In sawing a hollow log the cavity must be left completely boxed-in to hold against the carriage dogs and prevent the saw breaking into the hole. In the other case the rotten core prevents the shell from collapsing so that it is possible to saw closer to the defect, thereby reducing the loss.—S. J. R.

Elm in New Role

The white or gray elm of Michigan is constantly enlarging its usefulness. One of the latest reported uses for it is in the manufacture of cigar boxes. It is stained red in imitation of cedar and is sometimes marketed as Michigan cedar. The wood, of course, lacks the characteristic cedar odor, unless it is imparted artificially. The facility with which this elm receives stains makes it acceptable for many purposes where it is not used in its natural state.

Sap's Relation to Properties of Wood

It is quite universally accepted that the best time to cut hardwoods is in the winter. Wood so cut is believed to season better, to be more durable, and in every way more desirable where exacting service is demanded. Scientific investigations have demonstrated that there are at least partial grounds for such claims. It is when explanation is made that science and popular belief are no longer in harmony.

The popular notion is that during the winter the sap of a hardwood tree is down—probably in the roots. On this account the trunk and branches of a tree contain considerably less moisture in winter than spring and summer. Accordingly, wood cut “when the sap is down” will be comparatively dry to start with, and having reached this condition in the living tree much of the damage of seasoning in open air is avoided. Moreover, according to this theory, since it is fermentation of the sap which causes wood to rot, of course the best time to cut timber is when there is the least sap; that is, when the “sap is down.”

The trouble with these plausible theories is that they are based on false premises. In the first place there is more sap in a living tree in winter than in summer, and secondly, decay is not due to sap fermentation, but to the action of living organisms of which fungi are by far the most important.

It is easy to understand how the erroneous idea of the movement of sap was gained. In the early spring some trees, like the maple, bleed very freely when cut or tapped. Later, when the foliage is young, there is a mucilaginous layer just under the bark, and it is so soft and slippery that bark can be peeled off very readily at that season. This fact is taken advantage of in peeling logs, posts, poles and harvesting tanbark. The time to make a pawpaw whistle is, as everyone knows, “when the sap is up.” If the sap goes up in the spring, as seems quite evident, what is more natural than that it should go down in the fall and stay down all winter?

To understand the movement of sap, it is first necessary to know what sap is and where it comes from. Tree sap is water containing various substances in solution. The water is absorbed from the soil by the roots and makes its way upward through the sapwood of the tree to the leaves. It contains small quantities of mineral salts and in some species, as birch, maple and walnut, it also contains at certain times a small percentage of sugar and other organic matter. No satisfactory explanation can be made as to the real cause or causes of the rise of sap. The fact remains that water with small amounts of mineral salts in solution is taken in by the roots and passes upward through the vessels in the sapwood of hardwoods (through the tracheids of conifers) to the leaves, where most of it is breathed (transpired) out into the air. The mineral salts are left behind in the wood and leaves, and make up the ash when the material is burned.

But trees cannot live by water and mineral salts alone. Such materials are in no wise fitted to enter directly into the process of cell formation. Every plant needs starch. The machinery for making it is supplied by the green chlorophyll of the leaves, the energy by direct sunlight, and the raw materials are carbon dioxide from the air and hydrogen from the water the roots absorbed. In taking the hydrogen from the water (which is a compound of hydrogen and oxygen), oxygen is liberated. If one examines plants in an aquarium on a bright day it will be noticed that they are giving off little bubbles. These are of oxygen and serve to keep the water in condition for fish which breathe out carbon dioxide the plant needs, and inhale the oxygen the plant gives off. At night plants cannot make starch, since the power (sunlight) is shut off.

During the day each little grain of chlorophyll has been busy piling up starch all about it. During the night this material is converted into sugar which is soluble and carried away to the growing parts of the plant that need it. This is why plants grow more on warm nights than on warm days. The day is largely devoted to making food, the night to making tissue out of the food.

From the above, two things are evident. First, that there must be a continual movement of sap down as well as up, and second, that the sap containing the manufactured food is quite different in its consistency from that taken in by the roots. The two streams flow in different channels. That containing the elaborated food moves through the inner bark instead of through the wood. It is principally a downward flow, but may be in any direction as the demands of the different parts of the plant require.

Since the living wood cells need food the same as the other parts, some arrangement must be made for transferring the food sap from the bark. This is accomplished by means of the medullary rays which extend from the wood into the bark. These rays do more than transfer food; they store some of it over winter to be used in the spring before the leaves are out. This stored food is not in the soluble form of sugar, but in the insoluble form of starch. When there is need for supplies from these storehouses the starch is again converted into sugar which is dissolved in the sap of the sapwood. It is for this reason that the sap of the maple is so sweet in the early spring before the leaves open but not at other times.

From the foregoing it is evident that, so long as the leaves on a tree are active there must be a continuous movement of sap—quite rapidly upward through the wood and more slowly downward and otherwise through the inner bark and the rays. In the summer a tree is normally at its greatest activity, the absorption of water is most rapid and the giving off (or transpiration, as it is called) from the leaves is in proportion. A greater volume of water passes through the tree at this season, but less stays there. The greater the leaf surface exposed the greater the amount of water transpired. A thrifty maple fifteen inches in diameter and fifty feet high has been found to have a third of an acre of leaf surface. If the supply of moisture in the soil gets too low to supply the leaves they wilt. In some species the water content of a tree can be materially reduced by girdling or by allowing the leaves to dry on the peeled trees.

During the winter practically no transpiration occurs in deciduous trees, for there are no leaves. The roots, however, do not cease their activity, but continue to grow slowly and absorb water even in decidedly cold weather. With no chance to escape through the leaves, this water or sap accumulates so that, instead of there being less in a tree during winter than summer, there is appreciably more. The water content of trees is greatest in the spring just before the opening of the leaves. This is more noticeable in sapwood, of course, than in heartwood, as the latter is dead and no longer active in the transfer of sap. It does, however, respond in some degree to changes in the water content of sapwood.

Experiments made by the Vermont Agricultural Experiment Station showed the water content of sugar maples in summer to be between 26 and 27 per cent; in December it was 31.5 per cent; by the middle of March it was 36.5 per cent. The results of numerous experiments by the United States Forest Service indicate the same thing. For instance, the average weight of lodgepole pine ties of the same size cut at Bozeman, Mont., in June, 1902, was 157 pounds; in July, 144 pounds; in August, 150 pounds; in September, 157 pounds; in October, 164 pounds. Winter-cut chestnut poles cut at Dover, N. J., weighed more per cubic foot when green than other seasons' cuts. At Pisgah, N. C., 600 chestnut poles were weighed and the winter-cut was found to be considerably heavier than that cut at any other season, and, except in a single case, at no time did it reach the dryness of the other cuts.

Dr. Robert Hartig, a German investigator, made a careful study of thirty different species of trees practically all of the same age (sixteen years), which he grouped into three classes. He found, by eliminating as far as possible all variables other than the one under investigation, that the percentage of moisture contained in green wood varied materially with the season, as is shown in the following table:

	Jan.	Feb.	Mar.	Apr.	May.	June.	July.	Sept.	Nov.
	%	%	%	%	%	%	%	%	%
Heavy hardwoods	41	38	36	36	39	35	39	38	34
Light hardwoods	53	58	51	49	47	47	50	47	45
Coniferous woods	60	58	59	54	60	60	60	58	58
Average of all	51	51	49	49	49	49	50	48	48

The reason bark peels so much easier in the spring is not that the "sap is up," but that the cambium layer is particularly active in the formation of new wood and new bark. Growth is rapid and the cells newly-formed have delicate, unthickened walls readily torn upon the slightest pressure. Later, growth slows down and thick-walled latewood is formed. Finally there is no growth at all during the resting period (winter) and the bark is tight.

What, then, are the advantages of winter felling of hardwood timber? If only the amount of moisture in the wood were considered, summer would appear the best cutting season. As a matter of fact the user of hardwood is little concerned with the actual or comparative amount of moisture in a tree when it is felled, and this in spite of his insistence that material must be cut in winter "when the sap is down." It is not the water in wood that causes trouble; it is getting it out. Winter-cut hardwood is preferred, not because of the moisture content at the time of felling, but largely because of the effect of the time of year on seasoning.

Seasoning is essentially drying. Dry wood differs from green wood in other ways than the mere loss of moisture. When wood dries the cell walls become thinner—they shrink—but a dry cell is practically as long as it was before. The structure of wood, especially that of the hardwoods, is so complex that when the elements composing it begin to shrink in different amounts and directions, severe strains occur. Wood is somewhat plastic—otherwise it would break into minute fragments upon drying. This plasticity will permit slow readjustments to the new sizes and shapes of the cells, but at best there will be some checking and warping, and this will be increased as the rate of drying or the irregularity of it increases. Coniferous woods are much simpler in structure than hardwoods and can be seasoned more rapidly without serious checking.

Loss of water from wood is wholly by evaporation from the surface. This is very largely influenced by the temperature, so that wood dries much more rapidly in summer than in winter. If seasoning proceeds too fast, checking and warping increase in geometric ratio. Hence hardwoods felled in winter season more slowly and uniformly than when cut at other seasons and for this reason the material will contain fewer checks, which, no matter how small, are a source of weakness.

But how is increased durability of winter-felled timber accounted for? There are several different problems involved. Insects and fungi, which occasion nearly all the damage to timber, are not active during cold weather. Consequently winter-cut material will have more or less time for seasoning (depending upon the time of cutting) before being subjected to infection. If the drying has proceeded far enough it may escape entirely. At any rate the chances of the material getting to the mill in a sound condition will be much greater.

When trees have completed the season's growth the layer of wood next the bark is denser and harder than would be the case if cut while in a growing condition. In the case of poles and round posts, this denser layer does not afford fungi as good a chance to lodge and grow as the undeveloped wood of the cambium layer.

The usual explanation of greater durability of winter-felled material is as follows: "The reason is found in the scantiness of easily decomposed chemical substances in the tissues of trees after the close of the vegetative period. The sap in the tree during winter consists almost entirely of water, and therefore does not offer a favorable medium for the development of micro-organisms. In summer, on the contrary, the sap contains albuminous and other chemically unstable substances which, under the influence of the high temperature of summer, readily ferment and favor the development of decay-producing micro-organisms." (Zon, R.: *Methods of determining the time of year when timber was cut. Forestry Quarterly, Vol. VII. 1909.*)

Assuming this statement to be correct, it could only apply to the sapwood. The sap in heartwood remains practically the same the

year round, for the cells are dead, have no need of food for themselves and have lost the power of storing it up or handling it any way. Since the sapwood of no native species is naturally durable when exposed to conditions favorable for decay, the prolongation of life due to winter-felling would, at least, be slight.

If there were the differences in the composition of the sap that is claimed, then it should be possible by means of chemical analysis of a piece of wood to determine at what season it was felled. The most painstaking investigations of the question by competent German authorities have scored as many misses as hits. As a matter of fact, during the resting period of the tree there is more reserve food in the living wood than at any other time. The sap contains less in solution in early winter, but fungi should not, on that account, experience any difficulty in reaching the stored food. Again, many of the most destructive fungi live, not upon the sap or the cell contents, but on the cell walls the wood substance itself. They will attack the sapwood of any tree regardless of the time of felling. That heartwood of any tree is always more durable than the sapwood is due to the presence in it of infiltrated substances, such as gums, resins, oils, pigments and tannins, which were not present in such quantities in the sapwood.

Another explanation of the alleged increased durability is as follows: "During the growing season the wood of trees contains sulphuric acid and potassium, both of which are solvents of carbohydrates, starch, resins and gums; they are known to soften also the ligneous tissue to a considerable degree. During the summer months the wood of living trees contains eight times as much sulphuric acid and five times as much potassium as it does during the winter months. The presence of these two chemical substances during the growing season constitutes the chief factor in dissolving the natural preservatives within the wood and in preparing the wood for the different kinds of wood-destroying fungi."

Even if this explanation is correct, which is more than doubtful, it could apply only to the relative durability of sapwood, which no one expects to last when exposed to conditions favorable for decay. And, after all, what creditable evidence is there that the season of felling alone affects appreciably the durability of wood?—S. J. R.

TIMBER RESOURCES OF CANADA

It is commonly stated that Canada is a woodland country, and this, as generally understood, means a timber country. Even the statement that Canada is a woodland country needs modification, according to Dr. B. E. Fernow, for at least one-third is treeless tundra, to which must be added the 200,000 square miles of prairie and plains country, the extensive areas above timber line, and a large proportion, perhaps one-half, of the northern woodland country, which is in swamps and muskegs or otherwise open. One should bear in mind, too, the unusually large areas of water surface represented in the innumerable lakes which stand the vast undulating interior plain.

A closer inspection of natural forest conditions of Canada reveals, first, that the country as a whole is poorly timbered; secondly, that the valuable timber is unevenly distributed; thirdly, that comparatively few species are represented in the forest; further, that within the forest areas farmlands are scanty and mostly poor, and wastelands—rock barrens, swamps, bogs and muskegs—plentiful. The country is vast, covering over three and a half million square miles, larger than the United States, and while there are endless woods, really good timber is limited, say 600,000,000,000 feet.

Of this amount of timber, half may be accredited to the Pacific and half to the Atlantic side. In addition, a large amount in the aggregate of pulpwood and of inferior saw material, useful for local development, is found scattered through the middle portion.

While an enumeration of species occurring in Canada would show a rather large total of 150, less than one-third are of commercial value, and, indeed, if frequency and quantity of occurrence are kept in mind as factors in determining economic importance, the number of important species will be found within thirty, namely, eighteen softwoods and twelve hardwoods.

Conditions Abroad During 1912

Reports are at hand from leading hardwood merchants operating in foreign countries, representing the sentiment as it applies to the year's business of 1912 in foreign countries. In speaking of the mahogany import during the year a Liverpool house states the amount brought in during that period was 21 per cent more than for 1911, and that the bulk of it, or specifically 88 per cent, came from the west coast of Africa. The average quality and size was similar to former imports, and throughout the year the various descriptions sold readily at high and advanced prices. The American demand absorbed a considerable portion of the African mahogany and most of the richly figured logs of veneer quality. Mexican stock maintained a firm condition throughout the year, and the moderate import which arrived at regular intervals was quickly turned over. Cuba contributed a considerable supply of mahogany to the Liverpool market during the past year, but the consumption of Cuban stock kept pace with the offerings. Supplies were sold mostly on arrival. The condition in Cuban stock now shows that quantities of Cuban mahogany are light compared with twelve months ago and values are appreciably higher. The same can be said of African stock.

There was but a moderate average import of American walnut logs throughout the year 1912, although figures showed a considerable advance over those of the previous year. The wood was chiefly of medium quality and of various dimensions. While the prices were generally steady, lower rates were in some cases accepted for small logs of common quality. There seemed to be a dearth of large, high-grade walnut logs offered. But the beginning of 1913 shows a light supply on hand with a good inquiry prevailing for high-grade logs of good dimensions. Manufactured American walnut arrived in moderate quantities and was readily disposed of at firm prices, which showed a constantly increasing tendency to become stronger.

In reviewing the timber trade of Glasgow for 1912 it is gratifying to note that on the whole a satisfactory year's trade resulted both as regards the volume of business and general conditions which prevailed. The year opened with an appreciable dullness which resulted from the great unrest which permeated the labor world, and the serious strikes which ensued. As soon as these things were disposed of, however, trade picked up rapidly and gradually assumed active proportions in many directions. Thus on the whole the figures for the year make a very favorable showing as compared with other recent years. The extensive demands for shipbuilding requirements marked the dominant feature of the situation. This industry absorbed large quantities of timber, particularly teak and pitch-pine.

Values without exception pursued an even course and substantial increases were recorded in many instances. These were chiefly noted in connection with woods feeling the rise in ocean freight rates. This factor was abetted by the moderation of imports together with the elimination of stocks on hand. In addition to shipbuilding other lines of wood consuming industries enjoyed marked prosperity, among these being wagon building, cabinet making and box making. House-building on the other hand has not been as active as it was anticipated it would be, and so far has shown little tendency to improve materially. The prospects, however, indicate that the situation within the next few months will appear somewhat brighter, although any improvements will undoubtedly be slow and gradual.

A fairly satisfactory situation prevailed in the oak market, although plain stock was in better request than quartered oak. In the plain oak No. 1 and No. 2 common in inch and 6/4 particularly, showed activity and unusually good prices. The consumption of firsts and seconds was considerably healthier owing to the high prices which finally obtained in those grades. The best movement of quartered oak occurred in firsts and seconds which commanded good prices, although other grades did not meet with any great response. Almost all of the import trade in

wagon planks was of contract shipments, but a few consigned parcels came forth and were disposed of fairly satisfactorily. A steady inquiry was in evidence for northern oak timber of good average diameter, and no difficulty was encountered in disposing of such shipments at normal prices. Southern woods were not inquired for in the Glasgow market, and consignments of this description should seemingly be avoided.

The import of poplar was of but moderate extent, although it was amply sufficient to meet the market's demand. The continued high prices which have prevailed, particularly on prime stock, have had the effect of diverting attention to other cheaper woods such as sap gum and Gaboon mahogany. The year showed a moderate average demand for the best quality of yellow poplar logs, although the inferior timber met with but little inquiry.

Arrivals of walnut lumber at the Glasgow market were trifling during the year, but were sufficient to meet the demand. But limited arrivals of walnut logs were noted and for the most part they were small and of inferior quality.

The Glasgow market for ash lumber improved somewhat during the year, and fair sales were noted, chiefly in No. 1 common in 1/2, 5/8 and 1 inch stock. Firsts and seconds in the same dimensions also sold well, but not in as large quantities as No. 1 common stock.

There is no stock of hickory logs on hand at the Glasgow market and buyers are experiencing some difficulty in filling their requirements. The supply of hickory has been moderate all through the year and prices have depreciated sharply during the closing months.

An increased demand has been noted for sap gum, and a good business has been transacted in both planed and unplaned lumber at generally firmer prices. The reduced consumption of red gum has followed an increased scale of prices. In some instances sap gum has been substituted. The year 1912 showed only a moderate business in red gum lumber.

Prime dressed boards of cottonwood, 3/8 inch thick and 18 and up, and 21 and up wide, have been the only active grades in this wood.

The market at Hamburg, Germany, has maintained a healthy call for white oak. The imports of this stock, however, have not been much larger than during the year 1911, owing to the gradual rise in prices, and the difficulty of obtaining satisfactory shipping facilities.

A steady request was maintained for black walnut throughout the year and a rising scale of prices has been maintained from month to month. The better grades particularly enjoyed increasing values. As a result in many instances consumers who have heretofore bought the best grades of stock were compelled to take the lower grades during the past year. Owing to the scarcity of lumber shipments during the shipping season for active consignments, which were rather large during the latter part of the summer, stocks have been entirely consumed and at the close of the year stocks were found to be relatively light.

The Hamburg trade in mahogany was confined principally to a small quantity of high-grade Honduras and Tabasco stock. Prices which prevailed were so high that they prevented business on a larger scale.

Inasmuch as the Hamburg market buys its yellow poplar mainly in logs, but a small business was done in this wood during 1912. In cottonwood also the business was not what it might have been if shippers were not compelled by excessive freight rates to ask constantly rising prices. The imports therefore did not exceed those of previous years.

A limited demand for red gum was filled by consignment, which arrived occasionally during the year. Sap gum has been in good request, however, during the twelve months, an even level of prices on this line of stock being responsible for the steady inquiry.

The business in chestnut was rather limited and was done wholly on forward delivery prices, the demand being chiefly concentrated on the best grade of chestnut lumber.

Annual of Indiana Association

The Indiana Hardwood Lumbermen's Association met in its fourteenth annual convention at the Hotel Denison, Indianapolis, on January 16. There was an attendance of approximately one hundred. President Van B. Perrine, in opening the meeting with his address, stated that the Indiana association is really the father of all hardwood organizations and that its membership is closely interlocked with the membership of various other associations in the hardwood field. The purpose of the Indiana association, therefore, is not so much to work out the practical problems of the trade but to afford a means of getting together of the Indiana lumbermen once a year for social intercourse.

President Perrine referred to the pending reports of the various committees and then, speaking of inspection, said that present rules are quite satisfactory to the Indiana association; in fact it made little difference what rules were in force so long as they are uniform. He said further, however, that in order to get this uniformity, it would be necessary for Indiana lumbermen to use all their influence. He deplored the fact that there is a continued difference between the two associations on the inspection question and said that unification of existing inspection rules would not only mean greater success for all, but confidence all over the world where products of the members of the various hardwood associations of the United States are marketed.

Secretary C. H. Kramer compared present conditions with those existing a year ago. He stated that if it had not been for excessive rates in the early part of the year and the car shortage which has resulted in such hardship more lately, the cut and shipments during 1912 would undoubtedly have been the greatest in the history of the state. He said further that there was an excess of shipments over cut for 1912 of approximately five per cent and that this increase had resulted in a considerable advance in price. This advance, however, was also influenced to a degree by increased cost of stumpage and increased labor expense. The secretary, because of these facts, advised members of the association to employ every means whereby they would secure highest quality of production and at the same time operate on as low a cost basis as possible. He suggested that with present demand and shortage of lumber, increased activity in sawing will result, but advised against this necessity for restocking immediately having the effect of making members disregard quality of production. The secretary said that No. 2, 3, and 4 common stock has shown the greatest activity and the greatest advance in price. He also said that consumers are month by month showing greater willingness to take up odd length stock. Fourteen new members were approved by the board of manufacturers during the year and their names were presented to the association for ratification.

Speaking of car shortage, Secretary Kramer said that, while there is some noticeable improvement in the situation, there is, however, unnecessary time wasted on the part of the carriers in many cases in moving their cars from loading to receiving points. He said that this condition means the loss of considerable money in interest to the shippers and that a fair and sure way of remedying these conditions would be a reciprocal demurrage rule.

Mr. Kramer then referred to members of the association who have been signally honored during the past year,—namely, C. H. Barnaby of Greencastle, who last June was made president of the National Hardwood Lumber Association, and John M. Pritchard, who recently was elected president of the Memphis

VAN B. PERRINE, FORT WAYNE, IND., RE-ELECTED PRESIDENT OF THE INDIANA HARDWOOD LUMBERMEN'S ASSOCIATION.

Lumbermen's Club.

Treasurer James Buckley, in submitting his report, said that there was a balance on hand from last year of \$7.08; the receipts for the year were \$585.65; disbursements, \$97.50; leaving a balance on hand of \$495.23.

Chairman W. W. Knight of the trade conditions committee spoke very optimistically of the business conditions which have prevailed during the last six months. He said that material reduction in hardwood stocks has been effected and that the market is undoubtedly in the seller's control. He predicted excellent business conditions for the next six months, with maintenance or slight increase in present values and continued demand for all kinds of lumber.

C. H. Barnaby, E. A. Swain and J. H. Stimson were appointed as a nominating committee to recommend officers for the coming year.

The inspection committee, through its chairman, J. M. Pritchard, reported that the bulk of its work has been with a view of endeavoring to secure uniformity of hardwood grades. Mr. Pritchard told of the

work of the rules committee of the National Hardwood Lumber Association and said that the members of that body would soon receive recommendations covering proposed changes in hardwood rules.

Discussion of railroad matters occupied the attention of the meeting during the afternoon. The members were addressed by E. M. Elliott, agent for the Union Line System of Indianapolis, who asked for closer interest between shippers and carriers.

"Interdependent Relationship of the Shippers and the Railroad in Service with Direct Relation to Demurrage Rules and Regulations" was the subject of a talk by W. M. Prall of Pittsburgh, superintendent of car service. The work of the Railway Commission of Indiana was reviewed by Judge Woods of Indianapolis, particularly regarding railroad regulations.

Chandler Coulter of the School of Science of Purdue University spoke on the subject of forestry and emphasized particularly conditions obtaining at hardwood operations. He pointed out what to the members were startling conditions regarding waste in converting the hardwood stumpage into lumber. He also reviewed the work of conserving the forest resources in Germany and France.

President Perrine asked for nominations to secure a member for the Indiana forestry board. J. V. Stimson, chairman of the committee on forestry, nominated W. A. Guthrie of Indianapolis, who was unanimously elected. The Hugh McLean Lumber Company of Buffalo was elected an honorary member of the association.

The nominating committee then reported, recommending the following officers for the coming year:

- President: Van B. Perrine, Fort Wayne.
- Vice-president: Bedna Young, Evansville.
- Secretary: C. H. Kramer, Richmond.
- Treasurer: James Buckley, Brookville.
- Directors: Charles H. Barnaby, Greencastle; George Palmer, Sheridan; W. A. Guthrie, Indianapolis; J. V. Stimson, Huntingburg; Samuel Burkholder, Crawfordsville; Claude Maley, Evansville; A. J. Jacoby, Hamilton; Frank Sheppard, Indianapolis; Frank Galbraith, Sunman; Haynes Egbert, Goshen; W. W. Knight, Indianapolis; E. A. Swain, Shelbyville; Walter Crim, Salem; George Waters, New Palestine; Frank Reynolds, Rushville.

The ticket was unanimously elected, after which the convention adjourned.

In the evening, the usual banquet was held in the dining room of the Hotel Denison. It was well gotten up and fully attended.

PIPE ORGAN AND TRIM IN PRIVATE MUSIC ROOM OF A NEW KENTUCKY HOME

Hardwood for Interior Decoration

Here are some pictures from a new Kentucky home that are offered as an adornment to this tale, and to illustrate an idea, which should be of value to the hardwood trade in exact proportion to the extent to which it arouses interest and action.

The idea is that there is a splendid boosting opportunity before the trade for pushing hardwood to more extensive use in interior decoration, as well as for trim and the generally accepted (or limited) run of millwork. And along with the idea it is desired to predicate the following propositions:

- 1.—That the best way to boost is to create more business instead of trying to get more of the other fellow's trade.
- 2.—That the people are spending a million dollars a day now for imported luxuries, a part of which might better be spent in building more luxuriant homes.
- 3.—That there is room for wonderful development in the use of hardwood for interior decoration as well as trim.
- 4.—That a good way to help bring about a greater use of hardwood for interior decoration is through exploiting examples of the attractive use of it in interior woodwork.
- 5.—That it is desire and not necessity that is mother to the biggest trade.

A recent press bulletin from the Bureau of Statistics at Washington tells us that the people of this country are now importing articles classed as luxuries at the rate of a million dollars' worth a day. This may not appear at first glance to have any connection with the use of hardwood for interior decoration. But just the same it has bearing in more than one place on the idea it is desired to advocate here of the hardwood trade making concerted effort to get more of its product used for finishing the interior of homes and public buildings.

It shows in the first place that the people of this country indulge in many luxuries. That being true, and being a habit that is

growing right along, what better idea is there than to direct this habit toward more worthy things—toward the building of bigger, better and more luxuriant homes? That is but one place it has bearing, though, and another is in this: The average home, as well as the furniture that goes into it, is in a way an example of luxury, of catering to desire, not resulting from necessity. True, every man must have some kind of a home, and some furniture, but those that necessity alone would call for would be considered very meager indeed. The average man builds a better home or buys better furniture because he has come to desire it, and it is therefore luxury and not necessity. So, it being evident from this that it is desire which begets the best part of the trade, it logically follows that the way to get a bigger trade is to create more desire.

The common way of making people want things in the mercantile world today is to exploit before their eyes in some form or other those things calculated to appeal. Therefore the hardwood trade should be able to arouse more interest and desire by displaying attractive examples of interior decoration made with wood used in various forms, for, just as the printing of attractive pictures of houses and detailing the plans of same has helped encourage building and enlarge the volume of sales in structural lumber, so should the showing of attractive interior woodwork enlarge calls for more.

And here's another bearing of this luxury matter: While this article was in course of preparation, there came to hand an issue of the Saturday Evening Post in which a writer on the subject of antiques tells of wealthy Americans going abroad and not only paying fabulous sums for the antique in furniture, but actually taking the woodwork out of the interior of old English homes, bringing it here and installing it as a fit setting for the furniture at a cost of from seven to ten thousand dollars per room for this old woodwork alone. That is what makes up part of those imports that are classed as luxuries.

A CORNER IN THE MUSIC ROOM, SHOWING ELABORATE DETAILS IN WOODWORK

VESTIBULE TO MUSIC ROOM IN QUARTER-SAWED OAK

A lot of that kind of thing may be classed as a freaky fad, but it serves as a reminder that good hardwood is the thing that makes the best kind of interior decoration, and it also suggests that the people are ripe for some innovations in the way of inside finish. Nobody really admires a plastered wall, and the wonder is that we have not long since extended fine woodwork beyond the mere trimming of openings. There was the old ceiling, of course, and there is a lot of it yet, but that, like the plaster, is a thing of convenience and necessity, and not a matter of desire and luxury. What we need now is to develop the artistic in interior finish, and the thing to do it with is good woodwork.

There are many fine examples of woodwork in the form of interior trim in the country now, and the habit of using hardwood in this way is growing. The idea is to use the examples which do appeal to boost the game and thus increase the volume of call for hardwood for this work. The examples illustrated herewith are taken from the new home of G. W. Berry of Frankfort, Ky. They are

from only one room, the music room. Here we have an indulgence in a form of luxury that appeals so strongly that it should inspire more effort along the same line by others. There is not only a lot of fine paneling in quartered oak, but there is a wealth of detail in shaped and carved woodwork that makes one envious of the owner of all this. The illustrations need no elaboration in the way of explanation—they speak for themselves as an inspiring example of modern luxurious home building.

One can find here and there, and almost everywhere, other examples of attractive interior decoration with wood, some very rich and costly, others less expensive, but all infinitely more attractive than any other form of interior finish. Why not get busy, collect a lot of these, and by exploiting them help create a more general public desire for real inside woodwork, and through this means make good the proposition that the best way to boost is to create more business instead of trying to get some of the other fellows' trade?

J. C. T.

New Process for Making Sugar

Editor's Note

In eventual wood utilization it may be a far cry to discuss the commercial process by means of which a substantial food product for live stock may be secured from sawdust and wood waste. However, apparently it is within the possibilities of the future. The article herewith appended on this subject is by Dr. Leonard Keene Hirschberg, A.D., M.A., M.D., of Johns Hopkins University. From the source from which it emanates, it should be authoritative and worthy of consideration.

Chemists are complaining bitterly of the effect upon their research work which the lack of substantial support is having as compared with the enterprise in this direction shown in Germany, where it is announced that \$5,000,000 is being placed at the disposition of chemists for experiments in connection with synthetic rubber, which will doubtless ultimately prove of vast benefit to the German nation.

The British chemists, however, find some consolation in the fact that experiments in England have resulted in a discovery which, it is said, may revolutionize the sugar refining industry.

By a new chemical process the manufacture of sugar from wood and sawdust has become an accomplished fact. Large quantities of

the commodity have actually been produced, and it is said that arrangements are in hand for the establishment of factories throughout England for the exploitation of the process.

"Sacehulose" is the term applied to the new product. The results obtained are what are called "classed process," in which sawdust is subjected in closed retorts to digestion with a weak sulphurous acid solution, and under the pressure of about ninety to one hundred pounds to the square inch effective transmutation takes place. Of the resulting product twenty-five per cent is sugar. The constituent sugar so formed is dextro in part and fermentable to an extent of eighty per cent. The rest is not fermentable.

Numerous experiments and demonstrations were recently made

by the well-known scientist here A. Zimmerman. Here are some of the experiments:

"Four draught horses were selected doing ordinary work with others, and, in the hot time of the year, when horses are generally expected to lose weight, the usual food ration was altered by deducting four pounds of oats a day from the food selected for the four and replacing them by four pounds of a 'sacchulose' molasses compound. The animals working in the same teams with the selected four, to which had not been given this food, showed no increase in weight, but those experimented upon showed a net gain in body weight, and worked better in every way. Increases in weight of seventy pounds, thirty pounds, thirty-five pounds and sixty-five pounds were shown respectively.

"A colt that was in such a weak condition that it could hardly stand was next experimented with. Four important veterinary surgeons obtained, after a careful examination, had given independent verdicts that the colt should be destroyed. Then the new food was given to the animal, first one and one-half pounds daily divided into three meals. This was increased to three and one-half and four pounds daily, the quantity of oats being slowly decreased in the same proportion. Two pounds of chaff also was given daily and hay unlimited.

"The weight of the animal taken at the beginning of the six months' feeding, was 623 pounds; the final weight, after that period, was 882 pounds, a total increase of more than 250. The colt is now in excellent condition and fit for any work.

"The secretary of an important Durham colliery reports that he finds that the substitution of two pounds of 'sacchulose,' mixed with molasses for an equal weight in oats, keeps the pit ponies and horses in a good, hard condition, similar to that when fed entirely on oats and chaff.

"In the production of milk and butter a keen exhibitor of dairy produce, after several years' failure to gain any first-class recognition at county shows, achieved successes during a period in which he experimented with 'sacchulose' mixed with oil protein.

"The manager of one of the largest firms of butchers has made the interesting discovery that the new food produced the best bacon and hams. A veterinary surgeon, after conducting experiments on his own horses, came to the conclusion that 'sacchulose' mixed with molasses was the best sugar food he ever tried, and its flesh-forming propensities were most pronounced.

"There are many possibilities apart from 'sacchulose' as a feeding stuff, for the utilization of this converted wood substance, and its value in these directions has yet to be considered. Its sugar content marks it out as a resource for some industries, and naturally the first of these is the manufacture of spirit. A factory capable of treating 200 tons of sawdust weekly could turn out between 300,000 to 400,000 gallons of proof spirit a year. This would also give by-products of 50 tons acetic acid, 10 tons furfural, and 2,000 gallons of methyl alcohol for recovery. The spirits produced are of high quality and free from fusel oil. It is thought that this, in these days, is of mixed advantage, since it appears that fusel oil obtained as a by-product is becoming more valuable than the spirits produced.

"This converted wood is said to be the cheapest base from which to start for the purpose of making synthetic rubber, whose source is starch or sugar. Converted wood will doubtless be of great assistance in the development of this process. The base of its derivatives may be used in the linoleum industry, for this specially treated and prepared base has many advantages for resilient treadings.

"Again, in the manufacture of mining explosives, while the organic matter is mixed with powerful oxidizing agents, this substance can be used with great advantage, since it can be minutely divided and has such rapidity of combustion.

"Not the least surprising of its characteristics are its non-conducting properties produced by appropriate treatment; so that for refrigerator packing, incubators, ice chambers, it will be found of great use.

"Much more could be claimed for it. Many outlets are under

investigation and undergoing patient developments. These varied processes are after all the result of, and go hand in hand with, the production of sugar from wood."

Mr. Zimmerman's experiments have raised considerable interest and comment in this country. Another scientist, Walter F. Reid, F. C. H., who is also interested in the new discovery, says that there is an enormous amount of wood still left in the world, especially in Europe, and it is a rather curious development that the United States, which had such enormous reserves of forests, is now going to outside countries for wood. On the other hand the total area of forest lands, including Siberia, is greater than the whole of the United States and Canada combined.

There are a great many sawmills in London doing a large amount of work, and the sawdust produced is far superior to that collected from the fresh wood in the countries in which the wood is grown. The wood used in London is mostly water-borne, from which the resin has been washed out, and thus gives a far better product.

Qualities of Water-Soaked Wood

While it has long been recognized that soaking wood had some effect upon it, no careful study of the matter has been made in this country. In a general way it is known that prolonged soaking results in leaching out certain substances, thereby making it lighter, somewhat more resistant to decay, easier to season, and reducing the tendency of the manufactured lumber to shrink and swell. In olden times leaching with water was much practiced by joiners. In Japan it is a common custom to store timber in water, and although this is done to protect the wood from rot, it is an interesting fact that Japanese wood manufactures excel in the absence of the unfortunate "working" and checking.

In order to determine just what influence soaking has on timber, a very extensive series of experiments through many years was recently completed at the Austrian experiment station. Wood from eighty-eight trees, representing nine different species, was used, one-half cut in summer, the other in winter. Specimens were tested after treating in four different ways, namely, (1) unsoaked, (2) soaked in standing fresh water, (3) soaked in running fresh water, (4) soaked in salt water. The soaking extended over periods of from one and one-half to three and three-quarter years.

One general conclusion reached was that soaking the wood in fresh water, such as occurs in the process of rafting logs, or from lying in mill ponds, or where wood becomes frequently wet from showers, and in similar ways, exerts a favorable influence on the wood by decreasing the hygroscopicity and thereby decreasing the shrinking and swelling. The danger of checking is lessened as well. A favorable influence also is probably exerted on the durability of the wood, though this could only be assumed. It would require several years more to demonstrate the accuracy of this conclusion. Another result was the apparent loss of strength to a small degree.

Soaking in salt water appeared to lessen the shrinkage as compared to that of unsoaked wood. Owing, however, to the absorption of salt, which has a strong affinity for moisture, the hygroscopicity is increased, thereby causing a greater degree of swelling and warping when the wood is exposed to variable humidities. The checking was lessened by the treatment, and the compression strength is also less than that of wood in the air-dry condition. Whatever influence time of felling may have had on the properties of the wood could not be detected.

As a result of chemical analyses of the test specimens it was found that treatment with fresh water produced an infiltration of lime and magnesia, while the storing of chlorides results from the soaking in salt water.

The use of wood soaked in fresh water is recommended by the investigator for artistic and industrial purposes. On the other hand, wood soaked in salt water is recommended for use only where durability is of more importance than freedom from "working" in a changeable humid atmosphere. Such wood should be thoroughly air-dried before being used and should be avoided in fine woodwork, as the salt in the presence of moisture is likely to cause rust streaks upon coming in contact with iron.

Flagstuffs for Railroad Men

One of the humblest uses to which wood is put, and yet highly important as to safeguarding human life, though perhaps never thought of by the ordinary man, is the little stick fashioned to fit the hand and upon which is attached a piece of bunting of one of the cardinal colors—the railroad signal flagstaff. One of these flagstuffs is rather a small article when considered as an individual product of wood, but when one stops to consider that every locomotive, every train crew, every caboose, every section foreman and every crossing guard has one or more sets, each set containing from three to five different flags, it can readily be understood that a vast number are used.

Like everything else, railroad flagstuffs are bought by the thousands each year by the larger railroad companies. Where they go no one can say with any degree of accuracy, any more than they can explain the disappearance of the billions of stick pins which are manufactured yearly. It is a safe conjecture that few of them are ever actually worn out. Perhaps most of them are unavoidably broken—maybe they are dropped from the hand of a freight brakeman under the wheels of a moving car, or it may be that the same brakeman has found his flagstaff an effective weapon in opening up the scalp of some tramp.

Most any piece of wood can be made into a flagstaff, but the really desirable article must be made of clear, sound, straight, tough and enduring material. Hickory would fully answer this purpose, but this species is by no means abundant and consequently is high in price, so that ash has been found by experience to be an equally desirable wood. Good ash is practically proof against wear as well as against the rain and snow and sun to which these staffs are exposed. There is a standard size for these articles, as there is for everything else that the big railroad corporations use in large quantities. The standard of the flagstaff is 24" long by 1 1/8" in thickness. The length is sufficient to permit of a piece of bunting 12" or more in width to be attached, while the thickness is about right to fit into the grip of a strong hand. In some instances the staffs are ironed or a key screwed on to them to permit their being fastened in a socket on the rear end of a car. One or two of the railroads demand that a slit be sawed on one end of the staff, extending half its entire length, so that the bunting may be inserted in the slit and held tightly in place by screws extending from one half into the other. The addition of irons or brackets or slitting slightly increases the cost. The slit staffs are said to be more economical in the end, however, because the frayed bunting may be removed and a new flag inserted in its place. Thousands of staffs are thrown away by railroad men simply because the flag has become useless itself, and it is as easy to secure a new flag and staff from division headquarters as it is to return the staff itself and order a new flag to be attached.

By no means do all of the railroad companies buy their flagstuffs. Some of them attempt to manufacture a sufficient supply in their own shops at a cost that is very hard to approximate, yet without question is exceedingly high. For instance, one shop superintendent stated he had an old man—a man of all work around the shop—who in his spare time shaved these staffs from odd pieces of wood! Asked as to what wood was used and where the supply was obtained, he replied that most of it was parts of damaged cars that came into the shops for repair. He never had figured out what these staffs cost him, based on the time of the man of all work or on the value of the material used, or whether it was suitable or otherwise. Unquestionably, the superintendent would be saving money for the railroad company if he were to buy staffs from an outside source.

One of the trans-continental lines—it would be telling tales out of school to reveal the corporate title—uses for its flagstuffs broom handles! And these broom handles are not of the first quality at that. In fact, they are rejects and the railroad company pays \$22 a thousand for them. Even these features are not the worst that

can be said, since the broom handles are 36" long and the company does not even saw them off to the proper length before issuing them to the train crews. One can imagine with what respect a flagman observes one of these staffs. It is a safe bet that the president of that railroad company would not relish a lead pencil 18 inches long if it were handed to him to write with.

A special machine has been designed and is in use in several factories in the Middle West for manufacturing flagstuffs at a considerable saving over what it would cost a railroad company to turn them out by hand or a few pieces at a time. The machine in question is a modification of a spoke-turning lathe and has been developed into a highly efficient piece of machinery. In one of the factories the flagstuffs are a minor product in the sense that they are made of material from which larger articles are turned and serve to assist materially in eliminating the waste problem of that particular factory and at the same time bear the full return on the cost of manufacture as well as the proportionate share of overhead expense and return a profit to the manufacturer.

Freight Rates and Hardwood Prices

In discussing the rise in the price of hardwoods in the Central West, the sales manager of a large eastern hardwood manufacturing company recently advanced a unique theory in explanation. He said he had been of the opinion for a long time that the millmen of the Mississippi valley section were selling their lumber too cheaply and that they could get at least \$3 and perhaps \$5 per 1,000 feet more without in the slightest degree risking a competitive invasion of their markets at Chicago, Michigan and adjacent territory. He pointed out that there were two main gateways to Chicago, one of them being Cincinnati, for the lumber from the Appalachian chain, and Cairo, for the stocks produced in the Mississippi valley, including Arkansas and other states. The freight rate from Cincinnati to Chicago was the same as that from Cairo to Chicago, both being 10 cents. A wide difference prevails between the rate to Cincinnati and that to Cairo from points of production, the rate to Cincinnati being 17 cents as against 7 to 9 cents to Cairo. This difference constituted an arbitrary in favor of the Mississippi valley producers, who had by so much the advantage over the eastern producers. The difference amounted to about \$5, but the Mississippi valley millmen had for years been getting no more for their lumber than the eastern producers, although they could have advanced their prices to within 50 cents per 1,000 feet of the eastern arbitrary without at all endangering their markets. At last they seemed to have realized that they were actually giving away from \$3 to \$5 on every 1,000 feet of lumber and to have resolved to get this margin for themselves. Certain large jobbers, foreseeing the possibility or probability of such an advance, had placed orders taking up virtually the entire cut of the Mississippi valley mills for months to come at higher prices, and then advanced their figures. When the furniture manufacturers at Grand Rapids and other consumers were asked to pay the increase they naturally turned to other sources of supply, only to find that the figures they were called upon to give were still slightly below the quotations at which the eastern mills could lay down stocks, and the terms of the jobbers had to be met. Thus it was that lumber advanced in spite of the embargo placed upon exports by way of New Orleans and other southern ports by the burdensome regulations imposed by the railroads upon export stocks. The western advance, of course, has not helped the eastern mills, except perhaps that the Mississippi valley development has tended to make the export movement through eastern ports more active and thus relieved in a way what pressure might have otherwise been exerted upon the hardwood trade here. There is a limited area of hardwood producing territory, notably in the Virginias, that holds a distinct freight advantage to eastern points.

Annual of Chicago Association

The forty-fourth annual meeting of the Lumbermen's Association of Chicago took place at the Hamilton Club on the evening of January 21. The usual diuner was provided preceding the regular meeting. There were about two hundred members present.

President Brown opened the business of the meeting with a report covering the year just closing. He summarized the work of the standing and special committees for 1912. The president's report stated that the meeting was the second annual of the recently formed lumbermen's association composed of seven divisions, although it was the forty-fourth annual of the old Chicago Lumbermen's Association. A seventh division was added last April, at which time the Millmen's Association was taken into membership. This division is known as Division G. Early in the present month the Stair-Builders of Chicago were also admitted to membership, their division being designated as H.

The report showed three deaths during the year,—C. W. Hinkley of the Soper Lumber Company; George Green of the George Green Lumber Company, both from Division A; and Edward Krupka of the Bursik & Krupka Company, Division G.

The president commended the directors and the members of the various committees for their faithful and patient service during the year and for their unselfish devotion to the welfare of the lumber industry of Chicago. A very apparent increased confidence among members and local customers as well as between Chicago lumbermen and distant shippers and consumers of lumber products has resulted from the association work. President Brown put himself very forcibly on record as believing that the local association would never reach its highest plane of usefulness until it could either compel the unscrupulous trader to go out of business or to correct his business methods. According to report, the net gain in membership for the year 1912 has been twenty-two per cent, but there are still many lumbermen and millmen in Chicago who could benefit from membership in the association.

The work of Murdoch McLeod, chairman of the finance committee, was particularly commended in the report. It was through the able efforts of this committee that the National Hardwood Lumber Association in its convention in Chicago last June was entertained with such complete satisfaction to all. The work of Oliver O. Agler, chairman of the entertainment committee, and the committee members was also commended.

President Brown also told of the inauguration of the idea of publishing the Lumbermen's News, the first issue of which was brought out last June at the time of the national convention. The paper has been published monthly by the publicity committee, which has had entire charge of the work. The publicity committee has been asked to consider installing some plan for the exchange of surplus stock, but a satisfactory plan has not been worked out during the past year. There is, however, an increasing demand for it and the report said that there is every probability that it will have early attention.

The trade relations committee, presided over by C. A. Flannigan, was one of the most important committees during the year 1912. One of its most important accomplishments was the extension of the fire limits of the city of Chicago. This question was worked out by the committee in conjunction with committees from the Association of Commerce and from the City Council. The result of its efforts was a considerable extension of the fire limits, which is fair and satisfying to all. This committee also consid-

FREDERICK L. BROWN, CHICAGO, PRESIDENT OF THE LUMBERMEN'S ASSOCIATION OF CHICAGO.

ered the proposed lumber exposition and urged favorable consideration by the board of directors of the association. The board, however, decided that it could go no further at this time than to extend its moral support.

The incorporation of the Lumbermen's Mutual Casualty Company, designed to provide adequate, satisfactory and reasonable liability insurance for lumbermen and woodworkers, was reviewed in the report. The incorporation of this body was the result of the recent employers' liability act that went into effect in Illinois last year. It was found that rates covering liability insurance were increased from two hundred and fifty to five hundred per cent. The new mutual company is the direct result of the efforts of the directors and officers of the Lumbermen's Association of Chicago. It has met with increasing popularity from the outset, as it has been demonstrated that the protection which it guarantees, the economy involved and the character of service extended by the company places it in the foremost rank of liability insurance.

The arbitration committee, headed by Frank J. Heitmann, has had an important work to do during the year. With a committee of this sort, composed of the type of men which form it, there seems to be small excuse for going into excessive expense in employing legal aid to settle controversies which arise naturally in the lumber business. Further recommendation of the employment of the committee's services is the fact that, being lumbermen, they can arrive at much more equitable decisions than could an ordinary court of justice. In the case of a serious disagreement beyond the jurisdiction of the arbitration committee, the committee on appeals has been provided. During the past year this has been headed by M. F. Rittenhouse. No appeals were made to the committee on appeals during the past year.

Mr. Brown's report also referred to the report of the inspection committee, with George J. Pope as chairman, which appears elsewhere in this article.

The traffic committee, with Herman H. Hettler as chairman, had considerable work to do regarding traffic matters bearing directly upon Chicago trade. A summary of the report of this committee is also found elsewhere in this article. The two most important subjects which have come up have been the policy of the association regarding increase of hardwood rates from the Southwest and regarding reconsignment in transit of Pacific coast products.

After referring to the possibilities of great future usefulness on the part of the credit committee, the report spoke of the present association headquarters, the completeness of which it strongly commended. The gradual crystallization of the sentiment in favor of some kind of a club feature resulting in the present Lumbermen's Club for the Chicago trade was outlined. President Brown deplored the occasionally expressed idea that the Lumbermen's Association of Chicago and the Lumbermen's Club of Chicago are propositions working on competitive lines. These two organizations are entirely and absolutely separated, both as to incorporation, membership and purpose. The lumbermen's association is made up entirely of firms and is purely for business purposes, while the lumbermen's club has entirely an individual membership and is of a purely social character.

The president expressed his regret at not being able to submit a complete report on a plan which has commanded considerable of his attention which will eventually involve the erection of the Lumbermen's building in Chicago in which both the association

and the club will be located in close proximity. The hope, however, has been carried so far as to warrant the statement that such a proposition is a possibility in the very near future. The leases on both the association and club quarters run out in a little over two years and it is hoped that before their expiration provision will have been made to finance the erection of such a structure, which will involve no expense whatever on the part of the local trade and will merely require them to agree to take quarters for a term of years in such a building when completed. The importance of the value of this question to the local trade needs no argument. The time and annoyance saved visiting millmen and buyers would mean a vast saving to the local trade and would undoubtedly serve to attract considerable trade to the Chicago market which might otherwise be diverted to other large centers.

Mr. Brown closed his report with an appeal for even greater co-operation among the membership and individual activity on the part of each member and further the president thanked the board and committees for their active and energetic co-operation with him during the past year.

Secretary E. E. Hooper in his annual report gave interesting statistics on lumber receipts in Chicago during 1912. The aggregate according to the best data obtainable was 2,670,696 feet of lumber and 501,651,000 shingles by rail and by lake. Of this 284,596,000 feet of lumber and timber were reported at the custom house as lake receipts. Lake shipments of shingles aggregated 1,660,000. Thus the total rail shipment of lumber formed a vast bulk of the total and aggregated 2,386,200,000. The total volume of receipts shows an increase of lumber of 536,129,000 feet.

Following is an analysis of the disposition of lumber at Chicago for 1912 and 1911:

	1912	1911
Inventory at beginning of year.....	255,766,107	268,240,000
Receipts during year.....	2,670,696,000	2,134,567,000
Total Stocks	2,926,462,107	2,402,807,000
Inventory at close of year.....	283,811,160	255,766,107
Total Consumption	2,642,650,947	2,147,040,893
Shipments	996,956,000	803,923,000
City Consumption	1,645,694,947	1,343,117,893
Total Consumption	2,642,650,947	2,147,040,893
Increase	495,610,054

It was estimated by the secretary that sixty-five per cent of the total receipts represents hardwood, yellow pine and Pacific coast lumber.

The total enrollment of members, including the original enrollment of January 1, 1912, was 211 during the year. Twenty-four resignations were received, making a total membership of 187 concerns on January 13, 1913. The report then reviewed business and social activities of the association during the past year.

The secretary said that the arbitration committee has been called upon several times and has settled several important controversies, one being of great importance to the whole trade. The decisions in accordance with the charter of the association are as binding as those of the lower courts. The report also touched on the fire limits extension law and the organization of the casualty company. The secretary concluded by thanking the officers and members for their courtesy during the past year.

Secretary Hooper then read the report of the treasurer, which showed total receipts of \$18,416.14; total disbursements during the year, \$18,216.22; leaving a balance of \$200.32.

In the absence of Chairman George J. Pope of the inspection committee, the secretary read his written report. The report pointed out that great good has accrued to the local trade through the efforts of this committee during the past year. There have been 375 inspections made and in not a single instance was the department's inspection overruled.

The Chicago Lumbermen's Association is the only one authorized in its charter to appoint an inspector of lumber; thus the work done by this department is authorized by the state of Illinois, and its findings can be maintained in court. The report then reviewed specific instances wherein the inspection bureau

has actually saved money for the members of the association.

In reporting for the traffic committee, Hermann H. Hettler said that the traffic committee has worked in harmony with railroad interests and that no great difficulty has been encountered in securing equitable adjustment of questions affecting the local trade. He reviewed the co-operation with the Grand Rapids Lumbermen's Association in the matter of over-weights, which question has commanded the close attention of the Grand Rapids association for some time and which has a vast bearing on the entire lumber trade. The Grand Rapids association has compiled a large amount of data bearing specifically on the subject and is better qualified to contest the question with the railroads than is any similar body. Therefore it would appear that decision in the hearing of the question will be decided on the evidence submitted by the Grand Rapids association and special effort on the part of the Chicago association is therefore not warranted. Another subject that has commanded the earnest attention of the traffic committee is the announcement on the part of the transcontinental roads that they will eliminate the privilege of reconignment in transit on shipments from the Pacific coast. According to new schedules of those roads, any wholesaler ordering lumber from Pacific coast mills must give the name of the consignee to the manufacturer and is not permitted to change that name while the goods are in transit. The injustice of this is altogether too apparent to leave room for any controversy. It will simply mean throwing away all the benefit that has been derived from working up the close knowledge of personal trade. It would work a great hardship on the wholesaler handling Pacific coast products.

Fair and adequate classifications on lumber rates, according to Mr. Hettler, is a question which will command the close attention of the trade in the future. There has been considerable agitation along these lines working toward the establishment of rates based on value of product, but very little has been accomplished. The letter from a member of the committee addressed to the secretary, as read by Mr. Hettler, pointed out very definitely the injustice of shipping all forms of forest products on the same relative rates. It can readily be seen that the shipper of hemlock bark, for instance, from a Wisconsin point should not be compelled to pay as high a rate as a shipper of a finished article such as doors, trim, siding, etc., coming from the same point.

Following a short talk by Paul Schmechel, chairman of the publicity committee, President Brown called upon the chairmen of the various divisions, each of whom responded with a brief talk in which the consensus of ideas was that the amalgamation of the varied interests in Chicago has resulted in a vast amount of good for the whole trade.

President Brown then called for report of the nominating committee, which committee submitted the following names for directors:

V. F. Mashek, division A; J. H. Dion, division B; George D. Griffith, division C; E. A. Thornton, division D; Murdock McLeod, division E; John Hansen, division F; C. C. Collins, division G, and Otto S. Lind, division H.

On the arbitration committee the following men were named:

F. J. Heitmann, division A; Fred D. Smith, division B; Frank B. Stone, division C; F. J. Pike, division D; E. A. Lang, division E; Edmund A. Allen, division F, and L. C. Haring, division G.

The nominating committee's choice for the committee of appeals voted the following men:

M. F. Rittenhouse, division A; A. H. Schoen, division B; T. S. Estabrook, division C; George T. Mickle, division D; John C. Spry, division E; F. L. Johnson, Jr., division F, and John Westberg, division G.

President Brown called attention to the fact that the by-laws provided that the retiring and the newly elected board of directors shall hold a joint meeting, at which the retiring members shall inform the newly elected members that they now constitute the board of directors of the Lumbermen's Association of Chicago. The two boards then elect presidents and vice-presidents from among themselves. This will take place on January 27.

Following the report of the nominating committee, the members were highly entertained by Wallace Bruce Hansbury, an eloquist of undoubted ability.

What is a Fair Profit on Lumber

During the past few years attention has been directed more closely to business methods than ever before in the history of the country. Not only has the federal government investigated organizations of large interests with a view to preventing monopoly and insuring competition, but there has even been some serious study of the question of price regulation. While absolute regulation of the price at which goods must be sold seems to be a good deal of a chimera at present, there are some deep thinkers who believe that in the years to come such a method will be worked out and put into effect.

Certain manufacturers in other lines, a well-known shoe company, for instance, has gone so far as to take the public into its confidence, nominally at least, and has announced that its goods are to be sold to the consumer at a profit of five per cent above manufacturing and selling expenses. It may be noted in passing that the shoe company has not featured this plan much of late, though its failure as a publicity idea is said to have been due more to the dislike of the public for the \$3.60, \$4.20 and other odd prices attached to shoes as the result of the adoption of the five per cent plan than to anything else.

Lumbermen in many departments of the field, ranging from the sawmill man to the wholesaler, broker and retailer, are complaining of a shrinkage in profits. The cost of doing business is steadily going up, and apparently it has not been possible to put all of the increased expenses into the selling price, which, after all, is governed by business conditions and competition just as much as it is by the necessities of the manufacturer and dealer.

The question is naturally arising, "Am I making enough money out of my business? Are my profits normal now, or were they too large heretofore? Ought I get into the five per cent class, along with the shoe manufacturer and others who are acknowledging a willingness to let that increment represent the net profits of their business?"

In order to get a fair line on the correct basis for figuring profits in any business, one must have some knowledge of the rapidity of the turnover. That is the whole story, as far as determining a correct amount for the profit account. Merely realizing this fact at once puts the lumber manufacturer out of the class of the shoe maker, the clothing manufacturer and others who need use no such laborious and time-consuming processes as are required in the lumber business. And the lumberman who forgets this in determining what his profits should be is leaving out of consideration the vital and conclusive factor.

From the time the log is received at the mill until the lumber is shipped out is supposed to be not more than six months. Taking this as a basis, it is evident that the sawmill man who keeps his stocks on sticks for six months can turn his capital over but twice a year, at the maximum, not allowing for special conditions which may enable him to ship certain kinds of stock green, because of the pressing demand, or may compel him to hold certain other lumber on his yard for two years or longer because of the poor call for that particular item.

And as a matter of fact it is not possible to turn his money over twice a year, figuring a seasoning period of six months, for the reason that the credits extended must be taken into account. If the money represented in the lumber were to be paid as soon as it is loaded into the car, the idea would be carried out; but inasmuch as at least thirty days' time is given, and frequently much more, the period required from the time the board falls from the saw until the money for it is credited to the account of the manufacturer at the bank is pretty close to eight months.

The credit facilities of the lumber manufacturer of some size of course enable him to do a larger volume of business than his actual capital would indicate. Therefore the proportion of the volume of business done to the capital invested is probably greater than 4:3, as would be suggested by the foregoing. But, taking the sawmill

man as a general proposition, it is quite evident that a turnover of the capital invested twice a year would be a good showing, in view of the long period required for the seasoning of the lumber after it is manufactured.

The question is complicated, of course, by the fact that many sawmill owners who have little capital are financed by wholesalers and frequently get their money out of a lumber proposition before the stock has been put on the sticks. But, on the other hand, the financing of a sawmill necessarily involves a charge for the service, the profits of the manufacturer being cut down by the necessity of borrowing on the lumber that he is going to cut. He discounts his prospective sales, and, like every banking operation involving a discount, the man who furnishes the capital must make a charge for it.

However, assuming that the sawmill owner can turn his money over twice a year, and that he sold his output at a five per cent margin, the figure suggested by manufacturers in the other field, he would make a net profit on his investment of ten per cent. How would this compare with the shoe and clothing trades, to which reference was made at the beginning? Here are some facts taken from the experience of a clothing manufacturer, who is an acquaintance of the writer.

His capitalization is \$100,000, and he does an annual business of \$350,000. He has two selling seasons, spring and fall, and owing to the long datings given in that business it takes him six months, as a rule, to realize on his output. But, in spite of this, by means of the use of his capital and the money he can borrow from the banks, he turns his resources over three and a half times a year. He gets a minimum of five per cent net on this business, so that his minimum earnings are seventeen and one-half per cent on his capital. If the sawmill man earned but five per cent on his sales, the clothing manufacturer would have done seventy-five per cent better as to net profits than the lumber manufacturer.

In order to equal the results made in the clothing business, the lumberman would have to make at least eight and three-quarters per cent on his sales. And if his turnover is accomplished only once in eight months, a minimum of eleven and two-thirds per cent would have to be realized in order to enable him to equal the showing of the five per cent business of the clothing manufacturer.

The wholesale lumberman is confronted with a good many of the same problems as the sawmill man. He must yard and rehandle his stock and hold it for a longer or shorter period, depending partly upon the necessities of seasoning and partly on market conditions. His turnover should be more rapid than that of the manufacturer, though it is not nearly so fast as it is in a number of other businesses, where the jobber does a business six to eight times as great as his capital. This is because profits in the wholesale field in almost every branch of trade have diminished steadily, and increasing the volume of business has been the only solution of the problem.

Another fundamental consideration which affects the proposition is with reference to the raw material. The lumberman manufactures trees, which are produced slowly and which frequently are held for a long time before being cut. The interest on the capital tied up in this way must be considered, if the manufacturer owns his own timber, as well as the movement of the log from the stump to the mill. Considering the fact that the sawmill man's money is put out practically as soon as the tree is felled, the period covered by the development of that expenditure into profits resulting from the sale of the lumber is very greatly increased, making additional profits necessary in order to equalize the proposition.

The manufacturer in most other lines pays for his material after it is delivered to him, ready to use; and frequently has his own product on the market and is realizing returns before it is necessary for him to pay for the goods which he has consumed. This reduces the outlay of capital necessary to produce a given volume of busi-

ness, just as in the other case it makes a greater outlay by the lumberman necessary in order to pile up business of that amount.

In every direction, therefore, practical conditions make it impossible for the lumber operator to realize upon his investment as rapidly as manufacturers in most other lines; and the fair conclu-

sion, then, is that the sawmill owner, as well as his collaborator, the wholesale yard man, is entitled to a much larger profit upon his product than is justly accorded to the producer of goods which can be manufactured and sold more rapidly and more easily than lumber.

G. D. C., Jr.

Distinguishing Between the Gums

There are several trees of this country commonly known as gums. One of them, the red or sweet gum, belongs to the witch hazel family (*Hamamelidaceae*) and bears no close relation to black gum, water gum, tupelo and sour tupelo which are in the dogwood family (*Cornaceae*). The name "gum" is also applied to several species of eucalyptus.

Red or sweet gum (*Liquidambar styraciflua*) is widely distributed through the swamp forests of the eastern United States from southwest Connecticut to Texas. It reaches its best development on low bottomlands subject to overflow in the basin of the lower Mississippi river and in the coastal region of the south Atlantic states. In the northern portions of its range it is a medium sized tree but at its best there are few that can equal it for size, straightness of trunk, and clear length.

The wood is rather heavy, the average weight of thoroughly dried material being thirty-seven pounds per cubic foot or about ten pounds lighter than white oak. The specific gravity is 5.9. The wood is moderately hard, fine-textured, often with cross or interlocked grain which interferes with working and makes boards very liable to warp. There are no large pores but the numerous small ones are scattered throughout the wood and are scarcely visible to the unaided eye. The rays are fine but distinct. The color is reddish brown, usually with irregular dark streaks producing a "watered" effect on a smooth longitudinal surface resembling closely the markings in Circassian walnut. The sapwood is nearly white, in some trees being quite thin, in others making up a very large proportion of the trunk.

Red gum was rather late coming into commercial importance, largely on account of the difficulties of handling the lumber under the careless methods usually employed. Proper attention to time and methods of logging, to sawing, and to piling, seasoning and handling the lumber has changed all this so that many industries could scarcely exist without it.

In 1910 this wood stood eleventh in production of sawed lumber with a cut of 610,000,000 feet. This was nearly 100,000,000 less than in 1909. The lumber was cut at 3,716 mills in 22 states. Arkansas furnished 30 per cent of the cut and Mississippi a little over 24 per cent.

In the production of slack cooperage staves red gum is an easy leader with a third of a billion or 22.3 per cent of the total in 1910 as against 18.3 per cent of pine, the nearest competitor. Nearly three-fourths of these staves were made in Missouri and Arkansas. In slack heading red gum ranks fourth with over 11,000,000 sets out of a total of nearly 100,000,000.

Red gum has gained a good foothold in tight cooperage and in 1910 furnished 23,000,000 sawed staves, or 7.5 per cent of the total. It furnished 4.2 per cent of the oil and tierce staves, none of the spirit, wine, Bourbon and pork staves, but a larger share of the half-barrel staves, cut-offs and lead staves. In the production of tight cooperage heading red gum ranked fourth with 975,540 sets of 4 per cent of the total in 1910.

Red gum is much more widely used for veneer than any other wood and for the last four years upon which statistics are available constituted approximately thirty per cent of all wood used. The large increase in consumption over other woods is due to the fact that it is considered an ideal wood for the rotary machine and that the stumpage is more easily obtained than that of any other wood except yellow pine. The tendency of red gum to check and warp when used as lumber is overcome by converting it into veneer. Not only does it

cut readily but with improved driers is easily kiln-dried. It takes glue readily thus making it valuable for built-up stock, where it can be used either as face wood or cross banding. The total amount of red gum consumed in 1910 in the manufacture of veneers was over 158,000,000 feet log scale. It is used for packing boxes, veneer barrels, fruit baskets, chair bottoms, drawer bottoms, three-ply lumber, butter dishes, and wooden plates. Some of the finest rotary cut veneer is finished to imitate Circassian walnut.

Red gum is much used for furniture, but very often under some other name than its own. In European markets it is known as "satin walnut" and is in considerable demand. Italy admits all timbers, except cabinet woods, duty free. Misled by the name "satin walnut" and the optimistic claims of the exporters of this wood, red gum was for a time subject to an import duty of ten dollars per thousand. Getting the matter adjusted without retracting anything was a diplomatic feat of high order. It is said that red gum furniture is reshipped from Italy and France to this country and sold under the name of French and Italian walnut.

Gum lends itself readily to imitation of other woods by staining and printing. The sapwood can be put through a machine with a brass die and reddish ink and made to look like Spanish cedar with the reddish markings in it. Printing plates are made from impressions taken directly from oak, mahogany or other wood it is desired to imitate, and with the proper color of ink it is possible to feed in gum and take out a figured wood. None of these, however, can compare with the natural beauty of "watered" or "clouded" specimens of the gum wood.

The other important gum woods belong to the genus *Nyssa*. All except the sour tupelo yield woods that are now being used extensively for commercial purposes. While the trees can be readily distinguished in the forest, the woods are less easily identified and are usually sold together as tupelo. There is considerable variation in the characteristics of wood from different trees of the same species, which adds to the difficulty of ready separation by superficial characters.

The heartwood of these gums is not always easily distinguishable from the sapwood, which is quite thick in all species except sour tupelo. The color varies from nearly white to cream-color or light brown in some cases. The wood is light, soft, tough, fine and uniform textured, cross-grained, and difficult to split. Of the four the black gum is considerably the hardest and heaviest. The wood of the others is easily indented with the thumb nail.

Tupelo was rather slow coming into use in this country, there being much the same prejudice against it as against red gum. It has long enjoyed a sale in European markets under the name of "bay poplar." The home demand for it is rapidly increasing, especially so as the supply of other timbers is being reduced.

It is well adapted to a great many purposes. Its uniformity of color and texture, its freedom from knots and defects, the large size and quantity in which it can be obtained, the readiness with which it takes paint and stain, are features which far outweigh the difficulties of manufacture and seasoning of the lumber. The cut of tupelo lumber in 1910 was over 92,000,000 board feet. This figure includes lumber from all species of *Nyssa*. The cut of the wood previous to 1906 was too small to warrant separate tabulation and in that year about 48,000,000 feet was reported. Louisiana is the center of production.

In 1907 tupelo was just beginning to be heard of as a slack cooper-

age wood, producing 2,000,000 staves and a little over 200,000 sets of heading. In 1910 nearly 31,000,000 staves and 3,000,000 sets of heading were made of this wood. North Carolina contributed over 72 per cent of these staves.

Tupelo is also making rapid gains as a veneer wood, the amount consumed in manufacture of veneers in 1910 being nearly 27,000,000 feet, log scale. It is also used for interior finish, ceiling, flooring for warehouses, factories, railway depots, offices and dwellings, boxes and crates, wagon box boards, furniture, laundry appliances and woodenware. It does not splinter and holds nails firmly without splitting.

Tupelo or cotton gum (*Nyssa aquatica*) occurs in deep swamps inundated during a part of every year along the southern Atlantic coast region and in the lower Mississippi and Wabash valleys. It is of greatest size in the cypress swamps of western Louisiana and eastern Texas. It forms large, straight trunks, though with abnormally large base, not unlike that of cypress.

The wood is almost uniformly white, with now and then a slight tinge of yellow. The weight of thoroughly dry wood is 34 pounds per cubic foot; specific gravity .54. The pores are scarcely, if at all, visible to the unaided eye, are numerous and evenly distributed throughout the growth ring. The wood fibers have rather thin walls and large cavities, which accounts for the softness of the wood. There is little contrast between the wood formed at different times of the year, consequently the annual rings of growth are not conspicuous and the texture is uniform. The wood of the lower part of the buttresses is very light and soft, due to the very thin walls and comparatively wide cavities of the cells. It is called corkwood and is used largely in the preparation of tupelo-sounds.

Water gum (*Nyssa biflora*) is distributed from Maryland to Florida and central Alabama. It is a rather small tree with a much enlarged base. The wood is moderately soft and heavy, not strong, though very tough and very difficult to split. The weight of the dry wood is 31 pounds per cubic foot; specific gravity .50. It appears in the market as tupelo and is not readily distinguished from it. As a rule it is more cross-grained and difficult to split than tupelo (*Nyssa*

aquatica), and the annual rings of growth are wider. In tupelo the pores are often arranged radially, but in water gum the distribution is more or less even throughout.

Black gum (*Nyssa sylvatica*) is also known as sour gum, tupelo and pepperidge. It is widely distributed throughout the eastern half of the United States. It often reaches large dimensions, particularly in the southern Appalachians.

The wood is rather hard, heavy, strong, very tough, extremely difficult to split, close-grained and uniform textured. The heartwood is cream-colored or sometimes very light brown; the sapwood is white and usually quite thick. The weight of dry wood is 40 pounds per cubic foot; specific gravity .64. The pores are small and less numerous than in the preceding species. The wood fibers have thick walls and small cavities, which accounts for the greater weight, hardness and strength of the wood.

The wood of black gum is very hard to season. It is so tough that it can be successfully used for the hubs of wheels, rollers in factories and mines, ox yokes and sometimes for the soles of shoes. It is possible that it might prove suitable for shuttles which require a wood that will resist wear and take a very high polish with use. The wood, like that of the other gums, is not naturally durable in contact with the soil. If creosoted, however, its lasting qualities are excellent. Its use for fuel is limited on account of the difficulty in splitting.

In the report of the wood-using industries of Massachusetts the following uses of black gum are enumerated: "Agricultural implements, furniture, gun stocks, interior trim, panel work, piano trusses, pipe organs, porch posts."

Sour tupelo (*Nyssa ogeche*) is a medium-sized tree of local occurrence in deep swamps in the extreme southeastern coast region of the United States. The wood is light, soft, not strong, tough, and splits with less difficulty than that of any other of the gums. The weight of the dry wood is 33 pounds per cubic foot; specific gravity .53. The rays are wider than in the other species, and the pores are much larger and unevenly distributed. The wood fibers have thin walls and large cavities.

S. J. R.

Michigan Manufacturers Meet

The mid-winter meeting of the Michigan Hardwood Manufacturers' Association was held on Friday, January 24, at the Pontchartrain hotel, Detroit.

The roll call showed that thirty members were in attendance. Three new members were admitted to membership. This business was followed by the report of the secretary, which was in part as follows:

Secretary's Report

The year 1912, from the standpoint of the lumber manufacturer, has been a remarkable one, and to find anywhere near a fair comparison we have to go back to 1906.

The outlook for 1913 from a manufacturer's standpoint is very optimistic and I have yet to find a pessimistic manufacturer. We believe that the reports shown here today will carry out that impression and prove to be the forerunner of another successful year.

Our stock reports give the figures of sixty-four members, one less than reported a year ago. We consider this a very good showing, taking into consideration the fact that quite a number of our members have cut out this year.

The sixty-four reports for January, 1913, form a very fair comparison with the sixty-five reports of one year ago.

At this writing the secretary has collected in all but one assessment in the Forest Fire Protective Department and five assessments in the general fund, and we have the promise that these amounts will be in our hands very soon. Our assessment on shipments of hardwoods from Oct. 1, 1911, to Oct. 1, 1912, has yielded us 342,510,328 feet, amounting to \$6,850,266, as against 313,853,219 feet a year ago, amounting to \$6,277,055. We have a sufficient amount in our Forest Fire Protective Department fund to carry on the work well into the coming season.

There isn't a manufacturer present that is not vitally interested in the working of the new employers' liability act, which became effective Sept. 1, 1912. I learn that a large majority of our members have signified their intention of coming under the act and have filed their

acceptance of same with the secretary of a State Industrial Board. Some of the members are letting the state carry their insurance, while others are taking care of their own losses on basis of the state liability law.

The secretary's office at the request of some of our cargo shippers has been disseminating information regarding values of lumber shipped by cargo and this information has been mailed to the cargo shippers only, with the exception that the information has been placed in the hands of all members of the market conditions committee. One reason for not giving this information to the car shippers, was the probable influence which some of the lower values of cargo shipments might have on the car trade. Let me state here that it was not and is not the intention of the secretary to discriminate between any interested in the association and that the information at hand is open to each and every member. If it is thought best by the members present to send all of this information to each and every member, we will gladly do so.

You will note that for some time a large majority of the manufacturers have felt that there should be some changes in the rules for the grading and inspection of hardwood lumber. Your grading rules committee in conjunction with the bureau of grades of the Northern Hemlock and Hardwood Manufacturers' Association, met the inspection rules committee of the National Hardwood Lumber Association in Chicago, Jan. 13, 1913, when it was agreed to present again at the convention to be held next June in Chicago practically the same rules as were refused us a year ago, and we are hopeful that this time they will be carried. Chairman Day will make a report on this subject today.

Your secretary has been handling the Pacific coast rate case for a long time and is pleased to advise that the final hearing on the subject was held before Interstate Commerce Commissioner Prouty in Chicago, Jan. 20, and we are looking for an order from the commission allowing reparation on shipments of lumber, etc., to basis of an eighty-cent rate, carrying the rate back several years before the railroads published that rate.

The secretary desired to call attention to the members of the proposed changes in the Michigan class rates. Perhaps you are not aware, but it is a fact that the railroads in Michigan have been re-checking class

rates with a view to lining up their rates in the lower peninsula of Michigan and that there are likely to be some advances. For example, lumber takes sixth class in carloads in the official classification; fourth class in less than carload lots. Lumber in Michigan that is practically on the commodity basis less than sixth class. For example, the rate on one hundred miles on lumber today is seven cents for that distance. The new sixth class rate for one hundred miles is $8\frac{1}{2}$ cents for one hundred pounds. After the class rates are established, what is there to prevent the railroads from withdrawing the commodity rates and using the regular classification basis, which would mean quite a stiff advance?

The treasurer's report showed receipts \$9,550.87 and disbursements of \$2,369.72, leaving a balance January 16 of \$7,181.15.

The report of the forest fire department showed receipts \$4,099.80; expenses, \$620.13, with balance January 16, \$3,479.67.

Vice-president C. A. Bigelow, who officiated in place of President F. L. Richardson, in his absence, asked for a resolution on the death of F. W. Gilchrist, and appointed a committee to draw up such a resolution.

The report of the grading rules committee follows:

According to instructions received from the association, the grading rules committee met together with the committee from the Northern Hemlock and Hardwood Manufacturers' Association, in conjunction with the National Hardwood Lumber Association at Chicago, January 13, for a further consideration of the rules previously submitted. The sentiment of the members of the National association committee was to reopen the subject, which the Michigan committee was not inclined to do. It was finally decided to accept the report as presented, and the National association committee take action on the same.

Chairman Day stated that as a member of the committee he could take no other stand than the one already presented, with the result that practically all the points which were asked for were conceded. One exception was taken in the matter of five-inch strips being included in the seconds. It was stated that this was the principal point which raised the objection last summer. If the Michigan and Wisconsin associations would concede this point there will be no difficulty in passing the present suggestion. Under these conditions, Chairman Day stated that he had agreed to take up the matter with the Wisconsin and Michigan delegates. All of these delegates were willing to concede this point with the understanding that paragraphs six, eight and nine should be changed to a new paragraph to read as follows:

"Ten per cent minimum width mentioned in all grades may be one-quarter inch scant." This was accepted. The original reading was:

"Minimum width mentioned in all grades of firsts and seconds as four and five inch must be of full width, five per cent of the minimum width mentioned in all other grades, making one-quarter inch scant."

Chairman Day said that this was his recollection of all the changes that were made with the exception of a few minor ones as to the grading in white maple. He concluded his report by urging all members to attend the coming meeting of the National Hardwood Lumber Association in the interest of the proposed changes in hardwood rules.

Chairman Hickok reported on the work contemplated for his department for the coming year, and outlined a system of preparing maps showing the whole territory and all conditions. His work and his report were warmly commended by the association, and the latter was adopted.

The report of the market conditions committee as submitted by Chairman Bruce Odell is summarized as follows:

Stock report shows an unusual decrease in both the total of the hardwood lumber at the mills and the amount unsold. The decrease during the year 1912 amounted to thirty-six per cent. The stock of hardwood lumber on hand January 1, 1913, was less than sixty per cent of normal. Of this there was more than seventy per cent sold. The largest decrease shown is in beech, there being only about forty per cent of the normal stock on hand at present. The stock of birch shows about the same. Stock of maple shows less than sixty per cent of normal, and maple flooring about the same.

The comparatively warm and open winter curtailed logging output so that it will not be possible for manufacturers to increase their cut during 1913. January aspects indicate a decrease in hardwoods of fifteen million feet from 1912.

Attention was called to the valuable information furnished in regard to annual cut. Estimates for 1912, 417,000,000 feet, and the actual cut, 406,000,000 feet, a difference of less than three per cent.

Chairman Odell called attention to the fact that if the producers can start the year knowing how much available stock there is on hand, and how much will be consumed during the year, the information is worth the cost of the association work.

Chairman Odell also referred to the increase in demand for mixed soft elm during the last six months, which has resulted from an increased demand from automobile manufacturers. More maple is also produced in automobile manufacture. It is estimated that in Detroit in 1913 over fifty million feet of maple will be consumed.

C. A. Bigelow talked on the state employers' liability act, stating that under this act and under the insurance commission ruling, employers of labor would be able to get liability insurance at cost. It is intended to create a surplus, one-half of which will revert back each year to the credit of the preceding year's premium.

The members discussed the question and it was concluded that the matter was of considerable importance to all employers of labor.

TRAFFIC MATTERS IN MEMPHIS TERRITORY

The Southern Hardwood Traffic Bureau has been organized here. It succeeds the Lumbermen's Traffic Bureau of Memphis which was launched here during the summer. George D. Burgess, of Russe & Burgess, Inc., is president; Walker L. Welford is first vice-president and J. D. Allen, Jr., treasurer. J. H. Townsend, who was manager of the Lumbermen's Traffic Bureau, occupies a similar relation to the new organization. There is a board of managers composed of fifteen lumbermen, whose terms of service are divided as follows: One year—L. E. Brown, O. M. Krebs, Frank May, S. M. Nickey and John W. McClure; two years—John Dwyer, S. C. Major, W. S. Darnel, C. M. Green and James E. Stark; three years—D. D. Nellis, C. B. Dudley, W. A. Ransom, F. F. Fee and W. B. Morgan.

The principal purpose of the new organization will be the maintenance of equitable freight rates and facilitating the settling of claims. It is regularly incorporated under the laws of Tennessee and the change of name and incorporation has been made with a view to allowing prominent lumbermen outside of Memphis to become affiliated with this bureau. There are a number of rate contests before the Interstate Commerce Commission affecting Memphis and all points in the Central South and the bureau will be quite busy with these during the next few months. Preparations are now being made to argue these cases before the commission which has suspended the advance pending hearing.

The Southern Hardwood Traffic Bureau has already petitioned the Interstate Commerce Commission to suspend the tariff recently filed with that body by the Texas & Pacific Railroad. This new tariff, unless suspended by the commission, will become effective about March 1. The advance will affect tupelo gum from all points along the Texas and Pacific to Mississippi and Ohio river crossings and also ash and oak from all main line points on the railroad to Mississippi and Ohio river points. The extent of the scheduled advances is two cents a hundred pounds. The lumbermen will, if they secure an order of suspension, make an effort to present testimony showing that present rates are high enough and that any advance will be unreasonable.

No definite date has been set by the Interstate Commerce Commission for the hearing in the Anderson Tully case, which involves the issuance of through bills of lading on hardwood lumber shipments from points west of the Mississippi river. It is understood that this hearing will be held in New Orleans, but no definite time has been fixed. There is a great deal of inconvenience and loss to lumbermen in the present system of shipping on local bills to ship side, and the lumbermen here are very desirous that this matter shall come up at an early date and that at the next hearing it may be finally disposed of.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 383—Poplar Moldings Wanted

London, E. C., Jan. 8.—Editor HARDWOOD RECORD: We would be pleased to have you advise us of anyone you know of who will make poplar electric casings. Anybody making poplar moldings would be satisfactory, and we would be able to tell them exactly how to make them so as to save not only wood but a lot of labor.

The above inquirer has been supplied with a brief list of manufacturers of poplar mouldings.—EDITOR.

B 384—Seeks Poplar and Cottonwood

Houston, Tex., Jan. 13.—Editor HARDWOOD RECORD: We are in the market for cottonwood and poplar in different sizes—also panel stock.

WORKS.

The foregoing correspondent has been given the names of various facturers of popular moldings.—EDITOR.

B 385—Wants Market for Excelsior

Pulaski, Va., Jan. 14.—Editor HARDWOOD RECORD: Would you kindly give me some buyers of excelsior and an idea of the best woods to use for this purpose?

Thanking you in advance for any information you may be able to give, I am.

The above party has been advised that the principal buyers of excelsior are manufacturers and wholesale merchants who do a lot of packing, such as dishes, bottles, hardware, lamps, furniture and small articles generally. A little excelsior is used by upholsters.

The excelsior makers of North Carolina use white pine, yellow pine and yellow poplar. Most soft, stringy woods answer, such as spruce. The markets for excelsior are generally in nearby towns and cities, as it is not usually shipped far.—EDITOR.

B 386—Has Hardwood Ashes to Offer

Halifax, Nova Scotia, Jan. 13.—Editor HARDWOOD RECORD: I would feel much obliged if you would give me the names of dealers of hardwood ashes in any part of the United States.

The writer of the above letter has been informed that the buyers of wood ashes in this country are mostly manufacturers of fertilizers, although the pearl ash and potash people buy some. He was further told that he could probably obtain the addresses of firms in this business from trade and city directories in districts where he wished to do business.—EDITOR.

B 387—Attention Oak Manufacturers

San Francisco, Cal., Jan. 15.—Editor HARDWOOD RECORD: We are interested in getting figures from eastern mills on a quantity of a million feet oak lumber, plain and quarter-sawed, and would appreciate your putting us in touch with some mills that will be able to quote us.

Hoping that our little request will merit your prompt attention, we are,

COMPANY.

The above concern is a prominent wholesaler in San Francisco and has been supplied with a list of manufacturers of the lumber for which it is in the market.—EDITOR.

B 388—Wants Beech Drawer Sides

Salem, Ind., Jan. 20.—Editor HARDWOOD RECORD: We have been requested by you in the past to fill out list showing stock we wanted, which we have not done as we have been able to supply our requirements without this. However, we see quite a number of furniture people are using beech drawer sides and we presume they are buying these already worked to their special sizes.

If you know of anyone who is manufacturing beech drawer sides, we will be glad to have you put us in touch with them.

The above correspondent has been supplied with a list of concerns likely to be in position to supply this stock.—EDITOR.

B 389—Denial of Authenticity

Memphis, Tenn., Jan. 20.—Editor HARDWOOD RECORD: Referring to article in your issue of January 10th of the HARDWOOD RECORD, which

you state is an interview by a HARDWOOD RECORD representative, would state I have never been interviewed by one of your representatives, nor have I given anyone permission to publish such an article and the statements made as coming from me direct are without foundation. Moreover, such statement would most certainly injure Russe & Burgess, Inc., and myself with foreign brokers, and I request that you print in your next issue an article stating the matter given you by your representative was not received by him from me, and that I had nothing to do with it whatever.

Yours truly,

G. A. FARBER,

Sec'y, Russe & Burgess, Inc.

News Miscellany

Lake States Forest Fire Conference

Delegates to the second annual meeting of the Lake States Forest Fire Conference, held at Lansing, Mich., Jan. 21 and 22, declared for separation of the state fire warden's departments from politics, efficient forest patrol, and co-operation between state and private fire associations. The conference was made a permanent organization and the following officers elected: President, Filbert Roth, head of the forestry department of the University of Michigan; vice-president, F. B. Moody, state forester, Madison, Wis.; secretary-treasurer, F. B. Wyman, secretary Northern Forest Protective Association, Munising, Mich.

The legislative committee recommended absolute divorce of the game and forestry departments; that the work of forest protection and administration be placed in the hands of a competent and non-partisan board; the appointment by board or commission of an expert and competent forester together with necessary assistants who shall have charge of and have supervision over all forest administration and protection; general forest and fire laws along lines of the present Minnesota law; a law to embrace a well considered forest land policy; a new tax law with annual land tax based on soil values, and timber tax based on value of timber at the time it is removed from the land; the appropriation of sufficient funds to enable state forester to enforce to the full all existing forest and fire laws and such others as may be passed.

It was contended, especially in Michigan, that the fire protection with game protection is a poor mixture and inefficient for the reason that residents of the timberlands are generally antagonistic to game wardens and do not co-operate with them.

The conference adopted resolutions asking and urging the lake states and the province of Ontario to provide larger appropriations for fire protection; to form new associations for fire fighting; to co-operate with all forest fire fighting organizations; to oppose any transfer of forest reserves to states by the United States government, as the fire fighting efficiency was greater under the federal government's supervision; to urge and advocate the development of institutions turning out trained men; states to reserve non-agricultural lands.

One of the most interesting papers read was that by William T. Cox, state forester of Minnesota, on "Minnesota's Progress Under Her New Forest Service Law." The Minnesota law is said to be the most perfect in the Lake States. E. J. Zaritz of Guelph, Ontario, gave a resumé of Ontario's fire fighting experiences. The revenues from the government's timber average about \$1,500,000 a year, and she has large areas of virgin white pine to protect. Weakness in the system, however, was shown by Mr. Zaritz to be due to lack of facilities for communication.

Subjects of papers were as follows: "Fire Fighting in the Pacific Northwest," Prof. P. S. Lovejoy, formerly of the U. S. Forest Service, but now of the Michigan University; "Methods of Preventing Railroad Fires Used by the Chicago, Milwaukee & St. Paul Railroad Company," J. F. Lovejoy, Milwaukee, Wis.; "How the Railway Fire Situation is Being Handled in Canada," Clyde Leavitt, Inspector for Railroads, Ottawa, Canada; "Prevention of Railroad Fires in New York State," William G. Howard, assistant superintendent forests, Albany, N. Y.; "A Discussion of National Forest Service Work in Michigan," William B. Piper, East Tawas, United States supervisor; "Influence of Fires Upon Settlement of Lands," J. H. McGillivray, Oscoda, Mich.; "State Co-operation Under the Weeks Law," J. Girvin Peters, United States Forest Service, Washington, D. C.; "Railroad Fire Situation in Michigan," W. R. Oates, game warden, Michigan; "Patrol and Fire Prevention," Charles F. Hickok, chief warden of the Michigan Hardwood Manufacturers' Association, Gaylord, Mich.

The conference was well attended by many Michigan officials, representatives from associations, organizations and governments of Minnesota, Wisconsin, Ohio, New York and Ontario.

Better telephone service was urged as well as the construction of wooden watch towers, firebreaks, burning of brush under warden's supervision, and co-operation with railroads.

Meeting of Wood Preservers

The annual meeting of the American Wood Preservers' Association was held in Chicago, Jan. 21, 22 and 23, and, as usual at the meetings of this association, a number of excellent papers were presented. The longest was by W. F. Goltra and went somewhat fully into the history of wood preservation in the old world as well as in the new. The treatment of

wood to hinder decay is supposed to date a good while back of the Roman empire; but it began to assume modern form about two hundred and fifty years ago. However, the use of treated wood on a large scale began when the increased cost of ties forced the railroads to adopt methods of prolonging the service of the ties. Forty-seven different methods of timber treating had been discovered and put into use up to 1846. Most of these were based on the principle of poisoning the wood, either on the surface or within, to prevent attacks upon it. Some of these treatments were directed against boring worms and other insects rather than against decay-producing fungi.

H. L. Collier's paper on the efficiency of yellow pine paving blocks proved a strong argument in favor of that material. The argument was backed up with facts collected in many cities where the pine blocks had been put to severe tests. A dozen or more points of superiority were claimed for the pavement, among which were these: It is sanitary and durable; is reasonable as to first cost; can be repaired easily and economically; it offers the least resistance to traffic; furnishes good foothold for horses and takes care of the automobile; it is easily cleaned and is nearly noiseless; it possesses elasticity; is nearly dustless; the surface wears uniformly smooth; the material is not easily affected by climatic changes.

The author of the paper suggested a number of improvements by which the block pavement may be made more efficient. The chief of these are, better foundations; better spaced joints between the blocks; more careful fittings around openings and next to the curbing; and several other improvements in mechanical devices for laying and adjusting the blocks.

David Allerton's paper advocated preliminary treatment of certain timber to insure a more uniform and satisfactory impregnation with creosote.

Dr. Hermann von Schrenk's paper on the requirements for successful timber treatment pointed out a number of matters which should be carefully considered. The first was that none but perfectly sound timber must be treated. It was said that it not infrequently happens that timber is already in incipient or even advanced stages of decay when it reaches the treating plants, and of course no process can make such wood sound. Other points to be considered are, that none but properly seasoned timber be treated; a good preservative is essential to long life; and proper injection is essential as to quantity and penetration. Proper subsequent handling of the timber is essential also.

A paper presented by James A. Lounsbury considered the advisability of adzing and boring railroad ties before they are given preservative treatment. It was shown that most ties are somewhat out of true, and must be cut and pared to give the rails a flat surface to rest on. This adzing of a treated tie cuts through a part or the whole treated shell and exposes untreated wood to the elements of decay. The same thing occurs when the tie is bored for the spike. By boring and adzing first and treating afterwards, no raw wood is exposed.

It is stated that of the 150,000,000 ties used annually in the United States, 74 per cent are hewed, and 24 per cent are sawed. The spike holds with more firmness if driven into a bored hole a little smaller than the spike, than if driven directly into the wood, hence the reason for boring.

The efficiency of piecework in handling ties and timbers was discussed by W. W. Eldridge of the Burlington & Quincy Railroad, who claimed that one-third of the men can be dispensed with, in converting a per diem crew into a piecework crew.

A technical paper was presented by F. M. Bond, of the Forest Products Laboratory of Madison, Wis., giving the result of tests made to determine the effect upon absorption and penetration of mixing tar with creosote. The conclusion was that tar hindered the penetration of the creosote.

Annual of American Forestry Association

The proposed placing of control of the national forests in the hands of the states was the question which commanded the greatest interest of the thirty-second annual convention of the American Forestry Association, which took place at the New Willard hotel, Washington, D. C., on Jan. 8. Gifford Pinehot, ex-chief forester of the United States, delivered an earnest address in which he attributed the movement to the various interests that, before the activities of the Forest Service were felt, reaped great personal aggrandizement from exploiting illegally the timber, mineral and grazing resources on the areas now within the forest reserves. Mr. Pinehot said that one of the greatest evils has come through the illegal acquisition of such lands by capitalists who operated under the timber and stone act. The method was to employ crews who took up quarter sections of land and after thus securing the title to the land conveyed it to the various people in question. Under the present supervision of the Forest Service the lands are sold outright and at figures commensurate with their real value. The real reason for the agitation in favor of state control is the fact that the Forest Service has been found incorruptible in its policy of honest administration and the interests in question have come to realize that they stand a better chance of securing their desired ends through the various state administrations if it can be arranged that the states have control of these vast resources.

Chief Forester Henry Solon Graves advocated a thorough educational campaign with the purpose of educating the public to the features of the government's land policy. The same education is necessary in connection with familiarizing the American public with the policy regarding the forest administration. He said:

I am impressed every day by the confusion that exists in the public mind relative to forestry and conservation. The greatest misconceptions exist regarding our aims and methods. Many see nothing in forestry aside from the protection from fire; another group regards forestry altogether as reforestation; others conceive of forestry as identical with park administration for scenic purposes; others would conserve forests only for watershed protection; another class will not concede that forestry means anything but good logging and good utilization; and there are a large number of persons—and they make themselves prominently heard—who believe, or pretend to believe, that forestry means locking up our timber resources, without present use, for future generations. In other branches of conservation there is even greater ignorance than in forestry. In fact it would not surprise me much if a certain amount of educational work would not be altogether lost on many persons right in this room. I wonder, for instance, how many appreciate the significance of the problem of regulating the public range and its relation to every day life; how many have an adequate idea of the fundamental questions underlying the present efforts to secure a right plan for the regulation of the use of waterpower sites on public lands and on navigable rivers.

President Henry S. Drinker of Lehigh University, the newly elected president of the forestry association, said that forestry has been styled "the keystone of conservation" but that in his opinion a more apt designation would be "the foundation or beginning of the conservation movement." Mr. Drinker outlined the work on conservation in Pennsylvania and more specifically at Lehigh University in the way of teaching forestry. He outlined the course of conservation from its infancy and showed the means through which its principles had been exploited. He said that the two enemies of forestry had been forest fires and unwise taxation. The country, however, has been awakened to the fire danger and there is no question, according to the speaker, but that an intelligent appreciation of the taxation evil is also growing. He recommended that the association consider the feasibility of devising a plan whereby a reasonable annual tax may be imposed upon timberland with a preferred tax upon timber to be assessed and paid when cut, in order to prevent the early cutting of timber by owners who claim that they cannot afford to conserve it under present taxation.

Walter L. Fisher, secretary of the Interior, spoke on the electrification of transcontinental railroads. He said that the grant of the Great Falls Power Company, a company which will supply power to electrify a section of the Chicago, Milwaukee & St. Paul railroad, is really the beginning of a policy to electrify 20,000 miles of transcontinental railroads.

In closing, the association elected new vice-presidents and directors.

A smoker was held in the evening, at which Representative Lamb of Virginia, chairman of the House Committee on Agriculture, said that there is no sentiment in Congress which would indicate that that body contemplates in any way turning over the control of national forests to the state. The speaker said that he personally opposed any measures that would act in opposition to the conservation policies of the government. Representative Lamb was followed by Representative Lever of South Carolina, who is the logical successor to the chairmanship of the committee on agriculture beginning with March 4 next. Mr. Lever expressed himself as having sentiments very similar to those of Mr. Lamb. He said that a liberal policy in connection with conservation movement would undoubtedly be followed out.

Philadelphia Wholesalers in Annual

The annual meeting and banquet of the Philadelphia Wholesale Lumber Dealers' Association came off at the Union League Club House on the evening of Jan. 9. Forty members and two guests, E. F. Perry, secretary of the National Wholesale Lumber Dealers' Association, New York, and Edward H. Coane of Philadelphia, were present. The banquet hall presented an attractive appearance with its lavish decoration of flowers and ferns, and the menu of the banquet suggested the famed Lucullus. A flashlight photograph was taken after all were seated.

Following the banquet, the meeting was opened by Horace A. Reeves, Jr., president, but nothing beyond the routine business and the election of officers came up.

Mr. Perry in a solicited speech touched upon the recent judgment of the United States circuit court in connection with the retailers' associations. He looks upon the verdict as given in a large measure to restrain the association from issuing or publishing a black list. Mr. Coane, a charter member of the association and now with the Pennsylvania Mutual Fire Insurance Company, in a short speech expressed himself as much surprised at the growth and advancement of the association—"the child had grown so big he hardly knew it."

There was no elaborate entertainment for the occasion, but in various groups much agreeable conversation was engaged in; pleasant reminiscences of the past year which had used them all well, and glittering prognostications as to what the year just entered upon held in store, furnishing the chief material. It was truly a social and good fellowship gathering and profoundly enjoyed it is declared by one and all.

New York State Forestry Association Meets

The Onondaga Hotel, Syracuse, N. Y., was the meeting place of the New York State Forestry Association, which met in annual session on Jan. 16. Following the address of welcome and a few introductory talks, Gifford Pinehot of Washington delivered a talk on "Forestry and the Nation," and Clifford R. Pettis, superintendent of forests of New York, talked on the subject of "The Administration of State Forests."

H. R. Bristol, superintendent of woodlands for the Delaware and Hudson Company, gave a talk on the subject of "Forest Mapping in New York."

Following a luncheon at the Chamber of Commerce, Frank L. Moore, president of the Empire States Forest Products Association, talked on "Forestry and the Lumberman." Other talks on branch associations, farmers interested in forestry, and the progress of forestry in New York were delivered at the afternoon session.

Meeting North Carolina Forestry Association

The North Carolina Forestry Association held its third annual convention at Raleigh, N. C., on Jan. 16. The meeting was well attended by prominent and interested people from all over the state, and many features having great bearing on the future forestry policy of the state were presented. Those in attendance represented the lumber trade, woodland owners, manufacturers of furniture and other lines of woodworking.

The program included addresses of welcome from the governor, the chairman of the County Board of Commissioners, the mayor of Raleigh and the president of the Raleigh Chamber of Commerce.

President E. B. Wright delivered the first address. His talk was followed by the appointment of committees, after which the reports of the secretary and treasurer were submitted. Reports from the executive and legislative committee were next in order, after which the Hon. Mark Porter, president of the Chicago, Cincinnati & Louisville Railroad and R. E. Rice, land and industrial agent of the Norfolk & Southern Railroad, talked on the "Railroads' Interest in Fire Prevention." Hon. R. R. Williams of Asheville, N. C., told about the proposed Mt. Mitchell state forest reserve.

Colonel S. H. Cohen, manager of the Greater Western North Carolina Association, spoke of "Forest Protection and the Development of Natural Resources."

The afternoon talks covered such subjects as "Observations on Forest Protection"; "The Lumberman and Forest Protection"; "Forestry Education"; "Furniture Manufacture and the Timber Supply"; "The County Fire Warden System"; "Chestnut Blight Investigation," and similar topics of special interest.

The evening session was taken up in an address by Henry Solon Graves on "Federal Aid in Fire Protection," and also reports of the various committees.

Meeting of the Memphis Lumbermen's Club

The principal features of the semi-monthly meeting of the Lumbermen's Club of Memphis, held at Hotel Gayoso January 18, were the decision to raise the dues of active members from \$10 to \$15, to adopt resolutions strongly favoring the appropriation of \$60,000,000 for the improvement of the Mississippi river in order that a recurrence of the disastrous flood damage of last year may be prevented, and the adoption also of resolutions asking the management of the Chisca Hotel to use red gum for the interior finish of the structure now being built here. The meeting was well attended. About fifty members were present.

The executive committee and the board of directors, at a meeting held a few days ago, recommended that certain changes be made in the constitution and by-laws with respect to the election of officers and also with respect to the holding of the annual banquet. This report was accepted and a committee consisting of George C. Ehemann, chairman, E. E. Taenzer, F. B. Robertson, J. W. McClure and F. E. Stonebraker, was appointed to investigate the proposed changes and report at a later meeting. The recommendation in regard to the banquet was that it might be held at any time, provided the necessary vote was recorded in favor of these and that it was made self sustaining. Each member is to be charged for himself and guest the exact cost of each plate.

The management of the Chisca Hotel has suggested that birch will be used for the interior, but the committee, of which W. B. Morgan is chairman, will use every endeavor to get the gentlemen who own this hotel to use red gum. This is due to the fact that it is felt that the use of gum in this structure will be a splendid advertisement for this wood. It is pointed out that the hotel owners of Memphis have profited largely by the patronage of the lumbermen and that they are under some obligations to them. The campaign in behalf of red gum has resulted in a wide expansion of the use to which this wood is put and the lumbermen here are anxious that this good work shall be continued.

The following new members were elected: Associate—J. N. Penrod and A. L. Jardon of the Penrod-Abbott Lumber Company, Kansas City; Joseph Thompson of the Dudley Lumber Company, Memphis; R. E. Dickinson, general manager of the Anchor Saw Mill Company, Memphis, and Palmer Kellogg, southern manager of the Christianson Lumber Company, Chicago.

One application for membership was received and approved. This application will be voted on at the next meeting.

Chicago Gets Next National Meeting

The board of directors of the National Hardwood Lumber Association met in Chicago, Jan. 15. There were sixteen members in attendance.

The secretary reported thirty-eight applications for membership received since the meeting of Oct. 24, 1912. This makes a total of eighty-eight new applications since the last convention. On motion these eighty-eight were admitted to membership. It was decided to hold the next annual meeting of the association in Chicago on June 5 and 6, it being the unanimous consent of the board that the Hotel Sherman should be selected as headquarters, owing to the excellent service given on the occasion of the 1912 convention.

J. W. Dickinson of Memphis was appointed to fill the vacancy in the board of directors created through the death of the late E. E. Goodlander of Memphis.

The report was received from the chairman of the inspection rules committee, which stated that the final report was not ready for distribution, but that the inspection rules committee of the National Hardwood Lumber Association had been in conference for three days with the grading rules committee representing the Northern Hemlock and Hardwood Manufacturers' Association and the Michigan Hardwood Manufacturers' Association. Chairman Pritchard reported a very harmonious meeting and stated that as soon as final recommendations of his committee could be drawn up, they would be given out to the membership through the office of the secretary.

The secretary submitted a report of the official inspections for the month of December, 1912. The total amount inspected under the bonded certificate during 1912 was 171,823,339 feet, an increase of 44,462,891 feet over 1911.

Hearing of the Proposed Increase of Rates to Canadian Points

The Interstate Commerce Commission will hold a hearing on the proposed increase of rates from southern to Canadian points, at the Federal building, Cincinnati, Jan. 24. This is a continuation of the meeting held recently at St. Louis, at which time the railroad side of the question was heard. This meeting was held for the purpose of hearing the lumbermen interested in preventing the increases. The Lumbermen's Club has retained G. M. Freer, traffic manager of the Chamber of Commerce, to represent Cincinnati interests at the hearing and many lumbermen will likely attend and testify if necessary. It is understood that lumbermen from St. Louis, Nashville, Memphis and other parts of the South affected by the increases will be on hand to protest against the new order going into effect.

National Wholesalers to Meet at Atlantic City

At the last meeting of the board of trustees of the National Wholesale Lumber Dealers' Association, the sentiment was very strongly in favor of an eastern city, with Atlantic City as first choice, for this year's meeting place of the association. As a result Lewis Dill of Baltimore, Md., and E. F. Perry, secretary of the association, were instructed to visit Atlantic City and make the best possible arrangements for the coming meeting. March being one of the pleasantest months in the year at Atlantic City, the committee considers itself very fortunate in being able to secure accommodations for Thursday and Friday, March 6 and 7. The headquarters of the meeting place will be at the Hotel Chelsea. Pleasant and satisfactory arrangements have been made in every respect.

Details as to the program, banquet, entertainment, invitations, etc., are left in the hands of a special banquet committee consisting of F. E. Parker, president, N. H. Walcott, G. C. Edwards, W. W. Knight, F. R. Balcock and Lewis Dill.

It is believed that the arrangements when completed will so largely meet with general approval that the association will have a larger attendance of members and guests than ever before.

News of the Hardwood Manufacturers' Association

President W. E. DeLaney of the Hardwood Manufacturers' Association of the United States states that the effort that is being put forth by the association to attract many consumers of lumber to the annual convention to be held here at the Hotel Sinton, Feb. 4 and 5, is meeting with much success. A great many of the members of the association are sending special invitations to their customers, urging them to attend this big gathering of lumber manufacturers, and, judging from the many acceptances, a large number of consumers will be present. It is not the object of the association to get these users of lumber here for the purpose of selling them stock, but for the purpose of having them participate in the discussions that will follow the reading of a number of valuable and interesting trade papers. The question of inspection of lumber, so important to the consumer as well as the manufacturer, is one of the main topics in which the consumer will be requested to take an active part, and the knowledge to be gained by attendance at these conferences makes the trip worth while. The entertainment feature of course will not be overlooked and the delegates who attend are assured of not only plenty of interesting and valuable business discussions but plenty of fun during the interim.

The official convention badge to be used at the meeting of the Hardwood Manufacturers' Association of the United States, which will take place in Cincinnati, O., on Feb. 4 and 5, has been issued by that association. The simplicity and beauty of design of the badge is particularly striking. The association has made it a rule that its crest shall always be used prominently on badges, letter heads, literature, etc., and this has been found a desirable rule, as it firmly establishes in the minds of the trade the crest and the institution which it represents.

The badges are the compliments of Henry Disston & Sons, saw manufacturers of Philadelphia. Instead of being numbered in the usual way, each person receiving a badge is provided with a slip of paper upon which the delegate's name will be printed with pen and ink.

Knoxville Lumbermen Form Organization

At a get-together banquet of the manufacturers and wholesalers of hardwood lumber held at the Hotel Imperial, Knoxville, Tenn., Jan. 22, plans were made for a permanent organization to promote a closer

connection among the hardwood fraternity of that city. D. M. Rose, who acted as toastmaster, was made the permanent chairman of the organization, and E. M. Vestal was chosen secretary and treasurer.

A good number of the local lumbermen were present at the banquet, and Lewis Doster, secretary of the Hardwood Manufacturers' Association of the United States, who was the guest of the meeting, was among the speakers of the evening.

The new association will next meet in the board of commerce rooms at three o'clock, Saturday afternoon, Feb. 15.

Two Philippine Woods

Two Philippine woods were recently shipped to the United States to be tried out for cabinet work. Forty thousand feet was lumbayo (*Tarrictia javanica*), a wood reddish brown in color, heavy, moderately hard, but said to be easy to work. Trees are of large size and abundant on some of the southern islands. Eight thousand feet of tanguile (*Shorea polysperma*) constituted the other shipment. This wood is also reddish brown, moderately hard, and is cut from large trees. It is said that a strong endeavor will be made to popularize these woods in the United States.

The Hardwoods of New South Wales

A talk on the hardwood timbers of New South Wales as delivered by W. H. Warren, L.L.D., of the University of Sydney, before the Society of Art at London was recently published in the Timber Trades Journal of that city. The article says:

"Over the greater part of the vast area comprised in the Continent of Australia forests are more or less distributed, which consist of trees yielding strong and durable timber. These, for the most part, are of the eucalyptus species, as well as some others, and are generally known as hardwoods.

"The average height to which eucalyptus attain in New South Wales is about one hundred feet, with a stem of from two feet to four feet in diameter. In jungle forests they have been known to reach a height of two hundred feet, and one hundred and fifty feet is not an uncommon height for more than one species to attain. But these heights sink into insignificance when compared with those of some allied species indigenous to Victoria, Tasmania and Western Australia. The Tasmanian blue gum (*Eucalyptus globulus*) reaches a height of three hundred feet, and the late Baron von Mueller states, in his official record of trees, that a karri-tree (*Eucalyptus diversicolor*) of Western Australia, and also a fallen tree in the deep recesses of the Dandenong, Victoria, gave a length of three hundred feet, with a stem of proportionate diameter. I have seen trees in the Black Spur Range, Victoria, not far from the main road, which approximate closely to three hundred feet in height.

"The best time to cut down trees is after they have fulfilled their natural functions of leafing, flowering, and maturing their fruit, not when they are in full vigour of growth.

The durability of the timber derived from some of the trees is best realized by considering the experience of the Public Works Department in New South Wales, which gives the average life of timber bridges as twenty-five years, excepting the timber decks, which, in consequence of the wear caused by the traffic, last about twelve years.

"Until recently sufficient attention has not been given to the proper time of felling, and very little has been done in the direction of seasoning, so that the durability is not as great as would be possible if these matters were more carefully attended to. I have seen perfectly sound timber taken from old bridges, or piles in damp ground, which have been in use for periods varying from forty to sixty years. The strength and durability of timber depends to a great extent upon the locality in which the trees are grown. Timber, for example, of the same name and presenting the same general characteristics, but grown under different conditions in regard to temperature, geological formation of soil, the amount and the distribution of rainfall, whether grown on mountain ridges or in swampy, low-lying ground, differs widely in quality. Granite country does not appear to produce good timber in any part of Australia. Hardwood timber grown in swampy low-lying ground is generally defective in tenacity of fibre compared with the same timber grown at higher elevations, and where the geological formation is favorable. The chief objections to the use of timber in constructive work are its liability to decay from dry-rot, to the attacks of the white ant, and in marine work to the attacks of the teredo."

It is not to be inferred from the above article that it is in any way a recommendation of the soundness of the claims of the eucalyptus promoters in California. The condition prevailing in Australia is absolutely different in every way. Australia is the natural place of growth for the eucalyptus and timber referred to is not artificially grown, but is the virgin stand growing in its natural environment. We are not conversant with the exact physical qualities of the Australian eucalyptus but it is probably true that it can be used for such rough purposes as bridge timbers, poles, ties, etc.

Biltmore Doings for December

Dr. C. A. Schenck and the students of the Biltmore Forest School are enjoying an instructive trip through the German forests. On Dec. 4 the school left Darmstadt for a three weeks' trip into the forests of northern Bavaria, Saxony and Prussia. One of the points visited by the

students on this trip was the Frankenwald, located at the extreme northern edge of Bavaria. This has been the scene of logging operations since 1516. The logs were at that time rafted down the Main and Rhine rivers to Holland. In the early part of the nineteenth century, the district suffered from a great windfall. Immediately logging on a large scale was imperative and to this end a large number of small mills were brought into the district. To the present day these small mills are operating along the rivers and the government supplies them with logs at a price fifteen per cent below that which they would fetch in the open market. At the present time the logs are driven down the numerous small streams by the help of splash dams maintained by the government. During the last twenty years but one fire has occurred in this district and it burned over but three acres. Here is shown an excellent example of the close application of modern forestry. The annual cut is about equal to the annual increment, namely about seven hundred feet per acre per year. The price of good stumpage is from \$17 to \$30, while twenty years ago it was only \$7.50 a thousand feet.

On Dec. 9 the school arrived at the Academy of Tharandt, the "Mecca" of foresters. The academy was founded in 1810 by the greatest of all foresters, Heinrich von Cotta, as a private school, but was later taken over by the Kingdom of Saxony. At this school can be found more information regarding forest finance and its practical application to the forest than at any other place. During the stay at Tharandt the students were privileged to attend special lectures delivered by some of the most prominent men in forestry circles. During one of these lectures,—that given by Professor Wislicenus, it developed that he had been able to produce artificially from minerals perfect fibre having the characteristics of real wood fibre.

The students were also told of a method of surveying by the use of a camera whereby, instead of reading the angles by eye with the aid of a transit, the work is done with a specially constructed camera.

One of the last trips made in the month of December was to Eberswalde, near Berlin, where the largest and best equipped forest school in the world is located. The students were here privileged to hear lectures by Professor Schubert on meteorology, which explain the effects of forests on rainfall, temperature and humidity.

The school will return to the United States on the steamer New Amsterdam, sailing Mar. 15, 1913.

Liverpool Concern Expands

Gilbert Y. Tickle of Tickle, Bell & Co., 523 Royal Liver building, Liverpool, announces that he has taken into co-partnership his son, Ernest W. Tickle. The company will continue in business as mahogany and fancy wood brokers under the old firm style. The company has been in business for the last eleven years and is recognized as one of the foremost of the Liverpool lumber merchants.

Bird's-Eye Veneer Company Organized in Escanaba

The Bird's-Eye Veneer Company is the style of a new concern recently incorporated under the laws of Michigan, and organized to do business in the manufacture of veneers at North Escanaba, Mich. The company started the erection of its new plant on December 23, the site being near that of the National Pole Company's plant.

The corporation is capitalized at \$60,000 and has the following officers: J. C. Kirkpatrick, president; C. T. Tuxford, vice-president; C. C. Patterson, secretary and treasurer. The company is made up of practical lumbermen and will specialize in bird's-eye maple veneer. The business will be in direct charge of Mr. Tuxford as general manager. Mr. Tuxford is a veneer producer of twenty-four years' experience, who located at Escanaba four years ago, having been since then in charge of the Escanaba Veneer Company's plant.

While the company will specialize in bird's-eye maple of fine quality for furniture and interior finish, it will also work up birch, plain maple and basswood. Mr. Tuxford has already made contracts for a supply of logs for the coming season.

The buildings being erected consist of the main structure, 100x360 feet, and the wing, 40x237 feet, which will be two-stories high. The boiler house will be 40x90 feet. The plant also includes boiling vats and other necessary features. Work will begin with two machines, but it is expected that the equipment will be increased rapidly. Provision has been made in the plans for large additions to the works.

The Chicago & Northwestern Railroad is connected with the mills by switch, and the Escanaba & Lake Superior Railroad is now installing a switch to connect with its tracks. It is expected that the plant will be ready for operation about the first of April.

Lancewoods of Commerce

The true lancewood of South America is a slender tree, found in tolerable abundance in the interior of British Guiana. It grows from four to six inches in diameter at the lower end, and from fifteen to twenty feet high. It was originally referred by Schomburgk to *Inuetia quitarensis* Lind. Robert Thomson, who was at one time superintendent of the Government Botanic Gardens, Jamaica, called it *Oxyandra virgata*—*Guatteria virgata* Dun. This tree had been previously described, however, by Benthall and Hooker, who referred it to the genus *Borayea*. In French Guiana the tree is known as jejevecou, and by their botanist is referred to as *Xylophia*. The native name of the wood is yari-yari. In Trinidad the lancewood is said to be produced by *Rollinia sieberi* Dec., and the average

diameter of the trunk of a full grown tree is one foot. There would appear to be two varieties of lancewoods in British Guiana. The carisir, swamp, or black lancewood, attains to a height of fifty feet, and is seldom more than four to eight inches in diameter. It is remarkable for growing with but little taper. It is in great repute, being superior to the closely allied yari-yari, arara, or yellow lancewood, which is somewhat smaller and grows in the hills.

The true lancewood (*Bocagea virgata* B. & H.) also grows in Jamaica, where it is called black lancewood. It forms an erect tree attaining a height of thirty feet, with a diameter of from nine to twelve inches, and is found in the woods of the central and western parishes. The wood possesses great elasticity, and on that account is exported for making carriage shafts, lances, spars, fishing rods, ramrods, and general turnery.

The white lancewood (*Bocagea laurifolia* B. & H.) occurs in Jamaica and other islands of the West Indies. This tree grows to a height of fifty feet or over, with a trunk diameter of from twelve to eighteen inches or more. It is used to some extent but is not nearly so valuable as black lancewood.

Tenasserim lancewood is said to belong to the dogbaue family of plants, and is therefore entirely unrelated to the true lancewood (*Bocagea virgata*) of commerce. It is a tree which produces a timber possessing the properties of the genuine kind and is quite common in the Tenasserim provinces. It is used for bows, spears, chisel-handles, etc. It is tough, hard, elastic, and very durable, capable of a beautiful polish, and makes excellent furniture. The direct rays of the sun badly fade and check the wood.

Lancewood would be preferable to hickory for shafts commonly used by American carriage builders, but it is difficult to obtain and very expensive. For wooden side bars, now so popular in connection with light road wagons, lancewood would doubtless prove the best for this purpose, and come into general use, were it not for its expense, and the difficulty of obtaining it in sufficient quantities, for it possesses those qualities particularly demanded for side-bars, namely, stiffness, toughness, and elasticity. The wood is used for gig shafts, archery bows, billiard cues, and, when small, for whip handles and fishing rods. The Indians make their arrow points of it.

The value of imports of lancewood into the United States from 1900 to 1910 inclusive is as follows:

1900.....	\$1,933.00	1905.....	\$ 535.00
1901.....	343.00	1906.....	811.00
1902.....	1,129.00	1907.....	1,616.00
1903.....	4,087.00	1908.....	1,545.00
1904.....	4,151.00	1909.....	691.00
1910.....		1910.....	\$3,077.00

Substitute for Lignum-Vitæ

The scarcity and high cost of lignum-vitæ bar it from a number of places which it is well fitted to fill. The principal supply comes from the West Indies. It is very hard, and one of its most common uses is as gudgeons and bearings of wheels that turn slowly. Bulletin 9 of the Philippine Bureau of Forestry was recently issued from the Bureau of Printing at Manila, for the purpose of acquainting the public with a Philippine wood which it is claimed is a satisfactory substitute for lignum-vitæ. It is known as mancono (*Xanthostemon verdugonianus*). Its air-dry weight is from eighty to ninety pounds per cubic foot. The wood is fairly plentiful, the quantity in sight being between five and six million cubic feet. It is rated as the hardest and heaviest of Philippine woods. The Bureau of Forestry at Manila announces that it will send samples free to interested parties on request. The bulletin was prepared by I. W. I. Hutchinson, forester.

Sugar From Wood

It is claimed that a process has been perfected in England for making sugar from wood. According to accounts, sawdust is treated in closed retorts with a weak sulphurous acid solution and the resulting product contains about twenty-five per cent of sugar. It is useful as a feed stuff and as a material for the manufacture of spirit. A factory capable of treating 200 tons of sawdust per week could turn out between 300,000 and 400,000 gallons of proof spirit per annum, besides other valuable by-products. There is no account of the effect on live stock which eats this wood sugar. It might be well enough to let the English try it on their horses and cattle first.

Making Wooden Combs in the Philippines

Thousands of wooden combs are made annually in the Philippine Islands and are a staple article on the market. The best grade is made out of the hard, heavy, fine-textured and very dark heartwood of "Philippine ebony" or *camogon* (*Diospyros discolor*); the cheaper ones from the grayish or reddish sapwood of the same species. Most of the combs are worn by native women. The process of making is very simple. The green wood is sawed into sections of convenient length and then split into thin tangential slabs. The latter are dried over a smoldering fire of sawdust held in an earthen vessel. The outline of the comb, usually curved at the back, is drawn in pencil on the slab, which is then clamped in a vice for sawing. The teeth are sawed out first and afterward the back of the comb is cut away. Polishing is done with sandpaper or rough leaves. While most of the combs are plain some are curved or engraved, the instruments used for the purpose being a sharp, pointed knife, a small graver's tool, or even a section of umbrella rib brought to a point.

Diseased City Trees to be Investigated

The State College of Forestry at Syracuse, N. Y., has taken up the work of investigating the causes which produce disease and death of city and park trees, and it will probably extend its investigation to forests. Planted trees in parks and along streets have some advantages over their wild kindred in the native woods, but there are disadvantages also. Fungus and insects attack the trees with increased persistence, and smoke, escaping gas and dust, which are generally wanting in the forest, often lower a city tree's vitality, or destroy it entirely. The first step with investigation will consist in discovering the causes of tree diseases, and the second step will seek a remedy.

F. A. Diggins Improving After a Serious Illness

Fred A. Diggins of Murphy & Diggins and the Cummer-Diggins Company, Cadillac, Mich., and ex-president of the National Hardwood Lumber Association, has been confined to his bed in a serious condition. In fact at one time his condition was so serious that it was feared he would not survive until morning. A letter from J. C. Knox, of Cadillac, advises, however, that Mr. Diggins' condition is materially improved. The trouble resulted from an attack of grippe, which developed into pneumonia and later affected his heart. The latter condition was the grave cause for anxiety. Mr. Diggins has been about as close to the border line as a human being usually goes and comes safely back. While he is not entirely out of danger, his condition is improving every day and it is anticipated that he will soon be in his usual place of business.

Penrod-Jurden-McCowan Lumber Company Organized

The Penrod-Jurden-McCowan Lumber Company is the style of a new incorporation which has been organized at Kansas City, Mo. The company has a paid up cash capital of \$155,000 and is equipped with mills at Brasfield, Ark. The officers of the company are J. N. Penrod, president; H. A. McCowan, Salem, Ind., vice-president; R. L. Jurden, secretary, treasurer and general manager. R. H. Brown of Brasfield is resident manager.

The company succeeds the affairs of the Penrod-Abbott Lumber Company at Brasfield, which concern was operated as a co-partnership, but at the death of Frank P. Abbott of Goshen, Ind., it became necessary to incorporate the business. The company owns large tracts of hardwood stumpage, principally gum and oak, on the Cache river.

It is estimated that the timber resources are adequate for ten years' run. The plant is equipped with a nine-foot bandsaw and resaw, and is cutting about 45,000 feet, log scale, per day. The general office will as heretofore be maintained at Kansas City.

Acquires Land For Forestry Demonstration

The New York State School of Forestry of the Syracuse University, Syracuse, N. Y., has just acquired a gift of an interesting tract of timber for use as a forest experiment station. The tract includes one hundred acres of forest in the Catskills near Tannersville, N. Y. This is the second gift to the college within a year, the first having been a tract of eighteen hundred acres of cutover lands in the neighborhood of the school. In the spring the college will put a forester onto the tract and will maintain there for all time a research station. It will be used for educational purposes by the various classes of the college, and have a camp there during the summer.

A Valuable Book

Albert C. Righter, who for several years has been secretary of the Retail Lumber Dealers' Association of Pennsylvania, is the author of a new book, "Some Fallacies of our National Government." The book contains twenty-five chapters and among the more suggestive topics treated in them are the following: "The Trust Question," "Yellow Journalism," "The Great Curse," "The Forgotten Millions," "The Remedy and Victory" and "What Would Lincoln Do?" The book contains many personal experiences of the author. It takes up in considerable detail the troubles of the retail lumber dealers in this country, especially in connection with the recent investigation of the so-called lumber trust. The work is well illustrated throughout and contains many suggestive ideas along the leading social and economic questions of the day.

The Lumber Law Review

The Lumber Law Review for December, 1912, was recently issued from the offices of the National Lumber Manufacturers' Credit Corporation. The bulletin contains the usual quota of information valuable to the lumberman in connection with his business, particularly as far as the legal phases are concerned. The feature of the bulletin is the summary of the status of the right of stoppage in transit, which is of so much importance to and so little understood by the average lumberman. Other cases coming in for a discussion cover the question of place and time of delivery involving rejection by buyer; the remedy of buyer in connection with breach of contract; action for breach of contract where goods are left in the custody of sellers; breach of contract by seller involving measure of damages; remedy of seller involving action for breach of contract and re-sale.

Shipbuilding and Shipping for 1912

The annual report of the Bureau of Navigation of the United States Department of Commerce and Labor shows that there was an increase of 135 in the number of vessels of all classes constructed in the United States during the year 1912. There was, however, a notable decrease in total tonnage.

During the year there were constructed in the United States 1,272 vessels, with a total tonnage of 292,477 tons. The figures for 1911 show that 1,592 vessels were constructed, totaling 309,640 tons. The steam vessels of steel construction showed a decrease in 1912 over 1911, while steam vessels of wooden construction showed an increase.

From British sources official reports are published which confirm the prediction for the year 1912 that it would be the most disastrous for shipping since marine insurance began, nearly two-and-a-half centuries ago. The known losses aggregate \$35,000,000, and it is believed that when the undetermined claims are made, the loss will reach \$40,000,000. This includes casualties to vessels not exceeding 500 tons, which numbered 6,061.

Leases Cincinnati Yard

The Johns-Mowbray-Nelson Company, wholesaler of hardwood lumber, with offices in the Provident Bank building, Cincinnati, O., has leased yard space from the Chesapeake & Ohio Railroad. The location of the yard will be at the corner of Eighth and Horn streets, Cincinnati, at the lower end of the McLean avenue lumber district. It is expected that it will afford room for piling five million feet of lumber.

The Chesapeake & Ohio Railroad will install a private switch for shipping. R. W. Lucius, southern manager for the company will be placed in charge of the yard office.

This step is a further demonstration of the fact that the Johns-Mowbray-Nelson Company is growing and growing fast.

National Inspection for December

The inspection bureau of the National Hardwood Lumber Association has issued a statement of inspection for the month of December, 1912, through President Charles H. Barnaby and Secretary F. F. Fish. The report shows a total of 15,890,954 feet of hardwood lumber inspected under the bonded certificate of the association for the month. This is an increase of 5,275,753 feet over December, 1911. During the year 1912 the increase in inspection work exceeded all previous records.

The statement of inspection by months follows:

	Feet
January, 1912.....	9,780,831
February.....	9,194,333
March.....	9,045,383
April.....	11,213,270
May.....	12,187,874
June.....	13,249,177
July.....	15,909,500
August.....	18,041,552
September.....	20,639,850
October.....	19,489,975
November.....	17,180,640
December.....	15,890,954

Total for 1912.....171,823,339

The total amount inspected during the year 1911 was 126,360,448 feet. Thus the gain in inspections for the year 1912 over 1911 was 44,462,891 feet.

The books of the inspection bureau show that the bureau was operated at a loss seven months of the year, and at a profit five months of the year. The net result of the operation was a cost to the association of \$807.75 in excess of the earnings of the inspectors. The figures take into account the salaries and expenses of all inspectors, including the chief inspector, as against the fees and necessary expenses charged members for the service.

A Sixtieth Wedding Anniversary

In the Pasadena, Cal., Star of Friday, January 3, 1913, an article was given of the sixtieth wedding anniversary of Mr. and Mrs. L. V. Boyle, the celebration taking place at their attractive home. Mr. and Mrs. Boyle are approaching the eighty-fourth milestone along life's way, and they received numerous letters, telegrams and presents, with a number of callers. In the evening there was a charmingly appointed dinner party. An informal reception was held after the dinner and the hosts were presented with a handsome cake with sixty candles from the members of the Westminster Presbyterian church. Numerous other gifts were also received. The house was decorated with crimson carnations, Christmas bells and greenery, with an especially pretty arrangement for the table. Covers were laid for sixteen and among them were Mr. Boyle's sons and daughters now residing in California. Mr. and Mrs. Boyle were married sixty years ago in Indiana, and for a great many years Mr. Boyle was a prominent lumberman in the hardwood trade. He operated in walnut for a number of years in Indianapolis and later on operated at O'Brien, Tenn., and Boyle, Miss. He moved to California about twenty years ago. Since that time he has been living in Escondido and at Pasadena. The only absentee from the wedding was his son Clarence Boyle, who is connected with D. K. Jeffris & Co., Chicago. Mr. and Mrs. Boyle are in excellent health, enjoy life, and have promise of many more years of happiness.

Change in Philadelphia House

Jerome H. Sheip, Incorporated, was chartered under Pennsylvania laws Jan. 4, 1913. It is capitalized at \$150,000 and has as its officers: President, Jerome H. Sheip; first vice-president, H. S. Best; second vice-president, S. S. Koller; secretary, Stanley S. Sheip; treasurer, W. H. Ramsey. The company takes over the whole business heretofore carried on by J. H. Sheip, composed of the cigar box lumber plant at Choctaw Point, Mobile, Ala., and his wholesale lumber business in Philadelphia.

Jerome H. Sheip, for many years of Sheip & Vandegriff, and the Philadelphia Veneer and Lumber Company, is one of the best known and liked men in the business; a man who has made a study of the cigar box lumber for many years, and his reputation in the trade for honest dealing and all time reliability has made him one of the most respected of business men.

H. S. Best, a practical lumberman, came from Williamsport, Pa., a few years ago, where he was employed as superintendent by the Central Pennsylvania Lumber Company, and associated himself with the Sheip concern, becoming manager of the Mobile plant. He is reputed one of the best hardwood manufacturers in the country.

Stanley S. Sheip, son of the president, after his graduation from Harvard College, a few years ago, adopted the business of his father, which he has learned from the ground up. He is now secretary of the new company, with headquarters at Mobile.

JEROME H. SHEIP, PRESIDENT JEROME H. SHEIP, INC., PHILADELPHIA, PA.

H. S. BEST, FIRST VICE-PRESIDENT JEROME H. SHEIP, INC., PHILADELPHIA, PA.

STANLEY S. SHEIP, SECRETARY JEROME H. SHEIP, INC., PHILADELPHIA, PA.

Hardwood News Notes

< MISCELLANEOUS >

B. J. Goodman of Forsyth, Mich., has incorporated his business at \$75,000 and will operate under the style of the B. J. Goodman Lumber Company.

The Grand Rapids Molding Company has been succeeded by the Klise Manufacturing Company, incorporated at Grand Rapids, Mich., with a capital of \$25,000.

The Sharum-Benningfield Lumber Company is the name of a new concern incorporated at Hoxie, Ark., for \$25,000.

The Modern Cabinet Company is the style of a recently incorporated Indianapolis concern which is capitalized at \$35,000.

The Fox & Mason Furniture Company of Corunna, Mich., has increased its capital stock to \$300,000.

The Public Cedar Company has been incorporated at Escanaba, Mich., at \$10,000.

The Hillsdale Lumber & Coal Company of Hillsdale, Mich., has increased its capital to \$17,000.

M. H. Hand of Plymouth, Wis., has incorporated his business under the name of the M. H. Hand Lumber Company.

The Hale-Mylrea Lumber Company has been organized at Wausau, Wis., with an authorized capital of \$12,000.

The Moline Plow Company of Moline, Ill., has increased its capital stock from \$9,000,000 to \$30,000,000.

The Peoria Casket Company has been incorporated under that style at Peoria, Ill., having capital of \$100,000.

The Bockstege Furniture Company of Evansville, Ind., has increased its capital from \$60,000 to \$120,000.

Fire recently caused \$25,000 loss to the Saginaw Basket & Veneer Company, Saginaw, Mich. The plant was insured.

The Indiana Hardwood Flooring Company has been incorporated at Indianapolis with a capital stock of \$5,000.

The Texas Hardwood Lumber Company was recently incorporated at Warren, Ark., at \$75,000 to manufacture hardwood lumber.

The Hoskins Lumber Company, operating saw and planing mills at Mt. Gilead, O., has been incorporated at \$10,000, by M. M. Hoskins, Morris W. Kline, Ethel Eder and J. W. Barr.

The Wells-Davis Manufacturing Company has been incorporated at Richmond, Va., by J. W. Jefferies of Middlethian, Va.; R. H. Bruce and R. B. Davis, Chester, Va. The company will engage in the lumber business.

The Wheelley Spoke Company has been organized at Wheelley, Ark., with an authorized capital of \$10,000.

A recent New Jersey incorporation is the Newark Toy & Novelty Manufacturing Company, which will operate at Newark, with an authorized capital of \$50,000.

The Midland Manufacturing Company will operate at LaPorte, Ind., with a capital of \$25,000.

A new furniture manufacturing company is the Commonwealth Manufacturing Company, Gardner, Mass., capitalized at \$150,000.

The North Arkansas Tie & Timber Company has been incorporated at Leslie, Ark., with a capital of \$200,000.

The Rust Manufacturing Company recently begun business at Lomax, Ill., and will manufacture ironing boards and stepladders.

At Kansas City, Mo., the Kansas City Flooring Company has increased its capital stock from \$50,000 to \$100,000.

The Manhattan Grill Company is the style of a new concern which has started operations in New York City for the purpose of manufacturing grill work. The company has \$10,000 capital.

The Williams Fulgham Lumber Company is the style of a new incorporation at Asheville, N. C. This company has \$25,000 capital stock.

The new hardwood mill of the Howell Brothers Company of Junction City, Ark., started cutting on the first of the year. This mill replaces one destroyed by fire about three months ago. The plant is equipped with two circular saws and a resaw, and has a capacity of 65,000 feet per day. H. T. Howell is president of the company.

The Arkansas Short Leaf Lumber Company of Pine Bluff, Ark., will shortly begin the erection of a hardwood mill, which it will operate in connection with its pine mill at Pine Bluff. A separate company will be organized to operate the hardwood plant, which will have a capacity of 60,000 feet per day. An oak flooring mill will also be established in connection with the hardwood plant.

The Giles Brothers Hardwood Company is the style of a new concern which will shortly complete the construction of a hardwood sawmill at Forest Hill, La. The mill will have a capacity of 35,000 feet per day. The machinery is already being installed.

Commissioner P. K. Lane of California was elected on Jan. 8 to succeed Commissioner Charles A. Prouty as chairman of the Interstate Commerce Commission for the year beginning January, 1913. Mr. Lane has been a commissioner since 1905.

The C. K. Kyles Veneer Company is the style of a new concern that has been organized at Mobile, Ala., to manufacture and deal in wood products. The company has a capital stock of \$10,000. Its officers are C. H. Kyles of Mobile, president; N. G. Harding of Chicago, vice-president, and A. L. Kridler, of Mobile, secretary and treasurer.

The Baskin Lumber Company of Baskin, La., has purchased 22,000 acres of hardwood timber near Baskin from John W. Kesterson. It is expected that the Baskin company will begin cutting its timber immediately.

The Kendall Lumber Company of Pittsburgh will in the spring begin exploiting the tract of timber known as the "Chess" tract near Morgantown, W. Va. Plans have been completed for the installation of necessary equipment, and a new railroad will be built up Cheat river by the Kendall company. This will be completed by spring. Timber operations will begin about April 1.

The Chicago Mill & Lumber Company has purchased 12,000 acres of timber in Phillips county, Arkansas, which it is estimated will yield 60,000,000 feet of hardwoods. A sawmill will be erected for manufacturing the timber, which runs principally to oak, ash, hickory and gum.

A concession of timberlands containing approximately 60,000 acres was granted by the Bureau of Forestry at Manila. The concession is a twenty-year exclusive license agreement. The Manila Sawmill Company was the successful bidder for the privilege. Acting Director of Forestry W. F. Sherfesse has announced the granting of the new timber concession in the Philippines, which under certain conditions will involve a capital investment of not less than \$550,000. This tract borders on Ragay Gulf. It was advertised for competitive bids several months ago, and the grant was finally made to E. J. Lane, who has associated with him in the enterprise capitalists and timber operators in British Columbia and northwestern United States.

The Hamilton Ridge Lumber Corporation is the style of a new company which will operate at Richmond, Va., with a capital of \$50,000 to \$100,000. The officers are J. R. Paschall, president; C. Boice, vice-president; James Mullen, secretary; Thomas Gresham, treasurer, all of Richmond.

The Park Falls Manufacturing Company's veneer and sawmill at Park Falls, Wis., had operated only a few days after having been closed down for repairs when the plant was totally destroyed by fire of unknown origin. The loss is estimated at \$50,000, with insurance to the extent of \$26,000. It is reported that the plant will be rebuilt as soon as possible and that the fire will not interfere with log buying.

The new factory at Munising, Mich., styled the Munising Veneer Company, is now employing more than fifty men and has orders enough ahead to keep the plant at full capacity for some time. At present the chief products are door stock, automobile dash boards and piano pin blocks. Birch and hard maple are the principal woods used. The officers of the new company are: Wm. G. Mather, president, Cleveland; William Chandler, vice-president, Sault Ste. Marie; Sherman T. Handy, secretary, Sault Ste. Marie; A. R. Dow, treasurer; G. A. Whitmeyer, general manager, Munising. Mr. Whitmeyer formerly managed several fine veneer plants in New York state.

< CHICAGO >

It is announced that the Chicago office of the Forest Service, United States Department of Agriculture, will be moved from the Fisher building to the Federal building, on Jan. 31.

H. B. Darlington, vicegerent snark of the Northern District of Illinois of Hoo-Hoo, has sent out invitations to the members of that branch of the organization to attend the concatenation to be held at the Hotel Sherman, Chicago, Tuesday evening, Feb. 12, at 9:09.

G. C. Cremer, president of the Cremer Lumber Company of St. Louis and Crossett, Ark., has been in the city several days completing arrangements for starting his immense new hardwood operations at Crossett, Ark. The new company has one of the finest and largest hardwood plants in the country and is amply provided with hardwood stumpage and capital. It is expected the company will have lumber for shipment in May.

H. H. Barclay, formerly Rochester manager of the Wood-Mosaic Company of New Albany, Ind., now manager of the Standard Mills, Ltd., which is located about sixty-five miles north of Montreal, called at HARDWOOD RECORD'S offices Jan. 17. Mr. Barclay's new concern manufactures birch and maple flooring.

T. M. Brown of the W. P. Brown & Sons Lumber Company, Louisville, spent a few days last week in Chicago in attendance at the meeting of the directors of the National Hardwood Lumber Association.

R. S. Kollogg, secretary of the Northern Hemlock and Hardwood Manufacturers' Association, Wausau, was in Chicago on Jan. 14.

J. L. Benas, vice-president of the Waldstein Lumber Company, St. Louis, spent several days of last week in the city.

H. E. Below of the Vollmar & Below Company, Marshfield, Wis., spent most of last week in Chicago on business.

M. L. Pease of the Galloway-Pease Company, Saginaw, Mich., and Poplar Bluff, Mo., made one of his regular selling trips to the local market the early part of last week.

A new company recently organized at Chicago is the Chicago Maple and Oak Flooring Company, with a capital of \$100,000. The incorporators are John J. Nichols, Vernon E. Nichols, John M. Nichols.

J. T. Edwards, president and sales manager of the Medford Veneer Company, Medford, Wis., was in the city last week in conference with his local representative, the Hardwood Mills Lumber Company.

Gardner I. Jones of the Jones Hardwood Company, Boston, Mass., called at HARDWOOD RECORD offices on Jan. 15. Mr. Jones was in the city in attendance at the meeting of the directors of the National Hardwood Lumber Association.

Dr. C. A. Schenck, director of the Biltmore Forest School, and head of C. A. Schenck & Co., timber experts and cruisers at Biltmore, N. C., has just issued a pamphlet describing the character of work done by that concern. The pamphlet is a decided work of art in every way and, contrary to the usual literature gotten out by concerns of this character, it is an excellent exposition of the possibilities of modern advertisement writing. It should certainly be secured by any individual or company contemplating cruising work of any character.

"Practical Country Buildings" is the title of a booklet gotten out by R. S. Kellogg, secretary of the Northern Hemlock and Hardwood Manufacturers' Association of Wausau, Wis. The book is a handbook of economical and common-sense plans and details for the construction of dwellings, barns, stock and implement sheds, ice houses and all types of farm construction. It is compiled by Wm. A. Radford, president of the Radford Architectural Company. Mr. Radford is also editor-in-chief of the American Carpenter and Builder, the Cement Works and other publications equally well known in building and architectural circles, and the author of many standard books pertaining to the building industry. The book is issued by the association as a follow-up in the advertising campaign on hemlock. Five thousand copies are being sent to farmers who answer the ads and to retail lumber dealers in the territory to which hemlock is chiefly shipped.

At the sixteenth annual of the Southern Illinois Retail Lumber Dealers' Association at Alton, Ill., Hoo-Hoo will hold a concatenation. The dates of the convention are Jan. 29 and 30, and the concatenation will come on Jan. 30.

G. H. Holloway of the Holloway Hardwood Lumber Company, Great Northern building, Chicago, just returned from a two weeks' trip to Arkansas and Tennessee mill plants. Mr. Holloway reports that while in some cases food conditions have made shipping difficult, he encountered little trouble from this cause.

The proceedings of the forest fire conference of the Western Forestry and Conservation Association as held in Portland, Wash., Dec. 2 and 3, have been compiled in pamphlet form, copy of which has been received at HARDWOOD RECORD offices.

W. M. Stevenson, Supreme Scrivener of the Hoo-Hoo, has been in Chicago for several days.

E. C. Mershon of Saginaw, Mich., called at HARDWOOD RECORD offices on Jan. 22. Mr. Mershon was in the city for the day only, being en route to the Pacific coast, where he will meet his wife.

R. H. Darnell, associated with R. J. Darnell of Memphis, Tenn., was in town on business Jan. 22.

J. W. Wyatt of Memphis, Tenn., was one of the southern visitors to the city during the past week.

W. H. Schleyer of the Kosse, Shoe & Schleyer Company, Cincinnati, O., spent a couple of days in the past week with the local trade.

J. Downs of Downs Brothers, hardwood sawmill operators with headquarters at Rochester, Ind., left for home on Wednesday of this week after having made a business trip of several days' duration in the city.

The William Lorimer Lumber Company has been incorporated under the laws of Illinois to do a wholesale lumber business in Chicago with a capital of \$200,000.

The Fink-Heidler Company of Chicago has increased its capital stock from \$25,000 to \$50,000.

J. I. Nichols of the Nichols & Cox Lumber Company, Grand Rapids, Mich., spent several days of this week in the city.

← NEW YORK →

W. G. Donald is the new manager of the New York office of the Simonds Manufacturing Company with headquarters at 40 Murray street, Manhattan. He succeeds the late L. A. Kimball, who had been in charge of the local office for a great many years. Mr. Donald has been with the Simonds Manufacturing Company for some time and formerly traveled in one of the Middle State territories. He is an experienced saw and knife man and the Simonds' customers will find him possessed of a fund of useful saw knowledge.

S. E. Slaymaker of S. E. Slaymaker & Co., hardwood wholesalers, 200 Fifth avenue, is planning to leave for Pinehurst and Palm Beach on a pleasure trip. R. U. Shaeffer of the Slaymaker forces has been ill with typhoid, but is now convalescing.

E. M. Stone of the Travis Lumber Company, Huntsville, Tenn., was a recent visitor in New York. His company is operating in hardwoods and making a specialty of yellow poplar and oak.

Frank P. McNulty, Incorporated, 2 East Forty-second street, for some time identified with the local wholesale hardwood trade, is in liquidation.

The National Wholesale Lumber Dealers' Association will hold its annual convention at Atlantic City, N. J., March 6 and 7, according to announcement from headquarters last week. The Hotel Chelsea has been selected for the meeting place and headquarters of the association.

J. E. Rhodes, secretary manager of the National Lumber Manufacturers' Association, headquarters Chicago, Ill., who is on an eastern trip in the interest of association matters, spent several days in town recently.

← BUFFALO →

The Chamber of Commerce associates of O. E. Yeager gave him a dinner on Jan. 14, on which occasion he was presented with a gold watch. The dinner marked Mr. Yeager's retirement as president of the chamber and the diners numbered about seventy-five. Many tributes were paid to Mr. Yeager's activity as president, to which he responded, showing his appreciation of the good will shown.

A committee representing the Automobile Club of Buffalo appeared before Gov. Sulzer on Jan. 16 to urge upon him the reorganization of the state highway department. The committee was headed by the newly-elected president, M. M. Wall. The permanent placing of highway improvement in the hands of efficient engineers, rather than politicians, was advocated.

President W. L. Sykes of the Emporium Lumber Company was in Washington recently, where he attended the convention of the American Forestry Association. He is also taking a part in the organization of the New York State Forestry Association, which has just been organized, a meeting for the purpose having been held at Syracuse on Jan. 16.

The Ideal Furniture Company, East Jamestown, suffered a loss of several thousand dollars on Jan. 14 by fire, caused by spontaneous combustion.

Seatherd & Son report the New York building and door situation very active. The reason they are so well posted on this is that the Batavia hardwood door mill, in which they are interested, is doing a large business there.

J. B. Wall recently spent several weeks in Michigan closing up some timber contracts. The yard continues to receive hardwood stocks of good size from the South.

W. P. Miller of Miller, Sturm & Miller has been shipping to the local yard from the West stocks of plain oak, which are in such good demand as to remain a very short time unsold.

F. M. Sullivan spent about ten days of January in the West, chiefly in Michigan, where he bought some lumber. Mill stocks are reported to be advancing, particularly maple.

Blakeslee, Perrin & Darling state that the hardwood trade is quite good and most woods seem to be moving freely. A particularly good demand has developed for cypress.

Anthony Miller states that the hardwood trade is not rushing, but is fairly active. He has lately been adding to his stocks of hardwoods, especially in oak, poplar and cherry.

Angus McLean has returned to Bathurst, New Brunswick, after spending some days in this city. Hugh McLean is back from a trip eastward, including New York and Philadelphia.

G. Elias & Bro. report the month of December as having been better than usual in volume of hardwood sales. Trade has also been very fair during the month of January.

D. A. Stewart of I. N. Stewart & Bro. is spending most of January in shipping lumber at Charleston, W. Va. Oak has been selling freely. Low-grade basswood and chestnut are in good demand.

The National Lumber Company has been getting in a good deal of flooring of various sorts and reports prices very strong. Stocks are now being carried in the storehouse just completed.

← PHILADELPHIA →

The regular monthly meeting of the Lumbermen's Exchange was held Jan. 9, President William T. Betts in the chair. A letter from the South Philadelphia Business Men's Association was received at this meeting, asking the exchange to co-operate with it in a resolution urging anew on Congress the claim and advantage of the Philadelphia navy yard for location of a great modern dry dock. The exchange in resolution heartily endorsed the action of the South Philadelphia Business Men's Association. A letter was received by the exchange from the Hon. Bois Penrose, senator of Pennsylvania, asking the exchange to endorse a bill presented by Mr. Penrose in the Senate, for reducing the postage on first-class matter to one cent. The exchange complied in resolution. Some of the members of the wholesale, retail and sash and door trade gave short talks at this meeting on the advantages of association work.

William P. Shearer of Samuel H. Shearer & Son says last year's trading was excellent and so far no abatement. His firm has sold out its yard at Marion, N. C., and opened an office in Fayetteville, N. C., which is in charge of J. H. Langham, who formerly served in another department of the firm. It has secured M. D. Chamberlin, salesman, to cover Philadelphia and southern New Jersey, and V. Paul Hallowell to look after New York state.

Arthur W. Kent, secretary and treasurer of the J. S. Kent Company, says no fault is to be found with last year's sales. But for shipments and collections which are somewhat slow, everything at present is moving smoothly.

H. Billeter, manager of the Co-operative Insurance Company which makes a specialty in fire insurance for lumbermen, says the year's business was satisfactory and the outlook in the lumber field is promising.

George Wright, formerly with the Monarch Lumber Company, has again

associated himself with John W. Coles, with whom he gained his first practical business experience. Mr. Wright, who is one of the best-known young salesmen in the East, will look after the selling and buying. Mr. Coles says he has every reason to be satisfied with the business of 1912, and sees potent signs of a robust trading for the new year.

W. S. W. Kirby of the Kirby & Hawkins Company states that a satisfactory year's business has been closed. The company has every reason to believe in an accelerated activity for the coming year. Railroads are buying freely and there is a healthy demand throughout the trade.

Howard B. France, secretary and treasurer of the Monarch Lumber Company and of the Haddock-France Lumber Company, reports a sustained activity and anticipates a swelling prosperity for 1913. The mill is rushed to the limit and many orders are now sent there direct.

Ralph Souder of Hallowell & Souder says orders are being booked right along, but to get the goods he fears will be a problem hard to meet by many lumbermen this year. The outlook for business is encouraging.

Herbert E. Sumner of the Sumner Lumber Company, New York City, was a recent visitor to the local trade.

The W. R. Taylor Lumber Company has removed its office to 1829 Land Title building, where with larger quarters it will have better facilities to handle the increasing business.

◀ PITTSBURGH ▶

W. W. Vosburgh of the old firm of Bemis & Vosburgh is now located at 1011 Bessemer building, where he will handle the hardwood stocks of the Bemis Lumber Company from its mills at Bemis, W. Va., and Petersburg, Va. The office of Bemis & Vosburgh in the Farmers' National Bank building was closed Jan. 1.

The Duquesne Lumber Company reports a fine eastern business. Since its big mill at Braemar, Tenn., has been operating, the company has been able to keep almost abreast of its shipments. Sales Manager G. C. Adams is working the eastern trade this week.

The B. W. Cross Lumber Company, which has taken over the business of the Thomas E. Coale Lumber Company in the Pittsburgh district, is located in fine quarters in the Oliver building. It has been incorporated with a capital of \$5,000 by the following members: B. W. Cross, Pittsburgh; R. H. Moore, Fred H. Ely, T. F. Dalrymple, Philadelphia; L. R. Harvey, Wilmington, Del.

The Foster Lumber Company is a new hardwood concern at 814 Bessemer building. Within many years it has been operating country mills in western Pennsylvania and West Virginia and established the Pittsburgh office in order to make a clearing house for this business. The company has 1,500,000 feet of standing white oak within street car distance of Pittsburgh and recently bought 300 acres more of good hardwood timber in West Virginia.

J. J. Linchan is making good headway in selling the poplar and oak stocks of Mowbray & Robinson, whose mills are located in Breathitt county, Kentucky. He regards the outlook for business much better than last year.

I. F. Balsley of the Balsley & McCracken Company was in Buffalo and other eastern points last week and found hardwood buyers pretty well disposed toward heavy purchases. He has been getting some splendid orders for chestnut the past few weeks.

The J. C. Donges Lumber Company has a larger force of salesmen than last year as it has added C. E. Bald, recently of the Coale company force. Mr. Donges stands A 1 with the yard trade in western Pennsylvania and his hardwood business is growing rapidly.

A. G. Breitwieser of C. E. Breitwieser & Co. spent the last two weeks in Ohio with the retail yard people. He finds them well fixed in general, in that they have low stocks and are feeling much better over the general situation than for a long time.

The Adelman Lumber Company has recently made some splendid connections which will give it very fine stocks of good poplar to offer this year. Mr. Adelman, president of the company, has been in the South the past two weeks looking after the mill end of the business.

H. T. Lincoln, formerly of Bemis & Vosburgh, is now general manager of the Gibson Lumber Company of Masontown, W. Va. His partner is James C. Gibson of Masontown. The company has 25,000,000 feet of hardwood and hemlock and Mr. Lincoln is pushing its business up to a very profitable notch.

◀ BALTIMORE ▶

The Baltimore delegation going to the annual meeting of the National Lumber Exporters' Association, held at Chattanooga, Tenn., on Jan. 23 and 24, left here Jan. 21. Secretary Price will present his report on various matters that have claimed his attention during the year, one of them being the question of through bills of lading and the complaint filed on the subject with the Interstate Commerce Commission at Washington. This complaint, as stated at the time, was directed against practically all of the railroads east of the Mississippi river and asked the commission to require the transportation lines to abrogate the regulations which serve in effect to stop the exportation of lumber. No time for a hearing has yet been set.

A movement is on foot to form an association of traffic men in Baltimore, with the object of bringing about a closer relationship between those engaged in the transportation business and allied interests. The move-

ment is being encouraged by A. E. Beck, traffic manager of the Merchants' and Manufacturers' Association, and E. A. Walton, district passenger agent of the Baltimore & Ohio Railroad, has also been talking up the matter. A meeting in furtherance of the object is to be held shortly.

The Mann & Parker Lumber Company, dealer in oak, ash, chestnut, cypress and other woods, was incorporated at Dover, Del., on Jan. 16 with a capital stock of \$25,000. The incorporators are Frank A. Parker, Stephen S. Mann and Morris A. Soper. The charter gives the company the right to acquire timberlands and to manufacture lumber of all kinds, but it is not likely that this provision will be exercised. Messrs. Mann and Parker, who were members of the wholesale firm of Mann & Parker, which went into bankruptcy some months ago, blaming a mill enterprise for most of their troubles. The company has offices on the sixteenth floor of the Equitable building. The assets of the firm are still in the hands of a trustee for distribution.

George French Strother, a well-known lumberman of West Virginia, died at his home in Welch, that state, on Jan. 5 of malignant tonsillitis. He was only about thirty-nine years old and his demise proved a great shock to his many friends. Mr. Strother made his headquarters at Welch and was president of the Forest City Lumber Company and of the Dry Fork Planing Mill Company at War, W. Va., on the Norfolk & Western Railroad. He never married. The funeral took place the following Tuesday at Culpepper, Va., where Mr. Strother was born.

◀ BOSTON ▶

Secretary Ernest N. Bagg of the Massachusetts Retail Lumber Dealers' Association is quoted as saying that an appeal will be taken from the recent decision of the United States District Court of New York, which granted a permanent injunction against the Eastern States Retail Lumber Dealers' Association. He stated that the case would be carried to the Supreme court of the United States. Secretary Baggs states that the Massachusetts Retail Lumber Dealers' Association is purely a social organization and that its principal function is the holding of an annual banquet.

The Midland Chair & Seating Company, Portland, Me., has been organized with a capital stock of \$400,000. The incorporators are Albert F. Jones, Albert A. Richards, B. M. Maxwell and A. F. Farnham.

John M. Woods of John M. Woods & Co., Cambridge, Mass., is making an extended trip through the West and South. He was a guest of the meeting of the Indiana Hardwood Lumbermen's Association.

◀ COLUMBUS ▶

Steps are being taken by Governor Cox of Ohio as well as members of the Ohio General Assembly for a complete reorganization of the Ohio Public Utilities Commission which has charge of all shipping matters in the Buckeye state. It is proposed to give the shipper of the state better service by establishing a bureau to look after shippers' complaints exclusively. Lumbermen and building supply men are favorable to the plan of reorganization.

The board of directors of the Columbus Builders' and Traders' Exchange in its annual report showed that plans for buildings valued at \$8,000,000 passed through the exchange during the year 1912. Contracts aggregating \$2,000,000 for outside work were awarded members of the organization. John A. Kelly has been re-elected secretary, and E. L. Harris, treasurer.

Papers have been filed increasing the capital stock of the Conneaut Lumber Company of Conneaut, O., from \$10,000 to \$25,000.

R. W. Horton, manager of sales for the central division for the W. M. Ritter Lumber Company, says trade is firm in every variety of hardwoods. Stocks are extremely light and as a result prices are firm. Both manufacturing establishments and retailers are buying well, but the latter are now the best customers. Furniture men are attending the semi-annual shows, which is making that branch of the trade quiet. All grades are moving well.

J. A. Ford of the Imperial Lumber Company reports a good demand for all hardwoods, with prices well maintained. Shipments are as good as could be expected under the circumstances.

J. C. West, president of the Midland Lumber Company of Parkersburg, W. Va., was a business visitor in Columbus last week.

Secretary Benbow of the Sowers-Leach Lumber Company says trade is good in every direction and prices are firm. The principal drawback to a more active market is the weather, which interfered with the movement of salesmen.

John R. Gobey of the concern bearing his name reports a very fine demand for all hardwoods, with prices strong. There has been a good volume of business with stocks light in most sections. The car situation has improved materially.

F. Everson Powell of the Powell Lumber Company says the volume of trade is good, with prices firm and inclined to strengthen. Stocks are extremely light.

Manager Hodil of the Virginia Lumber Company says trade conditions are satisfactory in every respect, with all grades moving well. Prices are holding up firmly and inclined to advance.

The Hoskins Lumber Company of Mt. Gilead, O., has been incorporated with a capital stock of \$10,000 to handle lumber. The incorporators are John C. Hoskins, M. M. Hoskins, Morris W. Kline, Ethel Elder and J. W. Barry.

The Clearview Manufacturing Company of Wooster, O., has been incorporated with a capital stock of \$10,000 to manufacture window screens and like articles. The incorporators are A. C. Beymer, W. A. Henney, J. S. R. Overholt, John D. Overholt and M. O. Overholt.

H. B. Nelson has taken over the business of the C. T. Nelson Lumber Company, which operated a plant on Dublin avenue. The concern had been operated by B. W. Gerhard as receiver for some time. The new name of the concern is the Nelson Lumber and Manufacturing Company.

◀ CINCINNATI ▶

Both band mills of the Kentucky Lumber Company at Burnside and Williamsburg, Ky., are running full time. President DeLaney just returned from the mill and states that the output will be increased as much as possible. Plenty of fine timber is being received from the La Follett timber recently purchased and, while there is very little accumulation at either mill, the company will be in as good a position to supply the heavy demand of the early spring as any other dealer in this section. The outlook is very promising.

Fred Mowbray of Mowbray & Robinson states that their three mills at Quicksand and Irvine, Ky., are being pushed to the limit and that the supply of logs on hand is fine. Mr. Mowbray states that his firm booked ahead a very heavy business and prices obtained are very satisfactory. He looks for a continuation of the present demand practically all of this year.

Ben. Dulweber of the John Dulweber Company is away on a business trip. Chas. Dulweber stated to-day that he has never seen business so heavy at this time of the year nor prospects so bright. He stated that until recently it was a difficult matter to keep up with the demand, but since the car shortage has eased up a fine lot of new stock is being received.

The Johns-Mowbray-Nelson Company, one of the newest combinations of bustling young lumbermen, is doing a splendid business and is enjoying the success that it deserves. The company is handling the output of several band mills. Mr. Johns reports business as exceptional at this time of the year, with prospects the brightest for a continuation.

Edward Barber of the Howard & Barber Lumber Company states that the export trade is as good as he has seen it for some time and that the domestic business also has been excellent all last year, especially during the latter part. He can see no reason for any interruption either here or abroad and expects to find general conditions improve.

Work on the new Hotel Gibson will soon start upon the site of the old building recently destroyed by fire. Workmen have almost completed clearing away the debris and the Wells Brothers Construction Company of Chicago, which has the contract for the new building, has a large quantity of material on the ground ready to start just as soon as possible.

◀ TOLEDO ▶

President Booth of the Booth Column Company, states that his concern is busier at present than ever before at this season of the year in the history of the plant. The factory is operating with its full quota of men nine hours a day and has orders on hand which will keep them busy for the next two months. The demand is extremely heavy for this season of the year and the stock of columns on hand is much less than is usually carried. The concern has plenty of lumber on hand, but complains somewhat of high prices, oak and yellow pine being the materials mostly used by the plant.

The Big Four Hardwood Company has taken on a new line of industry in the last six months, and is now manufacturing piano cases. The cases made are simply plain stock cases for the piano case factories, where they are veneered and polished. Manager Roberts of the Big Four company says that the new venture has proven more than successful and a big business is being worked up.

John J. Reinhart, treasurer and general manager of the Toledo Bending Company, has returned home after spending several months in Michigan for his health. He is much improved, but not yet able to resume his duties at the office. During his absence his place has been filled by his brother, W. H. Reinhart. Mr. Reinhart reports business good and orders plentiful. Hickory and ash stocks are badly needed and hard to get owing to the scarcity brought about by the soft weather which has prevailed throughout the winter.

The Gottshall Manufacturing Company, which was partially burned out several months ago, is planning to begin the rebuilding of its plant in February.

The Boys' Manufacturing Company is the name of a new manufacturing plant to be opened up at Dayton, O., in the Y. M. C. A. building. It will manufacture box furniture of all kinds. J. Wallace Jerram and J. I. Lambert are among the directors and Platt B. Lawton and C. B. Kern of the Y. M. C. A. are assisting the boys with their plans.

The G. J. Brethauer Planing Mill Company of Dayton, O., will furnish material for the big addition to the N. C. R. Hall of Industrial Education to be erected at Dayton.

A new Toledo corporation has been organized in this city under the firm name of the American Floor Surfacing Company. C. G. Cunningham, L. T. Williams and R. T. Garrison are the incorporators.

The Dayton Wholesale and Retail Lumber Dealers' Association gave a dinner at the Beekel Hotel at Dayton recently. Arrangements were made for sending a delegation to the state convention at Cleveland next week.

At the Dayton meeting the proposed new mechanics' lien law was discussed and agreement made to recommend the enactment of the lien law drafted by Attorney Conley of Toledo, which is patterned after the Michigan law.

Mrs. Elizabeth Lindow, wife of William Lindow of the firm of Lindow, Liebius & Gerchow, furniture manufacturers of Toledo, died Saturday morning at her Palmwood avenue home after an illness of six weeks. She was fifty-eight years old, and leaves a husband and three sons, Edward and Fred W. of Toledo, and William E. of Buffalo, N. Y.

The McCrillis Handle Company, which has been located at Nelle, Coshocton county, will be removed to Norwalk, O., where a new cement, fireproof building with basement has been erected for it. The company still has about a month's work at Nelle, after which the plant will be dismantled and brought to Norwalk. According to the annual report 1912 was the best year the concern has known. Prospects for the coming season are excellent.

◀ INDIANAPOLIS ▶

During the three months ending December 31, rosewood, mahogany and walnut logs valued at \$16,773 passed through the local customs house.

With an authorized capitalization of \$35,000 the Modern Cabinet Company has been organized here and incorporated and will establish a plant for the manufacture of kitchen cabinets. Officers have been elected as follows: President, Charles C. Becker; vice-president, Louis G. Bauer; secretary, Alfred A. Becker; treasurer, George V. Bedell, and attorney, Monte C. Fiscus.

Mrs. Mary K. Russell, wife of Isaac Russell, president of the Capitol Veneer Company, died at the family home, 1660 Ashland avenue, on Jan. 16, after a short illness. Burial was in Crown Hill cemetery. Besides the husband, one son, Ralph Russell, survives.

The Quartered Oak Veneer Manufacturers' Association held a meeting at the Denison Hotel on the evening of Jan. 15. There was a good attendance and a discussion of business conditions followed an informal dinner. Reports received were that while the production had not been decreased since July 30, the supply of dressed quartered oak veneer in warehouses had decreased 1,250,000 feet since that date. Prices were reported firm with an upward tendency and the demand exceptionally good, buyers being plentiful and buying freely.

◀ MEMPHIS ▶

The Mississippi river at Memphis promises to reach a stage of thirty-eight feet. This will cause some inconvenience to a few of the plants on Wolf river in North Memphis. It is not expected, however, that more than one or two will have to close down. Furthermore, it is not anticipated that the interruption to operations will continue for any great length of time. The stage of the river here on Jan. 20 was approximately thirty-five feet. All land lying outside the levees is overflowed. Land protected by the levees, however, is in very satisfactory shape and it is not anticipated that there will be any of this overflowed. Practically all of the breaks in the levee system have been sufficiently repaired to prevent any damage from the present indicated stage.

The heavy rains which have occurred in this section during the past few days have an important bearing upon the timber supply for the late spring. It is a matter of knowledge that a great deal of timber has been prepared for shipping and is therefore available for early use. It is a question as to the extent to which the low lands of this territory are flooded. It has rained every day or two since the first of the new year and the ground is already getting so wet, particularly in low places, that it is almost impossible to do any work in the woods. Last year there was serious curtailment in operations as a result of floods in the Mississippi and the breaks in the levee system resulting therefrom. It is not expected that conditions this year will be as bad in respect to floods, but the continued rains are calculated to interfere with work in the woods and therefore to restrict the amount of timber that is available. Hauling with wagons is almost out of the question already and it is necessary to use other means of getting timber to river banks and the rights of way of the railroads.

Application for a charter has been made by the I. M. Darnell Son Company. The capital stock is placed at \$100,000. In addition to I. M. Darnell and J. D. Allen, Jr., the incorporators are J. D. Cutsinger, E. T. Hazledine and J. L. McClellan. This is practically the personnel which was used by I. M. Darnell & Son Company before the consolidation was made between the latter and E. E. Taenzler & Co., Inc.

The Kinball Lumber Manufacturing Company, St. Louis, has purchased 2,340 acres of timberland from B. T. Gregg and others near the mouth of the White river in Arkansas. The consideration was about \$22,000.

Among the lumbermen who will accompany the Business Men's Club party on its tour of the South and its trip to Panama are the following: Frank May, May Brothers; S. B. Anderson, the Anderson-Tully Company; J. T. Willingham, the Memphis Codin Company, and M. H. Brown of the Mark H. Brown Lumber Company. All of these gentlemen will be accompanied by their wives.

Mr. and Mrs. F. E. Gary, together with Mr. and Mrs. George Foster of Mellen, Wis., will leave Memphis Feb. 8 for a trip to Panama and other points of interest. This trip was planned some time before that of the Business Men's Club, to which reference has already been made.

The Robe-Lake Lumber Company has filed an amendment to its charter through which the name is to be changed to the Brown Brothers Land and Lumber Company. The Robe-Lake Lumber Company was organized several years ago to take over a large tract of land in Arkansas and was controlled by a number of Memphis lumbermen. The incorporators who signed the foregoing amendment are W. B., J. G., and T. M. Brown, W. M. Wood and Leroy Olcott.

Walker L. Welford, vice-president and general manager of the Chicasaw Cooperaage Company, says that the new plant now being erected at Binghampton will be in readiness for operation by the first of February. It will be used chiefly for the manufacture of heading and staves. The old plant at Sycamore and North Front streets will be used for finishing purposes. The former will employ about 200 men and the latter about 250.

J. W. Wheeler & Co., Madison, Ark., have recently made extensive additions to the plant at that point. It was necessary to close down for some time as a result of inability to bring out timber. During the intermission advantage was taken of the opportunity to make repairs and improvements. A resaw has been added and the capacity of the plant has been materially increased. Heretofore the company has cut about 40,000 feet per day. Its output under the new regime will be approximately 55,000 feet. The company is also negotiating for additional timberlands in that section. The recent rise in the St. Francis river has given it an ample log supply for the immediate future.

The plant of the Morgan-West Box Company, Madison, Ark., has been able to resume operations also as a result of the rise of the river at that point. For quite a while it was impossible for this firm to run its plant. It had plenty of timber near the river but the water stage was too low to enable it to bring this down.

← NASHVILLE →

Widespread damage was done in this city and throughout this entire section by the floods during the past ten days or two weeks. The Cumberland river was higher than it has been for the past sixteen years and as a result the lumber interests suffered materially. Many lumber yards in Nashville, located on the river banks, were submerged and in numerous cases the water rose to the engine rooms of the lumber plants, making temporary shutdowns necessary. All along the river banks, both above and below this city, quantities of logs, many of them ready for transportation in rafts, crossties and manufactured lumber were washed away and heavy losses thus sustained. Many rural mills were forced to suspend operations for a time also. In Nashville it is estimated that the losses totaled something like \$10,000 or \$12,000. The river is now again within its banks, however, and operations have been resumed.

The Nashville Lumbermen's Club has invited the Louisville, Ky., organization to visit this city the second Tuesday in February, which invitation has been accepted. The Kentuckians will reach Nashville early in the day and will be shown numerous attentions, including a banquet at the Commercial Club in the evening. They will be given a genuine good time.

An increase from \$9,000 to \$15,000 has been made in the capital stock of P. L. Estes & Co., manufacturers here of woodenware, etc. This increase was made necessary by reason of the growing business of the company. The company will install additional equipment.

Members of the local trade anticipate considerable benefits as a result of the completion of the Panama canal. The opening of this canal will mean more to the lumber trade of this section than to any other branch of export business. The southern trade at present is largely confined to eastern states and Europe, but the canal will make it possible to develop large Pacific coast interests as well as trade in South America.

← BRISTOL →

Dr. C. S. Aldrich of Johnson City, Tenn., was a visitor here this week. He is president of the Carolina Spruce Company, a large lumber corporation which is installing a big band mill near Pensacola, for the development of a large area of timber. The mill is on the Black Mountain railroad, which connects with the new Clinchfield. It will soon be put into operation.

O. H. Vail of Waynesville, N. C., head of the Waynesville Lumber Company, was a visitor in Bristol this week. His company has completed the erection of a band mill at Waynesville, for the manufacture of a large area of timberland twenty miles east of Waynesville. A line of railroad has been built and the company will turn out a large quantity of stock.

Fred K. Paxton of the Paxton Lumber Company, who has been located at Charleston, W. Va., in charge of the company's new operations in that section, is a visitor at the general offices in this city.

It was announced this week that the Norfolk & Western, Southern & Virginia and Southwestern, will, before Feb. 1, put into effect the reduced milling-in-transit charge at Bristol, in accordance with a recent order of the Interstate Commerce Commission in the case of the hardwood lumber interests of Bristol against the railroads. They will be compelled to make restitution of one half cent per hundred pounds on all milling-in-transit shipments since the rate was arbitrarily advanced from one to two cents. The new rate is one and one-half cents.

The Wilkinson-Matthews Lumber Company, which was organized in Bristol some months ago by E. H. Wilkinson, J. H. Matthews and others, last week filed a voluntary petition in bankruptcy. The assets are \$18,000 as against liabilities of \$21,000.

Among the buyers in Bristol this week was Frank B. Clayton, of the American Lumber and Manufacturing Company of Pittsburg, which is buying heavily on the Bristol market at present.

J. A. Stone of the Stone-Huling Lumber Company, has returned from a business trip to Norfolk and Washington.

The Levisa Land and Timber Company was organized last week at Grundy, Va., by E. R. Boyd and associates, with a capital stock of \$50,000.

← LOUISVILLE →

J. E. Barton, state forester of Kentucky, has taken occasion, in view of the floods along the Ohio, Kentucky and other streams in this state, to point out the possibility of preventing them by the placing of forests at their headwaters. He takes the ground that floods are largely due to the cutting out of forests at the sources of the streams, denuding the land and permitting the rainfall to run off immediately. This has the effect of causing flood conditions when with the forests present the stage of the rivers would not rise to a dangerous point. He urges that this question be taken up by Kentucky and neighboring states, and adds that his department is already entering into a study of the question.

The flood caused a considerable damage in Louisville, chiefly, however, through interruption of business. Among the concerns which were compelled to stop their operations for the time being were the Louisville Point Lumber Company, Louisville Veneer Mills, Booker-Cecil Company and the Booker Box Company. The yard of the Booker-Cecil Company was not actually flooded, but the tracks of its switches were covered, so that business could not be continued for several days. The Louisville Point Lumber Company succeeded in removing most of its lumber before the water got into its yard, so that its loss from flooded stock will be relatively small.

The Roberts-Conner Veneer Company, New Albany, Ind., across the river from Louisville, had to shut down on account of the flood. B. W. Lord of the Chicago Lumber and Veneer Company, Burnside, Ky., estimated the loss to the lumber and timber interests of the Cumberland valley at close to a million dollars. His own company was fortunate in saving most of its logs. The Kentucky Lumber Company, Burnside, suffered through the flooding of its yard. B. F. Rakestram of Burnside is reported to have lost lumber valued at \$25,000 from the flood. The Cumberland river situation is being used as a strong argument in favor of improving the river and creating a navigable stage for most of the year. Kentucky river mills suffered as well as those on the Cumberland river. Those at Frankfort were invaded, but as several were closed down anyway, the loss was comparatively small.

The Louisville Board of Trade has engaged Louis B. Wehle to prepare its complaint, which is to be filed with the Interstate Commerce Commission against the Louisville & Nashville Railroad Company for the purpose of compelling that road to accept switching from competitive points. The board believes that the present statutes afford ground for relief, but additional help will be given by Congressman A. O. Stanley, who has secured a favorable report on an amendment to the interstate commerce law which will force the railroads to accept switching business of the kind to which the Louisville & Nashville objects.

State Forester J. E. Barton hopes to be able to secure the use of government funds under the Weeks law for the establishment of a patrol system in the forests to prevent fires and waste. The state will put up an amount equal to the expenditure authorized by the federal government. Mr. Barton is compiling statistics showing the increase in timber values in this state. He is to be given the services of an assistant, the work of the department having developed rapidly since he took hold four or five months ago.

The fact that the production of lumber in Kentucky fell off in 1911 as compared with previous years is not taken to mean that the state is losing its grip as a manufacturing section. On the other hand, it is pointed out that numerous mills are being located in eastern Kentucky, which is now being opened up by new railways, and that during 1913 and 1914 the production of hardwood lumber in this state should be close to a billion feet. In 1911, according to figures of the Census Bureau, the manufacture of lumber amounted to 632,415,000 feet.

The Kentucky, Tennessee & Alabama Railroad is to build between Wilhamsburg, Ky., and Chattanooga, Tenn., paralleling the line of the Cincinnati, New Orleans and Texas Pacific for most of the way, it is reported. It is to take the place of the Appalachian Railroad Company, which was chartered last May.

R. S. Hill, formerly general manager of the Adler Organ Company of Louisville, has purchased the old factory building of the Chilton-Guthrie Trunk Company in Highland Park, south of Louisville, and is now equipping it for the manufacture of organs. It will have a capacity of 4,000 a year, he states. Mr. Hill will be in the market for lumber, including dimension stock, veneers and possibly glued-up stock, as soon as his factory is in running condition, which will be in about sixty days.

J. M. Rice of Dry Ridge, Ky., is preparing to establish a small band mill, and is in the market for used equipment of that character.

The W. F. Gokra Tie Company, Cleveland, O., is reported to be planning the establishment of a tie creosoting plant at Maysville, Ky.

Among the Louisville hardwood men who attended the annual of the Indiana Hardwood Lumbermen's Association in Indianapolis last week were T. M. Brown of the W. P. Brown & Sons Lumber Company; Edward

L. Davis of the Edward L. Davis Lumber Company; Roscoe F. Smith of the Ohio River Sawmill Company; and Stuart R. Cecil and P. G. Booker of the Booker-Cecil Company. All are members of the Louisville Hardwood Club.

— < ST. LOUIS > —

The meeting of the Lumbermen's Club set for Jan. 21 has been postponed until Feb. 4, owing to several lumber conventions taking place during the week of Jan. 21.

At a meeting of the board of directors of the Lumbermen's Exchange, held Jan. 9, W. W. Milne was re-elected treasurer and George McBlair secretary. At another meeting of this body, held on Jan. 21, several important matters were discussed. Among them were the re-adjustment of the insurance law, the inspection department and the traffic department. In the matter of insurance, the insurance committee was instructed to get better protection by formulating some scheme in the way of a new law. President Smith was instructed to select an inspector who was well posted in hardwoods as well as yellow pine. The traffic matters were placed in the hands of Chas. E. Thomas, who will look after that department personally. Under the new administration the financial condition of the exchange will be made much stronger than in the past. President Smith also announced the names of the various committees and his selection was ratified.

At a meeting of the executive committee of the Lumbermen's Club, held on Jan. 21, the matter of introducing a bill in the Legislature to create a Bureau of Forestry was recommended. A number of other matters were also discussed, the nature of which was not disclosed.

E. W. Blumer, sales manager of the Lothman Cypress Company, left last week for the Oshkosh, Wis., plant, where he will put in shape several kilns which were destroyed by fire recently. Following this he will go through the eastern territory on a selling trip.

W. W. Dings of the Garetson-Greason Lumber Company spent several days in Kansas City last week and of course he returned with a nice lot of orders. Mr. Garetson, who has been on the Pacific coast for several weeks, has returned home. Mr. Dings reports that the company is sold up on oak, that all its mills are running and that prices are more than satisfactory.

— < MILWAUKEE > —

The will of the late Edward Bradley, a well-known Milwaukee lumberman, has been admitted to probate. The will disposed of an estate valued at \$3,600,000, composed of real estate valued at \$600,000, and personal property valued at \$3,000,000. Each of his three daughters receive one-third of the estate.

The plant of the Kankana Lumber and Manufacturing Company was destroyed by fire on Jan. 12, causing a total loss of the sawmill and dry-kiln, valued at \$25,000, with insurance of \$10,000. The cause of the fire is unknown.

The Marinette & Menominee Box Company, of which John A. Cook of Marinette is president, will engage in the manufacture of lumber for its own use in manufacturing boxes. Heretofore the company purchased all its lumber from mills.

The State Conservation Commission will recommend a one-tenth mill tax for twenty years, the funds to be used for upbuilding the forest reserve. The tax would raise \$284,000 a year and would permit the purchase of timber tracts in northern Wisconsin. State Forester E. M. Griffith believes that the state must own more than the present 400,000 acres. The tax on growing timber should be lowered, he said, and the harvest tax raised to conserve the forests.

The W. E. Priestly Lumber Company has been incorporated by W. E. Priestly, G. W. Priestly and E. Von Briesen at Milwaukee with a capital stock of \$20,000.

M. H. Hand of Plymouth, proprietor of a successful lumber business, has taken members of his family into the business and incorporated as the M. H. Hand Lumber Company. He will be president of the firm, which has a capital stock of \$40,000.

J. D. Mylrea, C. L. Hale and W. H. Mylrea have incorporated the Hale-Mylrea Lumber Company at Wausau with a capital stock of \$12,000.

The sawmill of the Bayfield Box and Lumber Company has commenced operations, and an immense business in handling hardwood is expected. New life has been put into the plant and a big run of business is planned.

At the annual meeting of the Hardwood Products Company of Neenah the election of officers resulted as follows: W. C. Wing, president; D. L. Kimberly, vice-president; C. B. Clark, secretary; E. D. Belas, treasurer.

T. T. Jones, formerly with the G. W. Jones Lumber Company of Appleton, has assumed the position of manager of the hardwood department of the Webster-Whipple Lumber Company at Minneapolis, Minn.

Provided that sleighing continues for several weeks more, the logging operations this year in northern Wisconsin will be one of the largest in its history. That the 1913 cut will exceed any previous total by fifty per cent is predicted by prominent lumbermen in that section. The good demand has brought out nearly every operator.

Mrs. Florence J. Peck of Fond du Lac and Mrs. Benjamin Hopper of Oshkosh have acquired the interest of C. J. Medberry in the Gurney Refrigerator Company. Mr. Medberry was president and general manager since organization, and the sale places the control of the plant, employing

more than 200 persons, in the hands of the two women. The company started in a small way in 1890 in Oshkosh. After a fire it was moved to Fond du Lac, where it grew into a \$500,000 annual business concern. David Jack, one of the original founders, died recently.

— < CADILLAC > —

Henry Ballou, general manager of Cobbs & Mitchell, Inc., wife and daughter, sailed Jan. 23 for a thirty days' cruise to the West Indies and will touch at Colon. Mr. Ballou expects to arrive home early in March.

W. W. Mitchell, president of Cobbs & Mitchell, Inc., and The Mitchell Brothers Company, wife and daughter have left for a tour in the South, centering around Augusta, Ga. Mr. Mitchell shipped his large touring car and will motor through a portion of the South. He expects to be away from four to six weeks.

F. J. Cobbs of Cobbs & Mitchell, Inc., wife and son will locate at Los Angeles, Cal., for the winter.

Unless there is more snow in Michigan, outside of what is known as the "snow belt," parties expecting to put in logs, wood and other commodities will be minus a sleigh haul. Even in Cadillac the sudden change in the weather has broken the sleighing and as a consequence 300 teams are idle. This will mean a large decrease in the input of logs, unless more snow falls. It is a fact that at Petoskey and Harbor Springs the ground is as bare as in the summer time, and Little Traverse Bay, which is usually frozen with ice at this time of the year, has not yet been frozen.

The Oval Wood Dish Company of Traverse City has enlarged its clothes pins department, employing forty additional men. It will turn out one carload of the finished product, amounting to 1,500 boxes of five gross, a day. This company now employs 500 hands and the factory runs continuously during the year. It will use not less than 15,000,000 feet of lumber and produce 1,200 carloads of an average of four cars per day in all of its products, wood dishes, clothes pins, etc.

The Hardwood Market

— < CHICAGO > —

Steady increase in demand on the part of all consuming factors in Chicago have marked the last two weeks in the hardwood business of this city. The inventory season is practically over, and with few exceptions the local factories are in the market strongly. There continues to be every reason to anticipate strong business during the next year. As in other sections of the country, the furniture trade in Chicago is strong and manufacturers are predicting even greater demands for their product, which naturally will result in increased demand on their part for hardwood lumber of various kinds. As in the furniture trade, so in the other lines including the implement manufacturers, millwork houses, door concerns, car shops,—all are showing a decided disposition to get hold of sufficient supplies of dry hardwood lumber at any reasonable figure. They evidently have come fully to realize the absolute necessity for buying now wherever they can do so on any reasonable basis.

There is no boom—present conditions are the result of a natural healthful improvement in all business, which has been reflected particularly on the lumber business.

Local lumbermen have experienced some added difficulty in making deliveries on account of flood conditions in the South. No one is predicting any accumulation of hardwood stocks during the next six months, and all are predicting at least a maintenance of present hardwood values and a probability of a gradual increase in most lines of staple stock.

— < NEW YORK > —

The local hardwood market continues firm in the matter of price, though there is noted some decrease in volume, but this is only reasonable and the demand will doubtless pick up after inventories are completed. Stocks are reported low at mill points as approaching the spring season which shows every likelihood of being active. Stocks on hand in most cases are badly broken. Birch and maple continue strong in demand and firm in price, while plain and quartered oak are in good call; ash is also in good demand at good prices. It is expected that the yard and factory trade will shortly be in the market for large supplies.

— < BUFFALO > —

Trade in hardwoods is quite satisfactory and has shown a good deal of improvement as the month progressed. Scarcity of the better grades of a number of hardwoods has turned inquiry to the lower grades, which are also in small supply. The demand has been well distributed over the list and the prices of all varieties have been holding firm. Dealers are looking for business to make a good showing for some time ahead, and for prices to hold very strong in most woods.

Plain oak, both red and white, has as usual led in demand, it being immaterial to many buyers which is supplied. Quartered oak in firsts

and seconds is moving pretty well, although the common is not active. Brown ash is one of the other woods in better than average demand. Maple shows a tendency to advance and is being held at unusually strong figures at the producing points. Chestnut is stated to be in normal demand, while poplar remains a rather slow mover, though direct shipments are being made West.

◀ PHILADELPHIA ▶

Although somewhat of a hiatus is always expected during the opening weeks of the new year, owing to the natural distractions of the holiday season and the balancing of accounts for the past year, the hardwood market has maintained a reasonable activity during the last fortnight; many inquiries have been made and a considerable amount of business booked. Evidently the business man is anticipating a prosperous year, consequently is making every effort to secure himself with sufficient stock ahead. Although reports from the mill end indicate better conditions as to logging, etc., the orders already placed will no doubt prevent any accumulation of stock for months to come.

The wholesale consumers continue fairly active, and an optimistic feeling as to outlook is expressed on all sides. There is no indication of a

diminution in activity among box makers, and building operations for 1913 are in for a large volume of business for interior finish work. Conservative houses concede that everything looks satisfactory for the coming year, but the momentous question, "Can you deliver the goods?" is already being heard in many places among the anxious buyers.

There is no sign of wavering perceptible anywhere in hardwood prices, and any probable change will more likely strengthen than weaken values. Oak continues king of woods, with quartered oak climbing; ash shows improvement; basswood, maple, birch and beech are in good demand; poplar holds steady; mahogany is much called for in the furniture trade.

◀ PITTSBURGH ▶

Some easing off in buying is noted in the hardwood market since the first of the year, particularly in the East. This is reported to be due to the fear of unwise tariff agitation. In general, however, the tendency is toward strong buying even for delivery six and eight months ahead. Prices are good and there is no doubt but that business is coming in in a much larger volume than last year. Yard buying is not satisfactory. Retailers have been unusually careful this winter in taking stocks and are looking ahead with a wise eye to forecast the building situation more carefully before they order heavily.

◀ BOSTON ▶

The feature of the hardwood market in Boston is the strength with which prices are held rather than activity to demand. Practically all of the reports from mill sections of the country indicate renewed strength upon the part of manufacturers. The stocks of hardwood lumber at mill points are not large and manufacturers insist upon asking prices, feeling they are justified in doing so. There may be a few lots offered from time to time that would indicate that the holders were not quite as firm as reports show, but when the whole story is told, it is generally found that the offerings are not up to standard or that some manufacturer is in need of cash and is willing to make a concession in order to get the ready money to meet some pressing obligation.

The general demand for hardwood lumber in this market is fair. Consuming manufacturers are doing a good business and in but few cases are their stocks of lumber large. For several weeks reports have tended toward a further advance in plain oak, and during the past two weeks some dealers have actually asked a higher figure. This is especially true of stock coming from Indiana and Ohio. Quartered oak has also been firmer with a better demand. Low-grade poplar continues to sell well, but the top grades are not active. Ash has attracted a fair amount of business, and the demand for elm has ruled moderate. Cypress is in fair call.

◀ COLUMBUS ▶

The hardwood trade in Columbus during the past fortnight has been active in every direction. The demand for all varieties and grades has been good and prices have been well maintained. Stocks in every locality are rather light and no accumulations are reported in any section in this territory.

One of the worst features of the trade has been the high waters which shut off traffic on a number of railroad lines from the hardwood fields. This is especially true of the C. & O. and the K. & M., which cross the Ohio river into Ohio from the West Virginia fields. The bridge on the C. & O. was destroyed and traffic on the K. & M. was suspended for almost a week. The net result of this state of affairs was a dearth of stocks in many places. The car shortage is still bad, although not so many complaints have been heard recently.

Manufacturing establishments are still the best buyers of hardwoods, although the yard trade is in the market for larger stocks. Retailers' stocks are light and there is every indication of active building operations. Factories engaged in making furniture, implements and vehicles are buying larger stocks.

Quartered oak is in good demand in every section and prices are firm. There is a good demand for plain oak, both red and white, at firm prices. Chestnut is one of the strongest points in the market, with sound wormy especially in demand. Poplar is more active and stocks of the lower grades have decreased. Ash is selling well and the same is true of basswood. Other hardwoods are unchanged.

◀ BALTIMORE ▶

The hardwood business has been somewhat quiet so far this year; at least some members of the trade have found it so, while others state that they are getting a considerable number of orders and have nothing whatever to complain of. However, even those who report quiet admit that they have no unsold stocks of dry lumber on hand, and that they find it exceedingly difficult to obtain supplies which they could readily place. Apparently lumber is not any more plentiful than it has been in months, with the demand sufficient to take up promptly the output of the mills. The exceptionally mild weather in the East facilitates operation of mills and the production is likely to run ahead of most other years, though the absence of snow is something of a drawback, logging being made more difficult. Apparently there is a place for all the lumber that can be turned out and the accumulation of a surplus is not looked for.

It is also to be said that the range of prices has gone up rather than reacted, with the prospects decidedly favorable for another advance. Not a single item on the list shows weakness, with the exception, of course, of extra wide poplar, which has had no recovery whatever. Oak is very strong in practically all divisions, the domestic demand as well as the foreign inquiry being active. All the reports from the other side of the Atlantic are to the effect that stocks abroad are much lower than is usually the case and that the buyers manifest a disposition to meet the prices of the shippers, which evidence no signs of an easing off, though a change may come, if reports about the disruption of the Atlantic steamship pool, recently published, have a substantial foundation. Should the agreement between the various lines go to pieces on account of the action of some of them in establishing lines to new points in competition with the routes already in operation, ocean freight rates may take a decided drop, which would necessitate another readjustment. For the present, however, the rates hold firmly and export prices must be based upon them. As a rule the foreign stock lists show the various woods to be in far smaller supply at different ports than they have been in times past, and new shipments are being encouraged so as to bring the selection up to the required proportions. In the domestic market it is a case of buyers finding lumber at fair prices in sufficient quantities to meet their wants, which is by no means easy. The market is mainly a manufacturers' market, and the millmen are making attractive profits.

< CINCINNATI >

Bad weather has had the effect of checking up activities at the hardwood yards. Dealers are getting as much stock together as possible in anticipation of a very heavy early spring business. Stocks are arriving much more freely than for many weeks and, with the demand a little slack during the stock taking period, dealers hope to get a little ahead. All dealers express full confidence in the future market conditions and that prices will advance as the season advances. At producing points manufacturers will accept no business except at top prices, and few of them have much stock, despite redoubled efforts on their part to increase production. Buyers in the South are very plentiful and millmen need not reach out far to secure business. Factories are all running and are well supplied with orders for many weeks to come. None of these plants has much stock and are sending out numerous inquiries for supplies.

About the only change noted in the poplar market condition during the past week is the much better demand for the upper grades, which have not been doing well lately. This change for the better is not only encouraging to dealers, but bears out manufacturers who have been holding this class of stock at stiff prices. The demand for No. 2 and 3 common continues, the feature being the scarcity of these grades.

All grades of plain oak are in demand, as is chestnut. Quartered oak is strong in demand and price. Ash sells well and thick stock is much in demand and scarce. Poplar, basswood, cottonwood and gum in low grades are very scarce and bringing good prices. The upper grades of gum are becoming stronger all the time and firsts and seconds red gum is expected to advance quite a little in price on account of the demand for this stock, which is growing quite scarce.

After having to put up with the inconvenience of a steady rain for three days, the weather has settled down to fine, crisp but sunny days that will put new life into the lumbermen who have yards and are badly affected by such conditions. The receipts are very encouraging and as demand has slackened up a bit lumbermen are fast getting into a good position to take care of the expected heavy early spring business. All branches of the industry are in a very healthy condition, and the most optimistic expressions from the best posted lumbermen as to the prospects for good business are the best evidence of their confidence in business conditions. The activity of the factory trade all over this section is remarkable for this time of the year, and they are all well supplied with orders that will insure their running right along for many weeks.

The box manufacturers have been very busy and are calling for almost any kind of low-grade hardwoods suitable for making boxes. Most of these concerns usually carry large stocks in their own yards, but the consumption has been so great during the past several months that they are about cleaned out of stock and are taking all stock offered at reasonable prices.

< TOLEDO >

Conditions here have not changed greatly but stocks are badly broken. This condition also prevails at the mills, many of the southern mills being oversold for at least four months. There is very little if any speculative buying but buyers are taking about all the lumber they can readily secure for present use. The supply, however, in many lines is short. Plain red oak is leading the demand here. Good dry stocks are extremely scarce and the law of supply and demand regulates the prices. The better grades of hickory are in good demand just now and extremely hard to get. There is plenty of hickory to be had but the weather this winter has been extremely unfavorable for getting out logs, which accounts for the scarcity. Prices are of course consequently high. White ash is among the called for woods, much of it being used by automobile factories. Basswood is light as elm is being substituted quite freely for this material. The call for elm is strong with fair supply. The call for red gum is strong in both high and low-grade lumber, the heavier call being for the low-grade stock, which is largely used by boxing and crating concerns.

VENEERS

THAT ARE

UNIQUE, STRIKING, BEAUTIFUL

☛ The C. L. Willey Veneer plant recently secured three magnificent logs in the Liverpool market of unknown botany.

☛ In tone, texture and color they could readily pass for mahogany.

☛ In the faultless manner, for which the Willey plant is celebrated, they have been sliced into 1/28 veneers, ranging from 15 to 30 inches wide.

☛ The figure is a very large, broken, mottled stripe.

☛ The illustration in actual size from a small section of this wood in this column does not do it justice.

☛ There is only 150,000 feet of it. It will be sold at an attractive price, and it should go into the hands of some concern that wants to make a reputation for itself in a fine piece of interior finish or to a piano factory, which would be interested in something distinctly attractive for piano veneers.

☛ It's well worth a trip to the Willey plant to see this splendid wood.

☛ Both local and visiting buyers are cordially invited to call and inspect the Willey plant, and the contents of its big veneer and lumber warehouses on Robey St., near Blue Island avenue. Take Blue Island avenue car at the postoffice to Robey street.

C. L. WILLEY, Chicago

Largest Mahogany Veneer and Lumber Producing Plant in the World

Lumbermen here are watching with considerable interest the political situation and are awaiting with more or less anxiety the action of Congress in regard to lumber.

The furniture manufacturers in this section recently raised the price of their product twenty-five per cent, owing to the increase in the price of lumber which has shown no indications of weakness.

INDIANAPOLIS

The hardwood market locally and in the immediate vicinity is reported to be in a very satisfactory condition. A number of inquiries are coming in and quite a few orders are being placed. The volume of business is not unusually heavy, but it is about normal and much better than it was at this time last year.

Furniture manufacturers who have returned from the Grand Rapids and Chicago exhibits report that the outlook for their business is unusually good and this, of course, will be reflected in the business of the hardwood and veneer manufacturers.

Prices are steady and are slightly higher than they were at this time one year ago. There appears every reason to believe that a good trade in practically all grades of hardwoods may be expected during the next few months.

MEMPHIS

The hardwood market is in a very satisfactory position. There is a good demand and prices are well maintained as a general rule. There is exceptional strength in the lower grades of cottonwood and gum, which are in active request and which are offering in rather small quantities as compared with the demand therefor. The box factories are in the market for considerable quantities of gum and are unable to secure all their needs. Plain oak is also a strong feature. The demand is good in all grades and the offerings are not heavy. There has been no increased activity in quartered oak but the market is firmer. The upper grades of cottonwood and gum are in fairly active request, although there is not as much strength in these as in the case of the lower grades. Ash is in good demand and offerings are not free in dry stock. In fact some deliveries are being made before the lumber is thoroughly dried. Cypress is moving at a moderate rate. The lower grades are relatively firmer than the upper. Export demand is good and there is a disposition on the part of exporters here to anticipate a more liberal movement to Europe as soon as the railroads west of the Mississippi river have been forced to issue through bills of lading on lumber shipments. At present all of this business is being handled with large expense and much delay on local bills to ship side.

NASHVILLE

While Cumberland river floods have naturally curtailed the amount of the local hardwood lumber trade here for the past week and more, the tone of the market continues satisfactory, with active demands and numerous inquiries. The calls for oak are active. Chestnut and poplar are slower. Numerous rafts were scattered by the floods and many plants at least partially submerged by the high waters, but the river is again within its banks and heavy receipts of logs will soon be reported here. Railroad traffic is active, especially with the shipments of logs and lumber. Manufacturers are optimistic regarding the outlook for the present year. Prices are steady.

KNOXVILLE

The lumbermen in this vicinity are enjoying a very good business. They report that collections are getting easier; that they are finding ready sale for all classes of hardwood, and anticipate a very good business for the first half of 1913. There is a scarcity of hardwoods of dry stock in first hands, and the wholesalers are complaining that they are having considerable trouble in securing enough stock to fill their orders.

BRISTOL

Conditions in the lumber trade in this section continue favorable. The mills are more active than usual at this season of the year, due to the heavy demand for stocks and the fact that many of them are heavily over-sold. The outlook is considered most favorable. Shipments of late have been heavy and a large volume of business is being done. It is believed that prices will improve steadily during the coming months.

LOUISVILLE

The hardwood lumber market is in an exceptionally strong position at present as the result of interruptions to manufacturing operations in most of the producing territory. The mills, especially the small ones out in the country, which have not much equipment for handling logs under bad conditions of weather, had a fine run of it through the fall and for a week or so in January, but since then have been put out of it by heavy rains, floods and all the rest of the happenings that are scheduled for this time of the year, and there will be nothing more stirring as far as making lumber is concerned until spring arrives. This applies to a good many fairly large-sized mills in the South, too, and means that the supply of lumber now on sticks must be regarded as the available market

supply until another season's operations have matured in the form of lumber ready to ship.

In view of the powerful demand for export lumber, on the one hand, and the prosperous condition of business with domestic consumers on the other, the prospects can hardly help favor rising hardwood values, and certainly the market has every reason to be firm and steady. Furniture manufacturers have found business so good that they are raising prices from five to ten per cent, as they have been justified in doing for some time. Vehicle manufacturers did that some time ago, and as the demand is present, they are doing a good business under better conditions as to profits. That makes for a freer movement of supplies and more aggressive manufacturing operations.

— < ST. LOUIS > —

Since Jan. 1 the hardwood situation has been quite satisfactory, both in the way of business and in prices. The demand has been good, much better than during any corresponding period for some time. Dry stock is very low and the demand is much better than the supply, in spite of the fact that mill operations have continued almost up to the first of the year.

Oak has been the best item in demand. Plain oak is particularly scarce. Quartered oak is also in big demand. Thick ash is much sought after. The result has been that high prices are obtainable for these three items. Red gum and cottonwood command satisfactory prices because of the scarcity. The cypress demand keeps up and is increasing right along. Buyers find this item hard to get and are willing to pay good prices for it, if obtainable. Those having a good stock on hand can get good prices, but are holding off anticipating a rise.

— < MILWAUKEE > —

The local hardwood trade is decidedly more active than it was a fortnight ago. Most of the manufacturing concerns have completed their annual inventories and now have time to think of purchasing lumber. Stocks at practically all the manufacturing plants are light and some good orders will have to be placed within the next few weeks. Coupled with this fact is the certainty that the coming building season will be practically as active as the past season, when all records in this city were broken. The feeling everywhere seems to be that 1913 will be a banner year for the hardwood trade.

Inquiries from various sources and actual orders are increasing daily, while dry lumber in nearly all lines is hard to get. Jobbers and retailers say that further price advances are sure to follow within the near future. Prices are firm in all lines. Dry birch is about exhausted here and manufacturers are looking for substitute woods, wherever possible. Most of the sash and door and furniture concerns are looking for birch in both upper and lower grades and are willing to pay good prices. The furniture manufacturers expect a good business from now on. The implement manufacturers in this city and vicinity are running full time and placing some good orders for hardwood.

The situation in both plain and quartered oak is about unchanged, with the supply almost exhausted. Southern concerns seem to be asking rather stiff prices and local buyers are inclined to proceed carefully. The demand for maple is strong. Basswood is moving well also.

— < LIVERPOOL > —

Market conditions here have not been very satisfactory for traders during the past month. The congested state of the Liverpool quays and the shortage of labor makes trade very difficult. At the present time there are a half-dozen steamers in dock which have been in port for over a fortnight without discharging their cargoes. Prices keep very firm, although one or two lines show signs of weakening. One of these is hickory. High prices have been paid and are being paid for several shipments which have arrived on consignment. The shipments, however, are heavy—too heavy in fact. The extent of them has had the tendency of frightening buyers. Shippers are warned not to send in any parcels of such large dimensions.

The mahogany position keeps keenly interesting and animated. All information seems to confirm the small extent of the timber stocks on the African coast, and it is predicted that prices will again advance at the next sales.

The round ash market is one of the finest here at the moment, especially with parcels of large dimensions. Brokers here are trying to force the price up. Ash lumber is good and finds a ready sale, especially with prime white ash stocks. No. 1 common stocks are also good, but buyers here complain of the widths this stock is sold in—it is too narrow for this market. If shippers could send No. 1 common ash 6" and up wide, the stock would find more ready acceptance. The 4"x5" pieces are practically useless and this renders the value of No. 1 common stocks on a much lower basis. Shippers are advised to send in the wider widths even though the grading rules permit the 4"x5" pieces.

Poplar stocks are a good point and find favor with most merchants at enhanced prices, as also do shipments of prime oak, both plain and quartered. Birch is scarce. Cottonwood boards in wide widths 1"x18" and up are a good point and are bringing good prices for prime stock. There is also a good market for No. 1 common wide stocks. Wide sap gum stocks are also being imported in greater volume. Tupelo gum is in more favor, particularly in 5/8" stock.

On the Following Stock We Will Make Special Prices for Prompt Shipment:

62,000 ft. 1 1/2" No. 2 Common Poplar.	69,000 ft. 1 1/4" S. W. and No. 2 Com. Chestnut.
91,000 ft. 2" No. 2 Common Poplar.	522,000 ft. 1 1/2" S. W. and No. 2 Com. Chestnut.
10,000 ft. 1 1/4" No. 1 and 2 Qld. Poplar.	40,000 ft. 1x12" and up No. 1 and 2 Chestnut.
45,000 ft. 1x24" and up No. 1 and Panel Poplar.	49,000 ft. 1" No. 1 Com. Chestnut.
30,000 ft. 3x8 to 20 No. 1 and 2 Poplar.	33,000 ft. 1 1/4" No. 1 Com. Chestnut.
15,000 ft. 4x18 and up No. 1 and Panel Poplar.	41,000 ft. 1 1/2" No. 1 Com. Chestnut.
55,000 ft. 5 8x18" and up No. 1 and Panel Poplar.	32,000 ft. 2" No. 1 Com. Chestnut.
154,000 ft. 1" S. W. and No. 2 Com. Chestnut.	15,000 ft. 1 1/2" No. 2 Plain Oak.
	198,000 ft. 2" No. 2 Com. Plain Oak.
	60,000 ft. 1 1/2" No. 1 Com. Plain Oak.

TIMBER TALKS

THERE ARE POINTERS FOR YOU

In the new book we have just issued. If you have not received a copy, send for one, using the form given.

In "Pointers" we treat of timber investments and values in a general way. Particular kinds or tracts of timber in different localities are not considered in detail.

We have given a glimpse of the facilities of our organization in this book, but are holding in reserve a big supply of

POINTERS

about timber in all sections of North America, including the particular locality in which you may be interested.

Our organization is equipped to make preliminary examinations or detailed reports on timber in any locality. We shall be glad to co-operate with you in making that next deal and are satisfied we can aid you to reach a decision whether you wish to buy or sell.

W H Y ?

WHY DO more than 320 of the most prominent and successful lumber manufacturers exchange nearly \$26,000,000 of indemnity against fire loss at

Manufacturing Lumbermen's Underwriters

B E C A U S E !

BECAUSE it is the oldest and strongest inter-insurance association among lumbermen, being now in its fourteenth year.

BECAUSE \$728,910.41 cash savings have been returned to members.

BECAUSE \$756,787.21 cash surplus, owned entirely by the members, has been accumulated.

BECAUSE \$2,012,427.96 has been paid in losses under prompt and equitable adjustments without resort to quibbling or technical controversy.

BECAUSE it was the first to settle lumber losses on a market value basis.

BECAUSE the regular, frequent and thorough inspections given the plants of all members help them to prevent fires, thus materially reducing both the fire waste and the cost of indemnity.

Manufactured only by

Saranac Machine Co., St. Joseph, Michigan

One of the largest hardwood operators in the U. S. says:

Costs 50 cents per M.

From the time we stop hauling logs by horse the road from 200 feet to 1/4 mile, and be skidding logs in thirty minutes. There is no comparison in the old and new way of moving the timber, and skidding logs. We think your skidder is the best on the market, and there is no comparison to be made between the ground skidder and even a system for hardwood timber.

Your truly

(Copy of complete letter sent on request)

You should investigate the

Clyde Self-Propelling Skidder

It means more logs for less money than by any other method—and we can prove it!

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

CHICAGO OFFICE, Steger Building
W. H. Matthias, Manager.

YOU pay a *little* more for our hardwood lumber than you do for many others', but it's worth *much* more.

With our modern and first-class equipment and expert operatives, we couldn't make bad lumber if we tried to, because the *quality* and *size* of our virgin tough mountain white ash, red birch, yellow poplar, buckeye, maple, red oak, cherry and basswood, averaging less than three logs to the thousand, and 95 per cent sixteen feet, is the best type of hardwood timber growth in the United States, and shows a larger percentage of *firsts*.

If you are a discriminating buyer, let's get acquainted.

"It is not what lumber costs you, so much as what you can get out of it, that decides its value for your work."

OUR OWN MANUFACTURE

**Something New
For Your Factory Floors**

Utility Joined With Economy

We are now manufacturing what we call a No. 2 Factory grade of Hardwood Flooring which can be used successfully in factory buildings where good wearing qualities rather than appearance are required. This Flooring is made from the hardest portion of the log, and while the Flooring shows the heart defect to a considerable extent, nevertheless it will wear with wonderful durability. It is "Rockhard" flooring at a rock bottom price.

It is 13/16 x 2 1/4" face, and the Flooring is kiln dried, hollow backed, bored, end matched, steel scraped and bundled.

Write us about it. This is a grade of Hardwood Flooring you should know about. Address MITCHELL BROTHERS COMPANY, Sales Department, CADILLAC, MICHIGAN.

A floor to adore

For thirty-three years Wilce's Hardwood Floor-
ing has been among the foremost on the market
and because it stands today "unequaled" is the
best evidence that its manufacturer has kept
abreast of modern methods and the advanced de-
mands of the trade. To convince yourself of the
above statements, try our polished surface floor-
ing, tongued and grooved, hollow backed, with
matched ends and holes for blind nailing—you'll
find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring
and how to care for it—also prices—and is free.

The T. Wilce Company

22nd and Throop Sts. CHICAGO, ILL.

You Ought to Be Advertising to Us

You buyers of hardwood lumber—the rank and file, at any rate—are doing more real work to get what you want than for some time; possibly it's because not so much dry, usable lumber is being offered as previously.

For that reason we might just discontinue advertising to you, and wait for your advertising, in the form of inquiries, to come to us. But we want you to remember, at this time when people are really looking for lumber, instead of salesman looking for consumers with the traditional microscope, that Louisville Hardwood Club service is just as valuable as ever, and probably a bit more so.

As we have pointed out before, when an item is scarce, it is pretty hard to find one concern, no matter how large, that can provide it in quantity. But where the joint resources of many, all of them big and well equipped to take care of the regular business of the trade, are available in filling a single order, it is certain that the business can be handled to the thorough satisfaction of the customer.

Think this over; and if you have been having trouble getting that car of thick plain oak, or good ash, or wide poplar, or whatever it happens to be, just dictate a letter to

HARDWOOD LUMBER **Memphis, Tenn.**

500 Copies Sold Within a Week After Prospectus Was Issued

Hardwood Record announces the issue on March 1, 1913, of an Authoritative Commercial and Scientific Book

American Forest Trees

By Henry H. Gibson, Editor Hardwood Record
Edited by Hu Maxwell, Wood Utilization Expert

The Work Involves:

First: A botanical description of the more than 300 species of American forest tree growth.

Second: A physical description of the wood of these species.

Third: A recital of the chief uses of all important American woods, together with suggestions of advantageously broadening their uses.

Fourth: Complete information concerning the range of growth of all varieties.

Fifth: Related trees are logically grouped according to families and spe-

cies; important species covered in substantial detail, and brief mention of the woods of minor importance.

Sixth: Scientific name of each tree is recited, as well as the various common names by which it is recognized in different parts of its range of growth.

Seventh: The properties of the various woods are carefully analyzed, particularly weight, hardness, stiffness, strength, elasticity, toughness, color, figure, and seasoning and lasting properties.

☞ The book will contain between 650 and 750 pages, will be printed on the best quality of enameled paper, and handsomely bound in half leather, dark green roan back and corners, with basket cloth sides, silk head-bands, gold stamping on the back, and gilt top.

☞ The work will be illustrated with more than 100 full-page pictures on plate paper in sepia, outlined in orange, from photographs, covering all the chief commercial varieties of virgin forest timber growing in the United States; and also with numerous engravings, from drawings and photographs, showing leaf and flower forms, etc.

☞ The price of the work is \$6.00, delivered by express or mail, and is sold only on subscription.

☞ An order blank, and a prospectus, showing the character of the paper, size of page and style of printing will be forwarded on application.

Review and Outlook

General Market Conditions

THE HARDWOOD MARKET remains without break in its distinct strength in nearly every variety, grade and thickness of hardwoods. Plain oak in all grades is easily the distinct leader both in values being secured and in demand. Stocks of both white and red oak in first hands, in shipping condition, are extremely meager. The leading producers of quartered white oak on the basis of recent analysis made of its holdings, find that the big producers, involving possibly a half of the stock held in first hands today, have less than ten million feet of quartered white oak in stock. A most liberal estimate of all quartered white oak in first hands in shipping shape today would be surely less than twenty million feet, which is certainly a reversal of stock form from the condition obtaining a year ago. Nearly all southern hardwoods are in equally low supply and almost as much in demand.

Owing to the wide spread of values between red and sap gum, the sap end of this product is in remarkably strong demand with very little dry stock to be secured. The price of sap gum is ranging below its intrinsic value, and it is more than likely that fully a five-dollar advance on saps will be secured to place the value on a corresponding plane with red gum within a very short time.

In the northern hardwoods this situation is about parallel with that existing in the South. Maple is holding its own well and there is such an insistent demand for birch that dry stocks are practically exhausted, and a good deal of lumber is sold in advance of the saw.

The trade in the softer of the hardwoods—poplar, basswood and cottonwood—is also reasonably active at a very fair scale of values.

When it is known that stocks in the hands of the jobbers and consumers still remain very low, it is a question where all the apparently necessary stock to take care of manufacturing enterprises is going to be secured for a considerable time to come.

The weather conditions in both the North and the South have been very unfavorable for getting in logs, and it will be sometime before logs can be secured in sufficient quantities to operate sawmills at their full capacity.

A good many conservative hardwood operators feel that there is a danger in the attainment of too high values on several items of hardwoods, and are advancing to their neighbors in the trade the suggestion that prices on especially short items should not be advanced any further, believing that eventually it will militate against a state of satisfactory demand.

The Trend of Dimension Conditions

IN THE ISSUE of January 25, HARDWOOD RECORD published an editorial review of observations covering estimated requirements of the hardwood consuming trade as gathered for the purpose of

compiling in the bulletin service covering such requirements. Further observations of reports coming in since then indicate what may be a mere coincidence or, on the other hand, a change in requirements of dimension stock. In a considerable number of cases, concerns listing dimension stock in hardwoods among their requirements have crossed out old dimensions and replaced them with dimensions which are considerably larger than those utilized in former years. This applies of course only to squares and stock of similar nature. As stated, this may merely be a coincidence, and it must be confessed that it is rather difficult to find any real reason for any such change in requirements. Letters addressed to concerns so changing their dimension stock requirements and also to large manufacturers of dimension have failed to establish any definite reason why dimension stock in larger sizes should be used during the coming year than formerly. One large dimension manufacturer, however, reports that for a long time he has not made anything to speak of smaller than inch and a half squares, and only a small amount of these. It may be that the dimension consumers are finding it relatively less expensive to buy dimension stock which they can rip at once to the exact required dimension than to buy squares cut exactly to meet their measurements.

The consensus of opinion, as expressed in communications from several large dimension manufacturers, indicates an extremely brisk demand for dimension material and in most instances the communications stated that increasingly favorable prices are being realized on dimension stock. This would indicate that the manufacture of dimension, as carried on by the limited number of concerns which have intelligently analyzed this branch of hardwood production, has been placed on the basis of a separate business, and it would further indicate that the consumer of dimension stock has come to realize that the difference in price between dimension lumber and ordinary stock is considerably less than the increased cost to him of re-manufacturing his entire stock from standard sizes of lumber.

Reforestation

A CAMPAIGN to effect reforestation in this country for the purpose of providing material for the future is being agitated by the National Implement and Vehicle Association, with headquarters in Chicago. The industries which are included in the membership of the association are large consumers of wood, and they are face to face with a situation which they regard as serious. They are still able to obtain material, but the most suitable kinds are becoming scarce, and in many instances the long hauls add so much cost that prices are nearly prohibitive. Different kinds of wood are brought together from every part of the United States.

The association recently addressed a letter to Gifford Pinchot, president of the National Conservation Association, suggesting that the

government should increase its activities in the way of reforestation, and that it should not only retain and plant what land it has now, but should enlarge its work to the extent of taking charge of planting in states where there now is little or no government land. The reason assigned for taking up the work in new fields is that the government is better able to do it, can work on a broader basis, and do it with greater economy.

The question is far-reaching, and there are certain dangerous shoals that must be avoided. Under existing laws, and in the present condition of public opinion, it is doubtful if the government could buy land for the purpose of growing timber. It can plant land which it owns, and it should do so, and doubtless will as rapidly as circumstances allow; but the buying of land and planting timber in states generally would meet opposition sufficient to defeat the purpose.

Fortunately, many of the states are earnestly at work along these lines. They are acquiring land and planting timber, and private owners are encouraged to do the same. Unquestionably, the bulk of timber planting in this country, except on government land, must be done by private owners. The states can offer encouragement in the way of fire protection, and in favorable tax laws. Many states are doing this, or attempting to do it. Active work is being done in many regions, under state laws and regulations. The actual planting of timber has not yet been undertaken on a large scale in many localities, but present interest in the subject will lead to practical results. There is no lack of good intentions, but good intentions alone will not suffice. There must be works as well as faith.

The Coming of the White Man

THERE IS ROOM for various interpretations of the illustration on the cover of *HARDWOOD RECORD* this issue. It is made from a photograph of a monument in a public park at Portland, Ore. The Indians are looking intently into the distance, but the object at which they are gazing is not shown in the illustration, and each person is left to decide for himself what it is they see—whether a hunter with his long rifle, of the type familiar to the readers of Cooper's novels; whether a covered wagon like the historic prairie schooners; whether the white sail of a boat approaching a shore or tacking slowly up the current of an inland river. The Indians in their native homes saw the white man come in all these ways and in many others. He came in peace, and he came in war; he came as a trader, as an explorer, as a missionary carrying a cross and a bible, and he came seeking protection from enemies, or refuge from starvation.

There are no two accounts of how the Indian received the white man who came in peace. He was received, as he asked to be received, in peace, and the Indian shared with him the best he had and all he had. Neither are there two accounts of the Indian's reception of the white man who came in war. He was received in war. The red man permitted none to surpass him in sacrifices for friends; nor could any surpass him in the ferocities of war. He was a man of extremes, and knew no middle course, and refused to learn any middle course.

The faces of the Indians have been given strong expressions by the sculptor. One seems inclined to welcome the coming stranger, but the other clearly intends to wait for further developments before he expresses himself. He proposes neither to advance nor retreat.

The illustration is supposed to be the Pacific coast Indian, looking eastward, for the white man came to that region overland, not by sea as along the Atlantic coast. Yet the physiognomy is typical. It would fit a Mohawk as well as a Modoc. It is the face of the forest man, the hunter, the fighter, the wild tribesman who once held dominion of the two continents, from the Pacific to the Atlantic, and from the Arctic shores to Terra del Fuego. He held it during untold ages, but he developed no resources, he built no ships, no cities, no highways; he opened no mines, erected no factories, and the coming of the white man marked the end of the reign of savagery and the beginning of civilization.

It has been erroneously supposed by many that forest destruction began with the white man's coming. The beginning was long before, and the Indian was the destroyer. There is reason to believe that

forests once extended west to the edge of the semi-arid region, say about to the one hundredth meridian. The destruction is laid to the Indian who used fire to open the wilderness and make pasturage for the buffalo. He had been burning for probably hundreds of years when the white man appeared on the scene. Most of the open prairies west of the Alleghany mountains, and particularly in the states of the Middle West, are believed to be the work of Indian fires. The burnings had reached the Atlantic coast when Europeans arrived. Nathaniel J. Shaler, in his book on "Man in North America," expresses the opinion that if the white man's coming had been delayed five hundred years he would have landed upon a treeless continent. The Indian would have burned everything that would burn; grass would have had possession wherever conditions would permit its growth; the buffalo and other herbivorous animals would have roamed the vast pastures in untold numbers; and the Indian would have been living by the chase alone, and would have ceased his attempts at primitive agriculture.

The coming of the white man was, therefore, a momentous event in the history of America. He checked the destruction of the finest forests in the world, and saved their remnants for the use of civilization. Without those forests, American civilization must have taken an entirely different course, and who can say that it would not have been hindered and in part defeated?

In this larger view, what is the meaning of the monument—the White Man's Coming? Is some glimmering dawn of the truth breaking on the Indian's proud soul and benighted intellect, and does the white man's appearance on the scene mean to the red man what the handwriting on the cornice of the feast hall of Babylon meant to Belshazzar—"Weighed, weighed, and found wanting"?

Lumbermen's Fire Insurance

THE EIGHTH ANNUAL REPORT of the Lumbermen's Underwriting Alliance of Kansas City, which was recently issued, calls attention to an important business arrangement formulated by the lumbermen for their mutual benefit. This is one of the insurance associations which in recent years have given lumbermen insurance at cost. Success has shown the wisdom of the plan. Losses are borne by all and profits and advantages are shared by all. It is as nearly mutual insurance as has yet been put in successful practice.

Among the good features of the plan is the keeping down of expenses to the lowest point consistent with efficiency. No dead load is carried. Nobody is paying for what he is not getting, and nobody gets what he does not pay for. Another good feature is the careful inspection of property to see that the proprietors incur no unnecessary risks. They must keep their premises in order, and take all reasonable precautions against danger of fire. By that means the losses are reduced to a minimum, and the cost of insurance is kept at the lowest point.

It can be said of the plan as a whole that it has been a success. It runs smoothly and attains the end desired. It has been worked out gradually, improved as experience has shown better ways, has been carefully brought up to its present state of efficiency, and as far as can be foreseen, it is a permanent business institution in this country.

The Government's Timber

THE DEMAND which is made in different parts of the country that the government sell its timber cheap, or give it away, in order that consumers may buy lumber cheap, is ill-advised. It means simply that the government ought to break the market and demoralize prices. Such a policy is ill-advised for two reasons: In the first place, there is no just reason why the lumber markets should be broken. The men engaged in the business are making no more than legitimate profits, and some of them not that. There are enough sawmills in the country to cut much more lumber than is being cut, and it stands to reason, if profits were large, those mills would be running at full capacity. That fact alone is sufficient answer to the charge that lumber is being sold for more than it is worth. In the second place, if the government should be so unbusiness-like as to attempt to upset the market by selling its timber for little, or giving it away, it is doubtful if it could accomplish that purpose.

It might give timber to contractors, but the contractors would simply accept the gift, and when they cut the timber, they would sell it at the market price, the same as lumbermen are doing now, and there is no reason to believe that the price would come down one cent. The government would be making a present of the timber to the contractors, not to the consumers.

Some critics of the government's timber policy go so far as to suggest that the United States should go into the lumber business, build mills, saw its own timber, and put it on the market at cost, selling it direct to the consumer when possible, and thereby "break the price." It is difficult to conceive that such a suggestion could be made in seriousness, for it would be revolutionary, destructive, and would inevitably defeat the end sought, which is cheap lumber for the consumer. Suppose, by way of argument, that such a thing were attempted. There is no question that the government could build mills, saw its own lumber, and throw it on the market in quantities and at figures which would drive competitors out of business temporarily; but it would be only temporarily. The government has not enough timber in reach of market to last long at that rate. It would quickly cut, deplete, and destroy all available government timber in the forest reserves. Meanwhile the owners of private timber would close their mills and wait for the era of foolishness to pass—and it would pass quickly. Then the private owners would have a monopoly. The government's timber would be gone, and competition from that source would be impossible. The owners would then have the market in their own hands, and the Forest Service would be powerless to sell timber or lumber at any price. There is good ground for suspicion that such is precisely what the critics of the government's timber policy would like to see—the Forest Service out of the way for all time.

The government last year sold 800,000,000 feet of timber for all purposes, lumber, mine props, posts, and fuel, at an average price of two dollars a thousand feet on the stump. That was not more than one per cent of the total forest products of the country. The sales were advertised extensively and the highest prices possible were obtained. There was no attempt to break or boost the market, but sales were made just as a conservative private owner would have made them. All Forest Service timber is not in reach of market at this time. Some of it could not now be given away, with the stipulation that it be cut and marketed, but there is no question that it could be given to speculators who would hold it for rise in value.

The time will come when the people of this country will fully appreciate the stand which the Forest Service is now taking to preserve timber for use in the future, as well as for conservative use in the present.

Weed Trees in the Woodlot

ALL THE WEEDS which lessen the value of crops are not those growing in gardens, wheatfields, and among the rows of corn. The forest has its weeds the same as fields have, but the unprofitable forest weed is not the nettle, lady slipper, spikenard, Indian turnip, snake root, and the hundreds of other animal plants which cover the ground in spring and summer and die in winter. There are trees which are as truly weeds as any that choke the crops which the farmer

plants. They are the trees which never grow into value, or grow so slowly that they are unprofitable; yet they demand as much space, as much nourishment, as much light, as the valuable species which increase rapidly in size and come to maturity quickly.

In the wild woods, where nature is the only forester, the weed trees are looked upon as unavoidable. The trees of all sizes, kinds, and conditions struggle for mastery, and it is sometimes a survival of the fittest, and sometimes it is not; but men accept what nature gives.

A new kind of forest is coming to the front in this country. It is known as the woodlot or "the farmer's woodlot," because it is usually a part of a farm. In the past forests of that kind have not been of much importance in this country, but they are going to be in the future. The natural forests, in their wild state, are passing, and in many of the older states they have practically ceased to exist; and local supplies of timber must come from woodlots.

Take Indiana as an example of a woodlot state. Originally that region contained some of the finest hardwood forests in the whole country. Several important species reached their highest development in the southern part of Indiana. Forests are now few and small; but in their place are farmers' woodlots aggregating four million acres in that one state. These lots are growing timber. The people who own them are not keeping them and paying taxes on them for sentimental reasons, but for profit. The men are growing timber for their own use, and also to sell—saw-logs, lumber, posts, and fuel. Similar conditions prevail in many of the old states, and will sometime prevail in practically all of the states.

It is not profitable to grow weed trees. The owners who look after their interests will not permit trees to occupy space, unless they promise profit. They should be cut out, and their room given to trees which make returns on the investment. More than five hundred kinds of trees grow naturally in the United States; but half of them are useless for timber purposes. The really profitable trees for woodlots scarcely number fifty. There is

no profit in growing a dogwood where a chestnut, basswood, or yellow poplar will grow, nor in permitting scrub pine to occupy ground where white pine might be growing.

The thinning of woodlots by removing the small, unpromising trees, and replanting vacant spaces with species which grow rapidly and produce valuable wood, will become the prevailing custom in the old sections of the country. There is no more profit in tree weeds than in the weeds which choke the field crops. The time to harvest the forest crop should be recognized as carefully as the time of corn harvest. Overmature timber is unprofitable, and to that extent, it is no less a weed than is the tree which is never large or fit for anything. Both should be removed to make room for trees which are capable of giving a good account of themselves.

High Water Mark Passed

AS HARDWOOD RECORD GOES TO PRESS, the high water mark at the lower Mississippi lumber points has just about been reached and in some instances a scarcely perceptible but actual recession of the water is noted. At all points along the Ohio the river has gotten down pretty near to normal for this time of the year and no further immediate trouble is anticipated at those points. In Arkansas unceasing rains have kept the country in a flooded condition

UNSOLICITED TESTIMONIAL

The Pyrono Process Company

Manufacturer of

Doors and Interior Finish

Columbus, O., January 7th, 1913.

HARDWOOD RECORD,
Chicago, Ill.

Gentlemen: We inclose herewith check for \$2.00 to cover subscription as noted in your bill of December 15th, which bill was mislaid on its arrival at the office and came to our notice only today.

We hope we shall not be compelled to miss any of the numbers of HARDWOOD RECORD, for we can say to you candidly that no periodical that comes to this office is considered of more value than HARDWOOD RECORD.

Very truly yours,

THE PYRONO PROCESS COMPANY,
David C. Meehan, Pres't.

and very seriously affected logging.

There is one feature of the flood situation which gives some measure of satisfaction and that is the fact that whenever there are two distinct flood periods in the first half of any calendar year, neither one of them is liable to be of extreme seriousness. The first flood stage seems to take the cap off of the second so that each reaches only a mean level.

It is anticipated that logging will be resumed again in the Arkansas territory in the near future. No notable damage has been done directly to the lumber business that amounts to anything comparatively, and there is no reason to fear future damage from high water.

What the Meeting Brought Out

LOOKING BACK to the meeting of the Hardwood Manufacturers' Association of the United States, held February 4 and 5 at Cincinnati, there are certain features which stand out above all others as distinguishing this particular convention. The absence of the usual entertainment features gave to the convention more of the tone of a business meeting than has heretofore prevailed. It must be admitted that the absence of such entertainment was noted by a number of those in attendance, but it cannot be said that it seriously affected their esteem for the association.

Viewing the convention proceedings from an increasing distance, the two most prominent things which strike the observer are the fact that there was a representative attendance covering practically the entire hardwood producing and stumpage covered sections of the country. Among the 500 present could be found manufacturers and timber owners coming from every region of importance to the hardwood industry of the United States. This alone, according to competent observers, presages future good for the association.

While the representative attendance was a feature of which those in charge of the convention can be justly proud, there were other things noticeable which augur equally well for the association's future. It was a noticeable fact that a great many large operators and timberland owners who have for years passed up hardwood lumber conventions were in attendance during the two days' sessions. Not alone did their presence support the association in a moral way, but their counsel and suggestions made the resulting proceedings of unusual value.

Too much credit cannot be given to the administration of the re-elected president, W. E. DeLaney. Mr. DeLaney has given the full benefit of a forceful and far-sighted personality and has entered heart and soul into the association work. His administration has been aggressive and progressive and has accomplished more direct good than the membership could realize by mere attendance at the convention sessions. The purport of what he has done will be realized only after the members have had time to reflect upon and digest the proceedings at Cincinnati. The fact that President DeLaney was compelled to accept the office of president for another term, against his expressed wishes, is a fair indication of the regard with which his administration has been viewed.

The Consumer Needs Education

THE QUESTION was recently advanced by an official of one of the largest electric machinery and appliances manufacturers in the country, as to the adaptability of a certain species of wood for a particular purpose. The wood in question was maple and it was used in large squares in connection with the manufacture of transformers of excessively high voltage. The conversation on this subject was opened with a statement by the official that several years of experimentation in order to determine the proper way of handling the squares, still found the company undecided as to exactly how to get the best out of this material.

The squares were formerly bought in size of 5x6 up to 8x8, but it was ultimately found entirely impractical and too expensive to purchase anything larger than 5x5 and 5x6.

It does not speak well for the lumberman who first sold these maple squares to this particular concern when one considers the statement that when this concern first started to use the material it believed that it could get the desired results by simply putting the squares into a

dry-kiln and rushing them for twenty-four hours. The idea is to dry thoroughly, after which the squares are immersed in a vat of superheated oil and then utilized.

The point of this editorial is the fact that the average consumer of forest products understands very little as to the proper utilization of what he buys. The manufacturer and wholesaler should hence make every possible suggestion that will enable the buyer of his goods to get the most satisfactory results from the wood that he uses. Otherwise he is going to change from one wood to another and perhaps eventually swerve to a substitute for wood.

This particular instance is a striking example of the lack of knowledge of wood physics on the part of such enormous buyers of wood as the concern in mind. The statement that after two years' work it is still having all kinds of trouble and experiencing an enormous waste of material is pretty conclusive proof that it needs education.

Getting back to the actual cause of the trouble, the official made the statement that the prime essential of the squares for the purpose for which they are intended is absolute dryness. He said that the company is now storing squares for six months under shed and then drying in a kiln, after which they are put into the oil bath. Imagine trying to thoroughly dry a 5x6 maple square in six months, particularly when a mere suggestion of moisture will result in the electricity gouging a hole completely through the square. It seems strange that the man who sold and is selling this company its squares could not have suggested that it buy them two, four or five years ahead and pile them, thus insuring complete dryness. This is merely one of those little things that the lumberman sometimes overlooks.

Car Conditions February First

A REPORT from the American Railway Association dated February 7 contains a statement of car surplus and shortage on February 1, with a comparative summary from October 25, 1911.

The total surplus February 1, 1913, was 62,045 cars; on January 15, 1913, the surplus was 53,230 cars; on January 31, 1912, the surplus was 55,592 cars.

The total shortage February 1, 1913, was 24,785 cars; on January 15, 1913, the shortage was 24,791, while on January 31, 1912, the shortage was 23,011.

Compared with the preceding period, there is an increase in the total surplus of 8,815 cars. Compared with the same date of 1912, there is an increase in the total surplus of 6,453 cars and an increase in the total shortage of 1,774 cars.

A Worthy Suggestion

A PLAN promulgated some time ago but outlined in detail in a letter read before the Hardwood Manufacturers' Association convention at Cincinnati last week, should, if it materializes, simplify the dimension stock business and put it on a basis that will insure profit to the dimension manufacturer.

The chief difficulty in making dimension stock at a profit has been the fact that it has been manufactured mainly from waste accumulation, and hence it was impossible to maintain stocks of any size. Further, if the manufacture of dimension were attempted by a concern doing nothing but this, the variation and lack of uniformity in dimension requirements would prohibit the piling up of sizes to any extent.

The suggestion would provide for a department of the Hardwood Manufacturers' Association, which would act as the selling agent for all members manufacturing dimension stock. This department would maintain a corps of men who would give close supervision to the manufacture of dimension at the different mills. It would also use its best efforts to standardize the sizes required by the consumers. Thus it would be possible to provide for the manufacture of sufficient stock ahead to take care of any order.

The difficulty in the past has been that many times orders have had to be refused because insufficient stocks made it impossible to fill them. With the proposed new scheme of things, however, the selling department maintained by the association would have the call on all dimension accumulations at the different mills, and furthermore, the mills could carry standard sizes in stock.

A LOGICAL APPREHENSION

A Million More

Patient—"You're a fraud! You guaranteed your medicine to cure after everything else failed, and——"

Medicine Man—"Well, probably you haven't tried everything else."

Not Wet Enough

Lambert Caspers, a Chicago attorney, told this story at a recent Y. M. C. A. banquet:

A Kansas farmer, a Dane, applied for naturalization papers. The judge asked him:

"Are you satisfied with the general conditions of the country?"

"Yes," drawled the Dane.

"Does the government suit you?" queried the judge.

"Yes, yes; only I would like to see more rain," replied the farmer.—*Judge*.

The Proper Head

Husband (studying his wife's accounts)—
"There are several items you haven't entered here. Doing up the furniture, your hairdresser, dentist, trip to the sea, for instance."

Wife—"Oh, those all come under the head of 'repairs.'"—*Fliegende Blatter*.

Getting Her on Record

"Am I the only man you ever loved?" he asked.

"Yes," she sighed.

"There is no rich man whom you ever cared to marry?" he persisted.

"No rich man I would marry," she said.

"Or no rich man you might marry if you chose?"

"No, but why do you ask these questions?"

"I just want to get you on record before our wedding so that afterward you won't be forever pointing out wealthy men to me as samples of what you might have had."—*Detroit Free Press*

American Forest Trees

ONE HUNDRED-FIFTH PAPER

BLACK COTTONWOOD

(*Populus Trichocarpa*—Torr. and Gr.)

This member of the cottonwood group is a strong tree that holds its ground in various latitudes and at many elevations, ranging from sea level up to eight or nine thousand feet, and in latitude from Alaska to southern California, a distance of nearly three thousand miles. Its east and west extension is more restricted and seldom exceeds four hundred miles. Its habitat covers an area of half a million square miles, and in that space it finds conditions which vary so greatly that the tree which can meet them must possess remarkable powers of adaptation.

Beginning in Alaska and the interior of Yukon territory, it has an arctic climate. It there not only grows on the coast, but it strikes the interior. It appears on the headwaters of several streams which flow into the Mackenzie or Hudson bay. It passes south through British Columbia and enters the United States west of the Rocky mountains. It has been reported as far east as Idaho and Montana, but further information is needed before its limits in that direction can be definitely fixed.

When it enters California it prefers the elevated valleys and canyons of the Sierra Nevadas, though it occurs sparingly among the coast ranges. It is generally found in the Sierras at elevations of from 3,000 to 6,000 feet, though it occurs between 8,000 and 9,000. Among the San Jacinto mountains of southern California it grows at an altitude of 6,000 feet.

When it occurs at low levels it is usually found on river bottoms and sand bars, in sandy and humous soils, and there the largest trees are found. At higher elevations it is more apt to occur in canyon bottoms and gulches, in moist, sandy or gravelly soil, and in such situations the black cottonwood is smaller. The best growth occurs where the climate is humid and the precipitation is great. Beyond the reach of sea fogs, where the tree depends on soil moisture chiefly, it is smaller.

It is an intolerant tree. It must have light. When it is crowded a tall, slender trunk is developed and the small crown is lifted clear above its competitors into the full light.

If it cannot succeed in gaining that position its growth is stunted or the tree meets an early death.

The black cottonwood is the greatest of the cottonwoods. This country produces no other to match it, and, as far as known, the whole world has none. The Pacific coast is remarkable for the giant trees it produces, but most of them are softwoods—the redwoods, the big tree, the sugar pine, Douglas fir, western larch, noble fir, Sitka spruce and western red cedar. This cottonwood is the largest of the Pacific coast hardwoods. In trunk diameter it is excelled by the

weeping oak in the interior valleys of California, but when both height and diameter are considered, the black cottonwood is in the West what yellow poplar is in the East, the largest of the hardwoods.

Sargent says this tree reaches a height of two hundred feet and a diameter of eight, but Sudworth is more conservative and places the trunk limit at six feet. The average size is much below the figures

given, but abundance of logs exceeding three feet in diameter reach the sawmills of Washington and Oregon.

Old trees range from 150 to 200 years in age, but trees under 100 years old are large enough for saw timber. Records of the ages of the largest trunks have not been reported.

Black cottonwood is a prolific seeder, but the seeds do not long retain their vitality. If they find lodgment in damp situations, where other conditions are favorable, the rate of germination is high. Seedlings are often very numerous on wet bars.

The excellent quality of the wood and its suitability for many purposes bring it much demand on the Pacific coast. In the state of Washington more than 30,000,000 feet were used by wood-using industries in 1910. Smaller quantities were reported in Oregon and California.

In strength the wood is approximately the same as common cottonwood, but in stiffness it much exceeds the eastern species. Its elasticity rates high, and compares favorably with some of the valuable eastern hardwoods. In weight it is slightly under common cottonwood. Trees are of fine form, nearly always straight, and are generally free from limbs to a considerable height.

The wood is grayish white, soft, tough, odorless, tasteless, long-fibered, nails well, is easily glued and cuts into excellent rotary veneer with comparatively small expenditure of power. It does not split easily after it has undergone seasoning, and this property commends it to boxmakers. It is little disposed to shrink and swell in atmospheric changes. The absence of odor

and taste gives it much of its value for box making, because foods are not contaminated by contact with the wood.

It is manufactured into veneer berry baskets and is one of the most suitable woods on the Pacific coast for that purpose. Candy barrel makers use it in preference to most others, and a long line of woodenware articles draw much of their material from this source. Many thousands of cords are cut yearly for the pulp mills, where material for paper is produced. Black cottonwood and white fir are the principal woods used for pulp on the Pacific coast.

FOREST GROWTH BLACK COTTONWOOD. CHELAN COUNTY, WASHINGTON

Not only is it used for rotary-cut veneer, but it is made into cores or backing on which veneers of costly woods are glued in the manufacture of furniture, interior finish and fixtures for banks, stores and offices. It serves in the same way in casket making, and is demanded in millions of feet.

It is employed in amounts larger than any other wood by excelsior mills in the northern Pacific coast region. It is the only wood demanded by that industry in Washington and 6,400,000 feet were cut into that product in 1910.

Slack coopers find it as valuable in their business in the far West as the common cottonwood in the East, and hundreds of thousands of staves are made yearly. It is in demand for the manufacture of flour barrels and those intended for other food products.

Trunk makers use it in three-ply veneers for the bodies, trays, boxes and compartments of trunks and for suit cases. Though soft and light, it is very tough, and sheets of veneer with the grains placed transversely resist strains much better than solid wood of the same thickness.

Vehicle makers employ black cottonwood for the tops and shelves of business wagons. Another of its uses is as bottoms of drawers for

bureaus, wardrobes and chiffoniers and as partitions in desk compartments. A full line of kitchen and pantry furniture is made wholly or in part of this wood in the regions where it is cheap and abundant.

The cottonwoods belong to a very ancient race of broadleaf trees, and like several others, they seem to have had their origin, or at least a very early home, in the far North, where intense cold now excludes almost every form of vegetable growth except the lowest orders. The Cretaceous age saw cottonwoods growing in Greenland. The cotton which then, as now, carried the seeds and planted them fell on more hospitable shores than can now be found in the far frozen North. The genus was not confined to the arctic and subarctic regions, however, for there were cottonwoods at that time, or later, in more southern latitudes. There were many species in the central portion of this country, and also in Europe, long before the ice age destroyed all the forests north of the Ohio and the Missouri rivers. Some of the old species long ago ceased to exist, but others appear to have come down to the present time without great change.

The cottonwood shows wonderful vitality, which is doubtless a survival of the characteristic which enabled it to come down from former geologic epochs to the present time. A damaged and mutilated tree will recover. A broken limb, thrust in the ground, will grow.

Canadian Rate Hearing at Cincinnati

Lumbermen expect to see a large advantage gained in the controversy over the proposed Canadian rate advancement as a result of the developments at the final hearing of the testimony before Interstate Commerce Commissioner Balhazar Meyer, at the Federal building, Cincinnati, January 24 and 25.

The testimony presented by the many witnesses showed conclusively that Canadian receivers of lumber are distinctly opposed to the advancement in tariffs.

Another valuable point scored by the lumbermen was the favorable construction placed by the commissioner on the demand, through the attorneys for the shippers, that complete records of data before the freight associations' meetings be produced before the commission.

Commissioner Meyer announced that the brief of the railroad must be filed with the commission on or before February 25, and the briefs of the contesting shippers within fifteen days thereafter. He stated that other arguments would be heard before the commission in Washington in the second week of March, providing the calendar of the commission would permit.

The proposed rate increases, which it is estimated would increase the cost of hardwood and southern pine to Canadian points east of Detroit by one dollar to two-and-a-half dollars a thousand feet, were published by the railroads prior to September 1, 1912. On that date the commission, acting on protest by lumbermen, suspended the tariff until September, but at the conclusion of the suspension period the suspension was continued until June 30, 1913.

Lumbermen at points south of Ohio river crossings claim that the increased tariff would practically ruin the export business of southern lumber manufacturers to Canadian points. Representatives of the trade from Memphis, St. Louis, New Orleans and Arkansas points were present, there being an even dozen of outside lumbermen in attendance. Other interests represented were Canadian associations, International Harvester Company, manufacturers of the furniture section of the Canada Manufacturers' Association of Toronto.

Walter Wellford of Memphis was the first witness at the opening session. In testifying for the coopers' business he said that ninety-five per cent of the staves sent to Canada are shipped to points east of Detroit. He testified that railroads are now asking more money per unit than they did ten years ago, and that improved equipment and increased speed permits them to turn even a greater profit than formerly. This testimony was offered in order to show the raise is not a necessity to return a profit to the railroad company.

E. E. Eversull, traffic manager of the W. T. Ferguson Lumber Company of St. Louis, was the next witness. This company has mills in

Louisiana and Texas. The witness produced letters from various individuals and firms interested in the advance, which tended to show such advances would work a material and lasting hardship on the industries affected. Mr. Eversull stated that yellow pine men will have to cut prices on yellow pine on Canadian deliveries about \$2.50 per thousand or get out of the Canadian business if these advances go into effect, as the competition from fir lumber will tend to make this change necessary. He stated that all rates from southwestern territory are based on Cairo.

B. M. Krebs, manager of the McLean Hardwood Lumber Company of Memphis, Tenn., was then called. Mr. Krebs showed that of fifty-two points in Canadian territory that would be affected by the change, three were lowered and the balance raised. Mr. Krebs offered many letters from Canadian receivers of lumber stating that they were decidedly opposed to the intended advances. His testimony was for the purpose of showing that the advances are merely with a view of increasing the revenue for Canadian lines, and not for the purpose of equalizing rates, as Mr. Martin, representing the roads, stated at the St. Louis meeting. The matter was debated by these two gentlemen.

Frank Robertson of the Anderson-Tully Company of Memphis was the first witness in the afternoon session. Mr. Robertson said that if the advances went into effect the southern manufacturers would be seriously crippled in their efforts to secure Canadian trade and would likely be shut out entirely. He stated that the lumber thus barred from Canadian points would necessarily have to be marketed locally, with the resultant demoralization of the general lumber business.

J. H. Townsend, traffic manager of the Southern Hardwood Traffic Bureau of Memphis, Tenn., followed Mr. Robertson and read a statement showing that the proposed advances would affect four hundred Canadian points.

T. A. Sledge of May Brothers, Memphis, read a number of letters of protest from all sections of the southern shipping territory.

J. J. Bruner of the E. Sondheimer Company of Memphis declared that the real reason for the advance was that the Canadian lines had attempted to secure additional revenue as their proportion of the through rate, and not having been successful in obtaining it from connecting lines took the initiative in agitating increased rates. Mr. Bruner said that he could substantiate his statement by giving the source of the information.

J. D. Allen, Jr., of the Darnell-Taenzer Lumber Company, Memphis, Tenn., reviewed the many new developments in the lumber busi-

ness with which the lumber manufacturer has had to contend as the years have gone by. He stated that further increase of Canadian rates was entirely unjust and would work a distinct hardship.

Elliott Lang of R. J. Darnell, Inc., Memphis, testified against the attitude of the railroad representatives to show that the amount of lumber shipped to Canadian points was limited. He claimed that if this export business were shut off, as it undoubtedly would be if the advances in rates were sustained, it would have the tendency to throw a lot of the millwork now going into that territory onto the American markets. Mr. Lang laid particular stress upon the increased cost of stumping and operation to the sawmill men.

Mr. Lang again took the stand for the Friday night session, but was shortly excused and was followed by Philip B. Gordon of Montreal, who stated that his business is principally in yellow pine and fir timber. Mr. Gordon said that the high rail rates are responsible for the increased cargo shipments of pine to Canadian points. He said that this water transportation will undoubtedly increase during the coming year. Mr. Gordon, in speaking for Canadian consumers, said that if the advances went into effect they would undoubtedly exclude pine from the Canadian markets in favor of western fir. He further said that Canadians are distinctly opposed to the advances.

Mr. Gordon gave the longest testimony of any of the witnesses and his testimony made a very favorable impression upon the commissioner. The railroad representatives failed in every instance to confuse or to disprove his statement.

H. C. Martin, general freight agent of the Grand Trunk line, opened Saturday morning's session. He offered some interesting statistics, showing shipments to Canadian points from connecting lines in the United States. It was noted that many of the cars shown in the statement were principally for railroad material.

Mr. Martin was followed by J. P. Pattendorf, general freight agent for the Illinois Central Railroad at Memphis, Tenn. He showed the Illinois Central's portion of the through rates and also the variation in proportions where railroads gained in one place and lost in another. He then stated that the old custom of fifty years ago, when all rates terminated at Ohio river crossings, might be acceptable to many lines.

A general discussion followed among the attorneys. Attorney Wolter insisted upon a definite reply from the railroad representation as to whether or not they would comply with his request to produce the complete records of the meeting of the Canadian Freight Association, Central Freight Association, Southwestern Lines Association, Mississippi Valley Association and the Southeastern Association.

Mr. Martin, in speaking for the railroads he represented, said that he could not speak for other lines, but that as far as he was concerned he would decline to furnish any such data, as it was not public property.

Judge Moore, also representing the roads, stated that he would confer immediately with his clients and that he had no doubt that the information desired would be cheerfully given, especially if the commission so ruled. He stated that, in his opinion, the commission had the right to demand such papers.

Commissioner Meyer stated that inasmuch as these records may assist the commission they might be valuable to it, but he did not wish to take the responsibility of ordering them produced without first conferring with his colleagues at Washington. He then ordered the railroad representatives to prepare their briefs and have them filed with the commission in thirty days, and the shippers to file theirs within fifteen days after.

Universal Names Needed for Trees

The number of commercial woods imported into this country is much larger than is generally supposed by those who have not looked into the subject. A study of the kinds of useful and ornamental timbers shipped into the United States is not only an interesting, but at the same time a very difficult undertaking. Foreign woods are enumerated in the official trade returns as coming under the following classification of common or trade names: Mahogany, cedar, rosewood, satinwood, lignum-vitæ, ebony, boxwood, granadillo, lancewood, logwood, and fustic. The bulk of the woods which are now imported are entered under the above names. There are, however, many other woods which are shipped into this country only in small quantities.

Practically all timber merchants put a great deal of reliance or high value on common names. A little knowledge of the timber trade will soon convince the thoughtful inquirer that there are no less than fifty entirely different woods known as mahogany, and equally as many called cedar. The commercial name has a relation merely to the physical appearances or characters of the woods or to the country from which the wood was shipped. A good many woods having only a remote resemblance to mahogany are often sold as mahogany. Lagos, Benin, Nicaragua, Brazil, and Panama wood are named after the country from which they originate. Then again there are names which are very general in their application, as for instance "madeira," which means wood, and is sometimes applied in the trade to mahogany, tamarind, etc. In the East Indies the word "poon" is a name given by many of the tribes or nations to any tree. The early traders who heard the name "poon" applied to the particularly noted tree (*Calophyllum inophyllum*) in the East Indies at once concluded that this was its regularly accepted common name. Later other traders heard the name applied to entirely different trees and today a number of unrelated species are called "poon."

While such names are sometimes helpful in tracing down the true name of the wood, one must not put too much reliance on them. The names given to trees by the uneducated people are at best very uncertain and fluctuating. This is often true even in civilized countries,

as in the United States, where a single tree sometimes has a dozen or more common or local names. On the other hand, the same name is frequently applied to more than one species of trees. There are in this country no less than six genera whose woods are called cedars. Lately the substitution of inferior wood for better kinds has been practiced so extensively that a number of the recently introduced woods have been given the names of the woods for which they are being substituted. A good example of this is the okoume (*Boswellia klainea*) of West Africa, which is used in place of the Spanish cedar for making cigar boxes, and is now commonly known as cedar.

A great many of the native names of trees of foreign countries are constantly being changed or corrupted by travelers, who have merely run through a region as collectors and are not familiar with the language. This is true particularly in Latin America, where a good many Indian and Spanish names have been so corrupted that it is difficult to recognize them in print. Sncopira, sebupira, sepepera, and sepibira (*Boudichia virgilioides*) illustrate this case and show that there is an entire lack of rule in spelling these native names. The Indians of tropical America, for instance, have no rule for nomenclature, and they have no means of producing a uniformity of names and very frequently confound one name with another. The reliance on these names very often leads to mistakes, instead of proving an aid, in tracing down the botanical name of commercial wood unless one is well acquainted with the wood structure of the different groups of trees. Owing to very different woods having the same common names, occasionally very serious mistakes originate by erroneously substituting a wood when one of an opposite kind was intended. This is frequently the case with respect to our southern pines. Both the loblolly and longleaf pines are called longleaf pine in certain localities. The substitution of loblolly for the more durable longleaf has frequently resulted in very serious losses. An effort should be made to determine upon a commercial name for each important wood, and if such a nomenclature would be followed by all dealers the number of errors would be greatly reduced. L. L. D.

Annual of Wisconsin Manufacturers

The fourth annual meeting of the Northern Hemlock and Hardwood Manufacturers' Association was called to order the morning of Wednesday, January 29, at the Hotel Pfister, Milwaukee, Wis., by President E. A. Hamar.

After the roll call and reading of the minutes of the previous meeting, President Hamar delivered his address.

The president told of the change in the inspection department whereby the headquarters of the chief inspector were moved to the Wausau office, while the number of inspectors was reduced from three to two. By making these changes the association finished the year 1912 with an excellent balance on hand.

President Hamar thanked the members of the various committees for their assistance during the past year. In outlining the work done by the various committees, he said that the grading rules committee had recommended a new set of rules for the grading of hemlock. He stated that the old rules were obsolete and needed revision, and that he endorsed the committee's efforts and recommended that the rules it submits be favorably acted upon.

He reviewed the work of the advertising campaign on hemlock and birch, and said that it has already been demonstrated that it is a work that should be continued and followed up. According to the speaker, the secretary's office is daily receiving inquiries from architects and builders, which inquiries are the direct result of the advertising.

The speaker recommended that in the future members of the committee should be allowed expenses incurred in gathering for committee meetings. While this question was covered in a provision of the by-laws the committeemen have never taken advantage of it.

In speaking of the proposed Forest Products Exposition, President Hamar stated that he would like to see action taken on any method by which lumbermen could give further assistance in getting the exposition started. He stated that it is poor business policy for lumber manufacturers to remain inert while cement, brick and patent roofing manufacturers hold their exposition and gain the resulting advertising.

President Hamar said that 1912 had been a fairly satisfactory year and that the indications are that 1913 will be a year of prosperity.

The report of the treasurer followed the address of President Hamar. It showed a balance on hand January 29, 1913, \$169.11; received from secretary during the year, \$22,587.10, making a total of \$22,756.21; vouchers paid aggregated \$19,469.50, leaving a balance on hand January 27, 1913, \$3,286.71.

Secretary Kellogg, in his report, reviewed the past year's work of the association and of the members of the various committees, stating that it was one of prosperity for the association. He thanked the committee members very heartily for their co-operation.

In speaking of statistics for the year, the secretary said that at this time in 1912 reports indicated an increase of 10 per cent of stock on hand in comparison with January 1, 1911. On the other hand, there has been approximately 35 per cent decrease in stocks during the past year, while in the stock on hand unsold the decrease is even greater.

In hardwoods, decreases in stock on hand unsold were 78 per cent for ash, 37 per cent basswood, 30 per cent birch, 63 per cent rock elm, 60 per cent soft elm, 28 per cent hard maple, 67 per cent soft maple and 22 per cent oak, an average of 38 per cent decrease in hardwood stocks on hand unsold during the year 1912.

E. A. HAMAR, CHASSELL NICHOL, PRESIDENT OF THE NORTHERN HEMLOCK AND HARDWOOD MANUFACTURERS' ASSOCIATION

Shipments of hemlock and hardwoods by association members during 1912 were over 200,000,000 feet in excess of 1911. This increase in shipment and decrease in production is what brought about the general scarcity of northern stocks on hand today.

The secretary said further that as the winter advances it becomes increasingly evident that there is little possibility of the log-input this year being as great as the log-input of last year, so that whatever takes place it is hard to figure out any chance of lumber stocks getting back to normal within the next year.

In looking ahead for the coming year, the secretary said that many contracts already made will result in a profit if it is possible to get logs, and other contracts just as good are being made every day. Consequently the trouble for the lumbermen this year is of an entirely different character than all their troubles were in 1908, 1909, 1910 and 1911.

Chairman W. G. Collar of the railroad committee then submitted his report. The report touched upon the complaint of the paper men to the railroad commissioner, of the unjust discrimination in freight rates on logs des-

tined to be manufactured into lumber and logs to be manufactured into paper. When notice of complaint was served on the railroad they asked the railroad commission to have the association made a party to the hearing, and the railroad commission accordingly notified Secretary Kellogg that association representatives would be expected to appear at Madison on a specified date to discuss the rates on logs from the woods to the mill.

Preceding the hearing log shippers of Wisconsin met in conference with the railroad men at Chicago and were assured by the railroad representatives that they were willing to let the log rates stand, but that if the commission decided the rates showed unjust discrimination it would be necessary to raise the log rate to the rate on cordwood and bolts and pulpwood. This, of course, would have worked a considerable hardship on the sawmill men and seriously militate against their profits. The report stated that the commission still had the matter under consideration, but that a favorable opinion was anticipated.

Another matter discussed in the report was the question of milling-in-transit and the amending of rule 76A as promulgated by the Interstate Commerce Commission. Mr. Collar said that he was present at the hearing at Washington, December 30. Mr. Collar said he tried to convince the commission that it was impossible to move saw-logs from the woods to the mills, manufacture them into lumber and ship the product in less than eighteen months, and that sawmill men should have two years in which to do the work.

Chairman Collar said that from the arguments the general impression was that the commission would take favorable action, but stated that the association should keep closely in touch with the conditions and that when an opinion is handed down the railroad committee, together with a traffic man, confer with the traffic committee of the Wisconsin roads and see that a new tariff is so made as to protect the lumber interests.

Mr. Collar told of a conference while in Washington with Mr. Belknap, the safety appliance expert of the Interstate Commerce Commission, in which the matter of hand brakes on log cars was brought up. Mr. Belknap informed Mr. Collar that Senator Stephenson of Wisconsin has introduced a bill to amend the law known as S-507, which new bill will provide that hand brakes are not essential on flat cars used for logging purposes.

Chairman Collar reported that the State Railroad Commission had

handed down a decision on pulpwood rate case on January 27, reducing the rates on pulpwood as follows:

For five miles, from 1.5 cents to 1.35 cents; 10 miles, 1.64 cents to 1.45 cents; 100 miles, 3.75 cents to 3.05 cents; 300 miles, 6.75 cents to 5.10 cents. Other rates will probably be proportionate.

Chairman W. A. Holt of the legislative committee had no formal report to make, but said that the lumber interests should have more attention at Madison, Wis., the state capital.

The report of the advertising committee as read by Chairman M. P. McCullough outlined the work during the year.

The advertising campaign began the first of October and replies have been far more profuse and of better character than was anticipated. Each month has shown an increase over the preceding month, thus indicating the cumulative value of good publicity. Up to the end of January the secretary received approximately 1,000 direct answers to birch and hemlock advertisements, most of which asked for either the hemlock or the birch bulletin, or both. Practically all of the inquiries came from concerns or individuals who were actually interested in purchasing or recommending either birch or hemlock. Approximately 2,000 names of lumber dealers have been furnished by members of the association to whom have been sent copies of the hemlock books, together with proper explanatory letter. Many of these dealers have asked for additional copies of the book for distribution among their customers, and have also asked for a list of the association members.

The demand for the birch books was so heavy that the original edition of 1,500 copies was exhausted and the committee took the responsibility of ordering another thousand. The amount expended to date of meeting was \$3,030.80. The committee estimated that to carry the work to the end of March would cost less than \$1,000.

The report said further that the only case in which the committee had exceeded the limits of its original estimate of the cost of the campaign was caused by a larger number of inquiries than were expected. In other words, this meant that the success was greater than the committee dared anticipate.

In conclusion, the report stated that, basing estimate upon the experience already gained, it is believed that a succeeding campaign can be made even more effective than the present one, and it recommended continuance of well placed association advertising as one of the most important means of maintaining and extending the market for products of the association.

After the appointment of committees on reports, nominations and grading, J. E. Rhodes, the newly-elected secretary and manager of the National Lumber Manufacturers' Association, addressed the meeting. He reviewed the hemlock conditions and said that conditions in the hemlock market are better than at any time in the history of the business. He recounted his recent travels and said that everywhere he had encountered the best prices, demand and general tone of trade in his memory. Mr. Rhodes said that the highest point of yellow pine production was passed in 1909, when the production was 16,000,000,000 feet, and that with the decrease which is bound to come in the ensuing years hemlock will show a corresponding strengthening. He said that great prosperity in the South will mean a local consumption of pine and hence a broadened market for hemlock in the northern points.

In speaking of his trip to Washington, D. C., on January 13, in the interest of the lumber trade, in the matter of tariff reduction, Mr. Rhodes said that there is every indication that the coming Congress will start on a one-billion-dollar basis and must retain at least a protective tariff. He said that inasmuch as lumber carries a less ad valorem rate than any other commodity—less than ten per cent—there is little likelihood of this tariff being removed or reduced. He said that he anticipated that with increase in stumpage prices the people will continuously demand a greater voice in the handling of future lumber crops. He said that lumbermen must participate in the forestry movement and co-operate with the conservation movement, or they will have to take the consequences in the matter of legislation.

J. C. Knox, secretary of the Michigan Hardwood Manufacturers' Association, talked for a few minutes and stated that conditions in Michigan and Wisconsin were very similar. He reviewed the meetings in the interests of the grading rule changes, and read figures of cut

and shipments for Michigan points. He predicted a smaller input of logs in Michigan during the ensuing winter than occurred last winter.

The meeting then adjourned until two o'clock.

The afternoon session was opened by a report of the bureau of grades submitted by M. J. Quinlan, chairman. The report stated that Rule 2 of the by-laws says that the grading rules committee has full authority to make any changes or new grading rules and that action by the association is not required. He said that at the meeting of the committee at Green Bay, December 19, the chief question proposed was that of cutting hemlock to yellow pine sizes. After a thorough canvass by mail the committee recommended that no change be made in hemlock sizes.

The No. 4 grade hemlock stock was also discussed. The report went into detail as to this new grade, which was recommended and adopted by the grading rules committee, and will henceforth be part of the hemlock grading rules of the association. Details of the new rules can be secured by writing to Secretary R. S. Kellogg.

The nominating committee then reported the recommendations for the following officers for the ensuing year:

PRESIDENT, E. A. Hamar, C. H. Worcester Lumber Company, Chassell, Mich.

VICE-PRESIDENT, R. B. Goodman, Goodman Lumber Company, Goodman, Wis.

SECRETARY, R. S. Kellogg, Wausau, Wis.

TREASURER, George Foster, Foster-Latimer Lumber Company, Mellen, Wis.

DIRECTORS to take place of directors retiring: W. C. Landon, J. J. Lingle, A. R. Week and A. C. Wells.

The nominating committee reported the following for bureau of grades and information: M. J. Quinlan, M. J. Fox, C. A. Goodman, R. M. Harder, A. R. Owen and J. J. Ott.

Both officers and directors were unanimously elected.

The recommendations committee recommended, among other things, an assessment for advertising for 1913, of not to exceed one-half cent per thousand feet cut, the aggregate assessment not to be over \$4,000; any extra assessment to come from the general fund.

Among the new business, the car stake question as introduced by W. C. Landon caused considerable discussion. Mr. Landon said that two years ago the Chicago & North Western Railroad Company took off bunks and chains from all flat cars and that on new cars it is putting nothing in place of such bunks and chains for logging service. The Chicago, Milwaukee & St. Paul Railroad Company is now following a similar course.

Mr. Landon said that the question should have come up at the time these changes were started. He further said that rates on log shipments were based on specially equipped cars, and that it is not fair to force the shipper of logs to pay for his own equipment for stakes and chains. Mr. Landon said that the companies putting on their own patent stakes will eventually be forced to remove them.

The Wisconsin Industrial Commission submitted the question to the Wisconsin State Railroad Commission and the two commissions are now working out the question jointly. He said that with proper co-operation on the part of the lumbermen an order will result compelling the railroads to equip all logging cars with patent stakes.

G. H. Chapman said that in the near future all roads handling logs on cars will be forced to equip cars with permanent stakes. He said that patent stakes tipping from the off-side are dangerous and that experience has demonstrated that stakes tipping from the end are the safest.

W. C. Landon made a motion that a resolution be adopted to the effect that the industrial and railroad commissions be given every degree of support with a view of hastening the decision in behalf of log shippers.

In speaking of the new Wisconsin workmen's compensation act, R. B. Goodman suggested that the secretary get figures from the State Industrial Commission on the compensation paid out by lumbermen under this act, and that these statistics be sent out in the next bulletin.

W. C. Landon then made a motion asking for a resolution to be sent to the Wisconsin State Industrial Commission asking that an order be handed down compelling all railroads to equip their own logging cars with some safe device for releasing logs.

A further discussion of the compensation act showed that the one

bad feature is the total disability clause. One member told of an experience whereby a shingle sawyer on losing one finger was awarded damages to the extent of his total earning capacity, whereas a fair award would undoubtedly have been the difference between his earning power before the accident and after.

W. C. Landon said that the entire expense to his concern under the new act was \$500 for the past year, based on a payroll of \$187,000. The consensus of opinion was that the act with the total disability clause eliminated is very good.

A resolution was adopted to the effect that letters will be addressed to senators and representatives at Washington urging them to get action on the Stephenson bill, providing that hand brakes shall not be required on cars for logging service.

On motion, the question of extra freight charges based on weight of car stakes was referred to the railroad committee, which was instructed to try to get the roads to allow the actual weight of stakes and to stand one-half the expense of such stakes.

The meeting then adjourned.

Hardwoods on the Pacific Coast

In all the principal cities on the Pacific coast are marketed no inconsiderable quantities of hardwoods. There are dealers in hardwood lumber in Vancouver, Seattle, Tacoma, Portland, San Francisco, Los Angeles and San Diego. In some of these cities, notably in Portland and San Francisco, hardwood lumber is manufactured to quite a little extent, but taken altogether the total would not constitute an output greater than that of one big hardwood sawmill in the Mississippi valley, ranging considerably less than fifty million feet.

The sources of supply of hardwoods that are manufactured on the Pacific coast are Japanese oak from the southern portion of the northernmost island of that group and from adjacent parts of Siberia; koa wood from the Hawaiian Islands; several varieties of Philippine woods (notably the peawood variety, which passes for mahogany); and genezero or prima vera, a beautiful, brown-toned wood simulating in texture and character a laguna-striped mahogany, and some mahogany from the West coast of Mexico and Central American states.

This timber reaches the coast cities in the form of hewn sticks, usually butt cuts, and the freight is very moderate as it largely comes over as ballast. In minor quantities there are a few hardwoods of the Pacific coast region that are sawn at small mills, and find their way into the coast markets. These are made up of Oregon ash, a wood of very inferior quality; laurel or myrtle wood; Oregon oak, which in its chief utilization is in the form of oak boat knees, and in southern California a very small quantity of eucalyptus. As before noted, the total of hardwoods produced on the Pacific coast will not aggregate fifty million feet annually.

Hence, the chief sources of supply for the comparatively limited quantity of hardwoods employed for various purposes on the Pacific coast comes from Michigan, Wisconsin and lower Mississippi valley. These purchases consist largely of white and red oak, white ash, red and white birch and hard maple, and to a limited extent basswood, cherry, red gum, hickory, poplar, Circassian walnut and black walnut. No inconsiderable quantity of 3/8 and 13/16 tongued and grooved hardwood flooring is marketed on the coast, part of it being oak and part maple. There seems to be but a limited demand for jointed flooring strips either in parquetry strips or thicker stocks. The largest center of hardwood grouping and distribution on the coast is at San Francisco, where one yard carries a large stock of American and imported woods.

The general run of finishing lumber on the coast, not only in residences and low-priced buildings, but also in skyscrapers, is made from conifers growing in that region, the prevailing fashion being in finish made from Douglas fir, stained and finished to imitate hardwoods, although birch is employed to no inconsiderable extent for finishing purposes, stained to imitate mahogany.

There is a large trade all along the coast in three-ply panels, also employed in walnut finishing in connection with finishing strips. The best sellers in this region are three-ply birch panels, both in plain and figured wood, but as before noted, many splendid office buildings are finished in Douglas fir or Port Orford cedar, and occasionally one finds a building where the interior finish is made of sugar pine or California pine.

In some classes of finished panels, elm, plain maple, birds'-eye

maple, red gum, mahogany, plain and quartered, are found, but the big trade lies in the panels with birch faces. These panels range in size from 24x60 inches to 30x72 inches, and, while the most is three-ply stock, some of it is made up in five-ply form. Altogether, about eighteen million feet of square Japanese oak finds its way into coast cities for manufacture into lumber each year, and latterly quite a quantity of this wood in the form of lumber has come across.

By no means is Japanese oak a bad wood. It bears quite a close resemblance (only being lighter in color) to chestnut oak of the East, although it has not nearly as much breaking strength or general character of toughness. The figure is small, but for ordinary purposes it is a highly satisfactory wood. While this timber reaching the coast is very low-priced, unfortunately it cannot fail to be noted that the people engaged in its manufacture apparently are making little or no money out of their business, as plain sawed firsts and seconds Japanese oak is being sold in the San Francisco market at this time in lots of a thousand feet at as low as \$65 a thousand, and in some cases at even less than this price, while one-inch No. 1 common plain is selling at the yards at \$50 per thousand and less.

Very little Japanese oak is quartered and does not constitute much of an item in the market. Such as is quartered is sold at from \$100 to \$120 a thousand for firsts and seconds in retail lots out of the yard.

It appears that in the future the Japanese will send more sawed lumber and fewer logs than in the past. Lumber which they produce as a rule is of very good quality. From the prices herewith quoted it will be noted that this sort of competition is a very serious menace to anything like values for eastern oak delivered on the coast, because the Japanese variety will be substituted wherever possible.

Where it is necessary to obtain oak of high quality in figure, or oak of good working strength, Japanese oak will not answer, and it has to be shipped from eastern points.

Next to birch in the coast cities, perhaps maple is the favorite. This is used not only in flooring, but for small timbers where strength is required. There are two or three very considerable stocks of hard maple in various coast cities.

With the growing of wealth and taste for the best there is in wood finish, it would not be remarkable to see quite an evolution in the Pacific coast hardwood demand during the next few years. The present iniquitous freight rate of 80 to 85 cents a hundred on shipments of hardwoods from the East to the Pacific coast renders the broadening of the hardwood merchandizing industry in that region very difficult, but with the opening of the Panama Canal, it may be anticipated that there will be a material lowering in the cost of shipments of eastern hardwoods to the coast, and beyond question the railroads will cut their rates to correspond quite closely with their eastbound rates, which would naturally lower the price of American hardwoods on the coast from ten to twelve dollars a thousand feet.

With this diminution in cost, and a desire on the part of Pacific coast builders to secure the best there is for interior finish purposes, and their financial ability to pay for the best, it is deemed quite certain that hardwood manufacturers can look for a considerable broadening of a market for hardwoods on the Pacific coast very shortly.

Of the finishing of various varieties of wood in the chief Pacific

coast cities, it must be confessed that they know how to treat woods in just as satisfactory shape as they do in the East. Wood finishers of that region are really making some very handsome work out of quite ordinary woods. There seems to be a growing taste for the use of additional quantities of red gum, and also an increased demand for mahogany and other of the finer cabinet woods.

As a general rule, the mahogany of the Pacific coast is red birch in the form of panels and "battens," which is the common name of

the finishing strips, including the parting strips between panels, casings, base, etc.

There is one thing that can be said about the Japanese oak competition. Good authorities state that there is less than 150,000,000 feet of this wood remaining in Japan, and that within five years the total stand will be exhausted. Only the butt cut of the tree goes into hewn timber for lumber production, the remainder of the tree being utilized for other purposes.

Steaming Lumber Under Pressure

Ever since lumber production became an important commercial pursuit there has been but one general system employed in seasoning wood, which has consisted in either cross-piling the lumber or piling it on stickers, and permitting nature to extract such moisture as it could under varying conditions. Such lumber as was employed for high-class purposes was then subjected to one of numberless systems of kiln-drying to fit it for eventual utilization. Latterly the lumber trade quite generally is awakening to a suspicion that a better system of lumber seasoning can be pursued, and during a recent period more than a half score of leading lumber manufacturers have installed, in connection with their plants, an apparatus for steaming lumber under pressure, in large quantities, for the purpose of preparing it for prompter and more accurate drying.

While steaming wood under pressure will not relieve it from log stain, log checks or splits, knots or shake, users of the equipment allege that there are no future defects developed in drying after the wood is subjected to this treatment. Furthermore, it is claimed that the lumber dries out to a lighter weight without checking or warping, to a uniform tone and with a minimum of shrinkage—in some instances no shrinkage at all.

Up to this date the system of steaming wood under pressure is employed by various manufacturers of red and sap gun, oak, cypress, mahogany, sycamore, maple, birch and beech, and every user of the commercial equipment, which is built to handle fifty thousand feet and upwards daily, is enthusiastic over the results attained.

The use of this apparatus has discovered to students of lumber affairs how little even the highest-class experts in the trade know about wood physics, wood structure, wood chemistry or wood diseases. It is found that nearly every variety and thickness of wood has to be treated with different steam pressure and time to attain the highest results in seasoning, and that woods of the same variety growing in different regions have to be handled slightly differently to accomplish this end.

There is nothing new in either the theory or practice of treating wood with steam, either with or without pressure, but within a recent time a commercial apparatus has been devised which renders it possible to treat wood with steam under pressure at a nominal cost and secure remarkably satisfactory seasoning results. Superficial steam applied to wood, either in a dry-kiln or without, certainly assists in the seasoning process, and contributes to the freedom with which certain classes of wood can be bent into form, but it is only with a scientific process that results desired are attainable.

The attainment desired in seasoning lumber is comparatively simple. It is generally known that all the value green wood has for lumber purposes is its fiber or cellulose, and what is being attempted in drying is to drain or evaporate the twenty-five to sixty-five per cent of the liquids or semi-liquids that are contained in the wood fiber and in the cellular structure of the wood. This liquid, made up of various constituents, including tannic acid, albumen, sugar and starch,

and other substances in solution and semi-solution, is to the extent of about one-half contained in the wood fiber itself and the other one-half is enclosed within the cells and ducts of the wood.

In ordinary practice of drying lumber, when it is put in cross-pile with the proper slope for drainage, the moisture contained in the fiber drains and evaporates quite promptly, but the water contained within the cellular structure of necessity has to evaporate through the walls of the cells before the lumber even approximates dryness.

Giving wood steam under pressure simply induces an explosion or slitting of the cell structure, and thus releases the liquid contents for prompt drainage and evaporation. Unless this steaming treatment is done on a scientific basis there are certain dangers involved in its employment, the chief one of which is giving the wood so much steam pressure and time as to pulp or injure the wood fiber, and consequently impair the strength of the lumber. Excessive steam

pressure is also likely to release to too great an extent the tannic acid contained in the wood, which undeniably contributes to the durability of the wood. An excess of steam pressure and time would also change the tone and color of the wood to an extent that might not be desirable, and carried to an extreme would vulcanize the wood, changing oak, for example, to a very dark brown tone.

On the contrary, superficial steaming without pressure may simply assist in breaking the cellular structure on the outside of the lumber, but by no possible chance can it penetrate to the center of the piece without an excess of steaming on the outside; that is, the

piece of lumber can not be steamed with superficial steam and obtain uniformity throughout the boards or plank. Hence, in drying this kind of lumber the quality of the outer section is impaired and the core of the board is unsteamed or insufficiently steamed, with the result that it is very difficult to season the wood without checking and often honey-combing.

As before noted, every wood of every thickness, or every thickness of every wood must be treated somewhat differently to attain the highest results in prompt and accurate seasoning.

There is a cheap and low-cost experiment which should interest every lumber manufacturer in the country, whether he be a producer of hardwoods or softwoods, that is herewith suggested and illustrated.

The equipment consists of a section of standard pipe, say eight feet long, threaded and closed with a cap at both ends. This pipe may be eight, ten or twelve inches in diameter, but the latter dimension is commended for experimental purposes. One cap should be fixed and the other left loose and removable. To this section of pipe a half-inch inlet pipe from a steam boiler should be attached, together with a gauge, and on the bottom a half-inch drainage pipe should be attached.

To carefully analyze the results attainable in prompt and accurate seasoning, it is suggested that boards of one variety and of one thickness be weighed, carefully measured and then cut in halves.

PLAN EXPERIMENTAL EQUIPMENT FOR TREATING WOOD WITH STEAM UNDER PRESSURE

One-half of these boards can be treated in the baby cylinder, and the other half left to dry as in ordinary practice, either in the air or in a kiln. This will enable the experimenter to make a comparison of the shrinkage, time for drying, staining, checking, weight, etc. It will be well to mark the weight and accurate measurement on every piece of lumber and place both the steamed and untreated lumber on sticks for drying in the open or in a kiln. In this manner the steamed pieces will be subjected to harsher conditions than if the entire pile were of treated lumber.

It is recommended in making this experiment that a steam pressure of twenty pounds be used as a basis, subjecting the wood in preliminary experiments to ten minutes at this pressure for each one-inch in thickness, i. e., ten minutes for inch lumber, fifteen minutes for one-and-a-half-inch, and twenty minutes for two-inch lumber. This scale of pressure should be a base, but the time is only approximate. What one must seek to do is to give the wood time enough under this pressure to insure the steam getting to the center of the board, but never by any possible chance to give the lumber so much time in the steam as to injure the fiber of the wood. In no case should a steam pressure of over forty pounds be attempted, as beyond this there is certainty of danger in injuring the strength of the fiber.

Whatever can be attained in the results involved in a section of twelve-inch pipe can be duplicated in a ten-foot cylinder. This is an experiment that costs but a very small amount of money, and it is thoroughly believed is worth trying out by everyone who is having the least difficulty with seasoning defects, stain, shrinkage or excess weights on lumber products.

The Forest Service, through its Madison, Wis., Forest Products Laboratory, has been making exhaustive experiments in the principles underlying drying lumber, and while those in charge have devoted more time to kiln-drying than they have to steaming wood under pressure, Harry D. Tiemann, in charge of the timber physics, alleges:

"The advantage of having the timber heated thoroughly before it goes into the kiln is that heat renders the wood more susceptible to the transmission of moisture. Since the water is evaporated from the surface only and must pass from the interior of the wood to the surface in order to be evaporated, the desirability of having the wood thoroughly warmed when the dry-kiln treatment begins is obvious. Where the wood can stand the heat without detrimental effects for the intended use, preliminary steaming, not in condensed but in live steam, is beneficial. This not only accomplishes the desired heating, but it assists in the transmission of moisture from the center also by moistening the surface if it is too dry. On the other hand, steaming temporarily softens the tissue of the wood so that it becomes more or less plastic, as is well known in the wood-bending industry. Other effects, also, are produced which to a greater or less extent change the properties of the wood. The organic materials or 'sap' in the wood are changed by 'cooking,' and apparently some undetermined chemical change takes place in the ligno-cellulose of the wood itself. This is indicated by the fact that the color of the wood is darkened, the degree of coloring depending upon the temperature and duration of the process, and that the wood, when subsequently dried, has lost some of its original weight and is less hygroscopic. The change in hygroscopicity is beneficial for some purposes, as it reduces swelling and shrinkage of the wood, but the wood is less resilient and if soaked it becomes softer than the unsteamed material and in extreme cases even 'punk.'"

"The pressure and duration of steaming desirable in kiln-drying are points which have not yet been thoroughly worked out. From five minutes to twenty-four hours, or even longer, and pressures ranging from atmospheric to fifty pounds gauge have been used in practice. The higher the pressure the greater is the effect produced, and the longer the time the more thoroughly the treatment penetrates the wood. Experiments have shown that a pressure slightly above atmospheric for twenty-four hours is sufficient to slightly darken two-inch maple clear through, and a pressure of forty pounds will turn oak and probably other hardwoods almost black. Even where the strength of the wood is not the primary consideration it probably is not safe to exceed fifteen pounds gauge pressure (250 degrees F.), except for special purposes."

The writer does not fully agree with Mr. Tiemann in all the statements he makes, because repeated experiments have demonstrated that steam-treated lumber under a maximum of twenty pounds pressure and for a limited period loses none of its resilience, and in no case ever becomes "punk." There is no good reason in commercial practice to steam wood any longer than is necessary to force the steam to the center of the plank. Any steaming beyond that possesses no value and is very likely to affect the strength of the wood. There would be no good reason to leave wood in a steam tank under pressure for twenty-four hours, but certainly if this were done it would be expected that the wood would be materially darkened and the general tone deadened. Furthermore the breaking and crushing strength of the wood would be lessened, and its value deteriorated.

It is a fact that can be substantiated that steaming lumber under pressure for the proper length of time livens the tone, brightens the color, increases the resilience, greatly improves its working qualities and reduces the tendency to swell to almost nil, and even prevents "raising the grain" when the water stains or fillers are used.

H. H. G.

Supply of Paper Birch Not Decreasing

The U. S. Department of Agriculture is authority for the statement that the paper birch, often called also white birch, or canoe birch, is one of the few timber trees in this country which seem to be holding their own against ax and fire. The average citizen probably takes no particular interest in the paper birch. Yet it is doubtful if any other kind of wood on the face of the earth is found in so many households; for paper birch furnishes most of the spools made in the United States.

Maine is the chief center of spool manufacture. Its factories turn out 500,000,000 spools yearly, chiefly birch. Few woods as hard as this can be worked with as little dulling of the tools; its principal recommendation lies in that fact. It is handsome in color, and, after the wood becomes seasoned, it shrinks and warps very little. That is an important consideration, because the delicate machinery that winds the thread would fail to work if the spool changed its shape to a perceptible degree.

The birch wood for spools must be selected and handled with care. The tree's red disk heartwood is objectionable because it will not turn smooth in the lathe, and the color is not desired. Few industries waste more wood, in proportion to the quantity used, than spool making. Heartwood, knots, and all other defects, frequently amounting to more than one-half of the tree, are rejected. From one-half to three-fourths of the remainder may go to the refuse heap in sawing the bars and turning the spools. Despite this waste the paper birch does not appear to be threatened with extinction. It is a fire tree—that is, it spreads rapidly over spaces left vacant by forest fires. The most extensive paper birch forests of Maine and New Hampshire occupy tracts which were laid bare by the great forest fires which swept the region from 1825 to 1837.

The tree is short lived. At an age when the white cedar, for example, is just beginning to lay on useful wood, the paper birch has passed its prime and is ready for decay. It is placed at still further disadvantage by being unable to compete with other trees for light and soil. It prospers when growing alone, but it gives up the fight after stronger trees begin to crowd it. Nevertheless, it is believed that more paper birch is growing in the United States today than two hundred years ago.

The Forests of Mindoro

A description of trees, forests, and forest conditions in Mindoro, one of the Philippine islands, has been prepared by Melvin L. Merritt and published at Manila by the Bureau of Forestry. It is written in a popular style and is largely free from the long lists of unpronounceable names which so often make up the chief parts of Philippine reports. It is easy reading, and an entertaining picture is presented of conditions in that remote part of the world.

Unknown Things About Wood

With all the advance in knowledge in recent times regarding wood, some things remain to be found out. Mysteries still allure the investigator and still tantalize him. For example, the most learned botanist on earth does not know why sap circulates in a tree. Men who have studied the subject know a great deal about the circulation of sap. They know the course it takes, the roads it travels, the channels through which it passes, the paths it follows, what vessels receive it, and the gateways and trap doors by which it passes from one stopping place to another; but what makes it go? Nobody can tell.

Some of the forces are named, and to that extent are known. Capillary attraction is one of them. This causes liquids to flow through minute tubes, like oil rising in a lampwick. There is little question that this force helps send the sap up a tree trunk through the pores of the wood, but it will lift a liquid only a few inches, or a foot or two at most. Its part is mighty small in lifting sap to the top of a tree a hundred feet high.

Then there is a force or process called osmosis. It is the process by which one liquid will pass through a thin membrane to mix with another of a different degree of concentration. It is supposed to have something to do with the movement of sap from one wood cell to another; but no one has yet been able to figure out how it can account for the lifting of the sap long distances, from the base to the leaves of a tree.

A third force acts in sap circulation. It is called root pressure, but just what that is, nobody knows. It lifts sap a little higher than it is raised by capillary attraction, but is totally inadequate to lift it to the top of a tree. If all three forces are added they are still insufficient to accomplish the work done in every tall tree that grows. Something else is working, but it is not known what. Some would call the unknown factor a "vital force"—something perhaps similar to the heart beat of an animal; but since nobody has ever discovered a thing of that kind in trees, the suggestion is untenable, and the ultimate cause of sap circulation remains a mystery.

There are unknown things connected with the structure of wood. They reach this side the realms of chemistry where so many mysteries exist. Microscopists say that a cubic inch of wood is more complex in its structure, more wonderful in its plan and architecture, than the largest skyscraper in the world. There are tubes, arches, pillars, doors, and galleries, fitted together and related in the most wonderful manner. The naked eye never sees the details. They are so minute that they lie beyond the range of unaided vision. All that is seen is a mass, but nothing that is of particular interest, more than a common piece of wood.

Cut off a splinter no larger than the hundred-thousandth part of a cubic inch, and place it under a compound microscope. Details spring into existence. The mysteries of wood structure are revealed—part of them. Single out one of the smallest of the hollow tubes and examine it for details. It is a cell, one of the countless billions which go to make up a tree. It is hollow, with a shell that looks like glass. In fact, it may be compared to a long, very slender bottle with the ends sealed. It may be dyed some bright color and can then be seen better.

This might be considered as the smallest element in wood structure, but it is not. It is composed of parts. By increasing the power of the microscope, concentrating intense light upon the object, and applying certain means of enlargement, the cell may be viewed in size as large as a railroad spike. It is then shown that its wall is threefold, three concentric layers. Each appears to be composed of a ribbon-like substance wound spirally. The spirals of one layer run one way, those of the next run opposite, a sort of "cross-gartering."

About there the end of human knowledge on the subject is attained. The microscope will reveal no more. Its powers have reached their limit, or seem to have done so; and the investigator is balked in his efforts to pry into the secrets of wood structure.

There is something beyond which he cannot reach. What are those spiral ribbons which constitute the cell walls composed of? Are they made up of cells so infinitesimally small that they lie as far beyond the microscope's power as the ordinary cells are beyond the power of the naked eye? No man knows. The threshold to the identity of real wood substance seems to be reached, but the door has not yet been opened by science, nor the inner mysteries revealed.

Chemistry takes up the investigation where the microscope leaves off; but chemistry tears things to pieces. It destroys structure. What men would like to know is, what is the ultimate physical structure of wood? What is the smallest component part into which it can be divided, and still be wood? The spiral bandages which lap and overlap this way and that to constitute the transparent cell wall, is evidently not the last step in subdivision of fiber before it melts, as it were, into its elements and becomes amenable only to the laws of chemistry. Imagination may reach down deeper into the mystery, but science, which deals with cold facts, here strikes an obstacle which for the present bars its further progress.

New Zealand Hardwoods Might Prove Satisfactory in America

Far-off New Zealand is the latest country to which forest experts have turned in seeking substitutes for the valuable American woods used by the furniture, cooperage, implement and similar wood-using industries.

Manufacturers in this country have been facing a constantly decreasing supply of available hardwood timber for a number of years and the time is already at hand when efforts must be made to look to the preservation of the American species most in demand and to scour foreign lands for trees which may prove valuable as substitutes.

Seven different New Zealand hardwood trees have just been put through a series of tests by the United States Forest Service in cooperation with the University of California in the timber testing laboratory at Berkeley. The trees showed up remarkably well in comparison with white oak, which is one of the strongest woods in the United States, developing under test when in an air dry condition a crushing strength of 8,500 pounds per square inch and a bending strength of 13,100 pounds per square inch.

Four of the seven New Zealand woods tested developed a bending strength even greater than white oak and three of the woods showed a greater crushing strength. The New Zealand woods found to have a bending strength as high or higher than oak were the Black Maire, Matai, Puriri, and silver pine, while the first three of these have in addition developed a greater crushing strength than oak. The figures showed that Black Maire has more than one and one-half times the bending strength of oak.

These strength tests of seven of New Zealand's most valuable timbers may prove of the greatest benefit to certain American manufacturing interests if it is found that the islands have enough of the various species to import a little to this country.

The United States will not be able to depend on imports to any great extent, for wood users realize that there is an approaching shortage of timber in other countries as well as this and each nation must cultivate and protect its own forests. It is therefore likely that planting experiments will be made with many of the valuable foreign woods.

A bill is now before the legislature of New Jersey calling for a bond issue of \$1,000,000, to be used in the purchase of 100,000 acres of idle land for a state forest. The bonding of a state for such purposes is believed by many to be a sound business proposition. The state forests now owned by New York and Pennsylvania are estimated to be worth at present from two to four times what they cost eight to fifteen years ago.

Manufacturers' Eleventh Annual

The eleventh annual meeting of the Hardwood Manufacturers' Association of the United States held at the Hotel Sinton, Cincinnati, O., February 4 and 5, resulted in a world of valuable information and suggestions. There were about five hundred present.

President W. E. DeLaney of Cincinnati opened the first session of the meeting Tuesday morning, February 4, by introducing C. A. Hinsch, president of the Business Men's Club of Cincinnati. Mr. Hinsch welcomed the association to the city in a very cleverly worded address, in which he diverged somewhat from the set form of such talks. In speaking of the business conditions of the country, Mr. Hinsch, who is president of the Fifty-Third National Bank of Cincinnati, said that he personally felt conservatively optimistic in regard to the future of the country. He deplored, however, the tendency toward socialism, saying that it is one of the most dangerous problems which we have to confront.

Mr. Hinsch said that big business, so-called, has come to stay and should be controlled and not destroyed, and that legislation should be passed providing for the issuance of federal charters for all companies doing an interstate business, especially those doing a volume of five million dollars or more annually. He suggested that they should be subjected to an examination by the government similar to that now being exercised over national banks, and that all securities issued by these companies should represent real values and should be passed upon by the commission for the purpose of protecting the investing public.

Mr. Hinsch touching on the tariff question said that he did not consider that the coming administration will inaugurate any rash policies in regard to tariff legislation. He based his reasoning on the fact that the national government must have a large revenue to meet its disbursements, and that for this reason, if for no other, we are a long ways from what is commonly known as free trade. This suggestion is particularly pertinent.

The speaker also suggested that a revision of the present currency system will result in greatly strengthening this country's position among the leading financial nations of the world. He said that if the Aldrich bill is not passed, we should enact a law giving to the Secretary of the Treasury, in conjunction with the Comptroller of Currency, and the President of the United States, authority to issue additional currency to national banks, when the exigency of the case requires, equal in amount to twenty-five per cent of the paid in capital of the national bank making application.

Mr. Hinsch's remarks were warmly greeted.

President DeLaney then introduced Charles F. Shiels, president of the Lumbermen's Club of Cincinnati, who also extended a warm welcome to the visiting lumbermen on behalf of the local members of the trade.

D. M. Rose of Knoxville, Tenn., was then introduced by the chair to respond to the addresses of welcome, on behalf of the association. Mr. Rose departed from the usual cut-and-dried formula of responses and talked in a humorous and highly entertaining vein, getting close to his hearers. His humorous allusions to the East Tennessee mountain section from which he hails were greeted with laughter and applause by his listeners.

While Mr. Rose's speech was not in accordance with the regular form, and consisted mostly in bursts of humor, it was none the less a cordial appreciation of the hearty welcome extended by the city and the local lumbermen.

President DeLaney then read his annual address, which follows:

Address of President

The judgment of your executive board in selecting Cincinnati as the place in which to hold the eleventh annual meeting of this association is confirmed by the large and representative attendance that I have the pleasure of greeting this morning, which attendance is a compliment not only to the organization, but to your retiring chief officer as well, to whom you have given without reserve your confidence and support for the past year.

Cincinnati as a whole have that instinct of hospitality that always makes you feel their spirit of welcome when you come, and regret when you go, and I am sure this association will always have a warm place in its heart for Cincinnati.

A year ago in accepting the presidency I promised you I would do my best, and today it is a satisfaction to feel this promise has been fulfilled, regardless of the fact that the much sought for universal inspection has not yet been accomplished.

When addressing you it is presumed that grading and inspection will be the important topic at issue, but today it is my intention to give you a

few thoughts as to other matters, passing the question of inspection with the simple statement that, while there have been numerous failures among the producers of hardwoods who have pursued the policy of grading their lumber from the best side of the board, there has not, during the history of this association, been a failure of any of its members who have adhered to the principles of this organization. In passing, I desire to mention and suggest for your thought and investigation the plan of those interested in the production and distribution of hardware. In this industry there is an organization of manufacturers, one of distributors, also an organization of the retailers; each dealing with the problems affecting their particular branch of this industry. At annual periods they meet in convention, and the problems which affect their industry as a whole are threshed out. Frequently questions of importance are left to the executive committee for ultimate disposition.

W. E. DELANEY, CINCINNATI, O., RE-ELECTED PRESIDENT

The year just closed, especially the latter half, has been a very prosperous one in all lines of business, including lumber, and it is my opinion, as well as the expressed opinion of many, that the prosperous conditions which exist today are accounted for to a great extent by reason of the large crop production, and that the present prosperity will continue at least until this year's crops are considered in business calculations. With the splendid crops with which we were favored last year, exports amounted to nearly two and one-half billion dollars, and deposits in savings banks at about the four billion dollar mark, unsatisfactory business conditions in this country would have been remarkable indeed. To my mind only unnatural causes can prevent continued prosperity throughout the present year. It is true there are problems confronting us which if not rightly solved may lead to confusion, but I am firmly convinced that the people of this country will meet these problems fairly, and are more able now to intelligently solve them than ever before.

I further believe that the lumbermen will do their part toward a correct solution of those problems which effect their own line of endeavor. In making this statement, I am not blind to the fact that perhaps no other industry with the importance of lumber in the commercial world is today handled with as great waste and as little intelligence as our product.

It is my observation also that never before in the history of the industry have the lumbermen been so aroused and alive to these facts, and I venture the prediction that those who have worked so long and earnestly along intelligent lines, will soon reap the reward which is justly theirs, and realize that their efforts have borne fruit. This association undoubtedly deserves a prominent place in the rank of workers striving for more satisfactory results. The industry has been handicapped and assailed on every hand, and one thing that has effected our industry most seriously is the cry that the fast diminishing forests made absolutely essential the adoption of substitutes for lumber.

There is ample timber in this country, if properly handled, to meet the demands for generations. It is quite true that timber is becoming less plentiful, as the annual consumption, together with the waste, is exceeding the growth. Eliminate the waste, harvest our timber as other crops are harvested, and within a short time the growth will equal consumption. This is a statement which I know will be doubted by many, but observation has shown me that there are certain sections of our country in which the growth of timber, after the removal of matured trees, is simply astonishing, and in such sections the one who has that power seems to have allotted it for the growth of timber, as it appears to be adapted to no other purpose. My remarks are applicable only to the character of land that I have referred to, and not to lands where crops other than timbers can be much more profitably produced. What would be thought of the farmer who harvested his wheat before it was ripe, or six months after its maturity? The same might properly be thought of the lumberman. It is easy to belong to the majority. It requires no special ability to drift with the tide, to do as our forefathers did, but it is the constructive thinkers who seize new ideas, and who have the courage to proclaim their convictions that really count.

The effort to find a substitute for lumber for every purpose has about run its course, but the greatest effort must be made on the part of lumbermen to prevent the misuse of lumber, which in every instance promotes the introduction of a substitute. How many lumbermen are convinced that the all-steel passenger car is as necessary to the protection of life as the steel corporation through the public press is endeavoring to lead the people to believe? Is it not the theory of those best informed that the steel underframe with the wood top appeals to them as the logical conclusion, and do you not believe by proper effort the public may also be convinced? Do you think it possible that "good old wood" can be substituted in home-building by any material that will give it the same warm and homelike qualities?

I heartily recommend that you earnestly support the advertising campaign which the National Lumber Manufacturers' Association is endeavoring to promulgate. While no great harm can come from the advertising of any specific kind of wood, if a general advertising campaign is conducted against substitutes, without such campaign there will no doubt be inaugurated by the different associations independent campaigns, resulting in a fight for supremacy of one wood over the other, which should be avoided. Millions of dollars are being expended in the exploiting of substitutes for lumber, and we should meet this movement with united effort. We are combatted by public prejudice, a difficult thing to meet, and I do not think this can be overcome except by a general campaign of education and advertising. A few years ago the use of the wooden box appeared to be at an end, and it was freely predicted that with this result we would never have a market to consume all our low-grade product. Today the supply of low grade is not in excess of the demand. Great credit should be given to the National Box Classification Committee whose campaign was conducted in a remarkably intelligent and aggressive manner. I fear it is not being given the credit which it so richly deserves.

An equally intelligent campaign against other so-called substitutes, conducted by men qualified to handle it, would bring similar beneficial results. This campaign has resulted in a demand for box standardization, a matter in which the lumber producer as well as the box manufacturer is vitally interested, and if properly handled will result in much benefit to both, but a detriment if improperly looked after. I think the lumber manufacturer should lend his every assistance to the box industry to solve

this problem. We should aid in overcoming conditions which involve a hardship upon any of our customers.

Of interest is the action of the window glass industry, which recently decided to make a charge for boxes, a movement undoubtedly beneficial to lumber. All commodities should be subject to a charge for boxing. If the consumer pays this tax the interest of the shipper is in having the goods reach his customer in proper condition, and the false economy now being practiced, of attempting to furnish packing cases at the lowest possible figure, irrespective of efficiency, will, to a degree, be eliminated.

A subject which should be given attention is the probable enactment in most states of a workmen's compensation law, in order that just and proper bills may be enacted, and that all states have bills of similarity to prevent confusion. This brings to my mind the vital question of citizenship. Many of us refuse to participate in local politics, fearing revenge at the hands of the politicians. This to my mind is the height of cowardice. As property owners and citizens we should assert ourselves.

Frequent increase of lumber rates the past few months by the railroads indicates a concerted effort for a general increase of rates on lumber. Numerous rate hearings have been held before the Interstate Commerce Commission, and in almost if not every instance, the railroads have been represented by a battery of attorneys who put witnesses through a severe mill. The railroads appear to be united, and are much better organized than are the lumbermen. I fear that it is an unorganized movement against a well drilled organization, with prospects of the usual result. A thorough investigation of this subject will show that lumber as a commodity is at present paying higher rates of freight than its just proportion. I would recommend a uniting of our forces and the employment of experts to investigate and properly present our case before the Interstate Commerce Commission. We boast of our railroad systems, yet they kill more people in the year than all the railroads of Europe combined. One of the oldest eastern roads in America constructed at small expense, running through the most thickly populated district of the country, has had a most appalling list of accidents in the past few years, caused or aggravated by careless methods and obsolete rolling stock. Casual outsiders complain that it is almost impossible to operate railroads at a profit. This is mere rubbish. In spite of bad management, and in spite of high cost of labor, the road just referred to, can and does earn more than ten per cent of its real valuation today, but its earnings have been watered down, and its finances crippled by the purchase of competing trolley lines at double their true value.

We have and are now passing through demand of the public for government investigation of all lines of trade. No member of this organization need fear any violation of the law on our part. We are not only keeping within the letter, but within the spirit of all government restrictions. With the high cost of timber, and increased cost of production, this organization is dealing with a condition and not a theory. Prior to its existence a profitable hardwood lumber operation was almost unknown. It was a business of hard work and no profits. It was difficult for many to even get the comforts, to say nothing of the luxuries of life. The banks of the country classed the industry as an undesirable risk. Timber was bought very cheap, labor was plentiful and wages low, but the only profits we received were on paper. It was easy to figure out how much profit we should make, but actual results never equalled our paper expectations. A small body of men determined that these conditions were not right, and should be changed. It was a hard fight, not yet finished, but the ground gained will never be lost, and we are still striving, not for more than our just dues, but for what we are legitimately entitled to. The principles of this organization are correct, and deserve the same support from every manufacturer of hardwood lumber as is given to any other department of his business.

One word on the marketing of our product. Let us thoroughly grind into our sales department that their duty is to sell the product that the logs produce when handled to their best advantage, and they are to seek customers whose requirements demand the product of manufacturing plants which handle their product as indicated.

It is a great achievement, in these days of big business, to be a representative concern in any line. Such a reputation is extremely hard to acquire, and equally difficult to maintain. I urge every member of this organization to give the greatest care to the production of his lumber by properly manufacturing, curing and shipping his stock, and this, coupled with the policy of our organization to give to all the fairest, squarest treatment possible, will result in this organization maintaining the dominant position it now holds in the lumber trade.

I thank you for the generous co-operation given me throughout the year, and bespeak for my successor the same cordial treatment. I shall always cherish my association with the officers and members of this organization, to whose call I shall at all times gladly respond.

Secretary Doster read the treasurer's report, which showed the following statement:

Cash on hand January 31, 1912.....	\$ 2,028.80	
Cash receipts for year ending January 31, 1913...	32,670.62	
		\$34,699.42
Disbursements, same period.....		32,373.51
		\$ 2,325.91
Cash on hand January 31, 1913.....		
Cash in bank.....	\$ 2,323.98	
Petty cash.....	1.93	
		\$2,325.91

Secretary Doster then delivered his annual address. In speaking of the bureau of grades he said that the number of men has been reduced owing to the reduction in the number of complaints during 1912. He said further that the inspectors had been so located as to insure quick service at any place where complaints arise.

The aggregate amount of lumber on which complaints were registered was 4,133,137 feet in 1912; 6,215,908 feet in 1911, and 6,324,127 feet in 1910.

The secretary attributed this lessening in the amount of rejects to improve business conditions and the system employed by the inspectors, which gives the purchaser the opportunity of studying the proper methods of applying the grading rules. He also said that a closer study of the grading rules by the purchasing element has a tendency to reduce the number of complaints.

The secretary reported that the system of mill inspections employed during the past year has instilled a considerable feeling of confidence among the members, and that as a result they feel that they are preparing and loading their lumber out properly and uniformly. This system consists of a series of visits by inspectors who make suggestions as to standardizing methods of grading.

The secretary referred to the subdivisions among the membership that were put into effect during 1912. The following classes were established:

- CLASS 1: Oak construction and car material;
- CLASS 2: Wholesale poplar planing mills;
- CLASS 3: Poplar, chestnut, basswood and buckeye;
- CLASS 4: Gum and cottonwood, rough and dressed;
- CLASS 5: Ash, cherry, walnut, butternut, beech, birch, maple, elm and sycamore;
- CLASS 6: Chair furniture and vehicle dimension;
- CLASS 7: Mahogany.

These divisions reported at various times during the year on stocks on hand and general conditions regarding the various woods. The first book embodying a compilation of these reports was issued in July, and the second in October. Since then three supplements have been published.

The secretary spoke of the canvass on the part of the association for specific and private information covering credit features of the consuming trade not shown in the ordinary credit rating book. He said this information is held absolutely confidential, and that the source is in no instance divulged, but that the members are enabled to get close and intimate knowledge of consuming factories through this means, which they could not possibly obtain in any other way.

The report spoke of work now being done through the secretary's office with a view to compiling information and statistics as to comparative stocks on hand and values January 1, 1912, compared with January 1, 1913. The report forms will show the rough stock column in feet, and the average value January, 1913, and the same columns for January, 1912. The items will be subdivided into the standard grades. These statistics could not be gathered in time for the annual meeting, and it is hoped that the members will give the matter their early attention so that the information can be issued in the near future.

In touching on the sales code question the report said that various members are using on their quotation forms and on their letterheads, immediately under the salutation, the following:

"All quotations and contracts are made subject to the sales code and inspection rules of the Hardwood Manufacturers' Association of the United States now in effect, copy of which will be furnished on application."

This method has been decided to be the simplest and the strongest to pursue, and avoids unnecessary complications which arise from time to time without some such provision.

The report referred to the question of arbitration and then told of the meetings of the executive board.

In speaking of workmen's compensation laws and legislation to prevent accidents in industrial plants, Secretary Doster commended the work being done by the National Association of Manufacturers with a view to securing uniform legislation on these subjects. He suggested that every hardwood manufacturer could profitably lend his support to this movement.

The report said that there has been a substantial increase in the membership of the association during this year. He said further that at the end of 1911 the estimated total acreage owned by the membership was 5,207,000; the estimated increase during the year was 420,000 acres. Of the total, 200,000 acres were cut during the year, leaving a net increase of 200,000 acres.

The report then referred to the publicity department and financial condition of the association.

In speaking of the general conditions of the country, Secretary Doster said that in his travels over the various hardwood states he had found that more manufacturers are now maintaining their offices at their mills. There has also been an apparent increase in the number of transfers of large timber areas. This insures larger operations and hence more up-to-date machinery, and a better line of production. It will also result in a closer utilization. The further result of this change will be closer interest in association work, because of the fact that the larger the interest and consequent investment, the greater interest will be felt in the development of any work that will result in information bearing on the business.

In closing Secretary Doster thanked the members for their cooperation in the matter of gathering statistics, and further for their assistance in helping to promote the welfare of the association.

The chair then appointed a committee on officers' reports, which included W. A. Gilchrist, A. P. Steele and C. L. Harrison.

The meeting then adjourned until the afternoon.

AFTERNOON SESSION

The afternoon session was opened by John A. Smith of the Smith Sash & Door Company of Rochester, N. Y., who talked on the subject of "Waste of Material, or Lumber from the Sawmill to the Consumer."

As suggested by the title, Mr. Smith's talk went into details covering possible waste and closer utilization of forest products both in the matter of utilizing waste and of preventing it by cutting lumber more closely to meet the consumer's requirements.

The speaker said that of all hardwood lumber used in house work and furnishing seventy-five per cent goes into millwork, twenty-three per cent into furniture and two per cent into picture frames. He said that the greatest waste is found in the manufacture of millwork.

While Mr. Smith's suggestion that logs should be cut into sixteen-foot lengths aroused considerable interest among the membership, the suggestion was not deemed highly practical.

He further suggested that lumber should be piled according to widths and lengths, but in making this suggestion it would seem that he overlooked the enormous amount of space it would take to sort out the cut of the average hardwood mill in this way. If it could be done it would undoubtedly result in a great service to the consuming trade, but the difficulty would be in realizing a sufficient premium on such sorted stock to return a profit on the additional investment. It may be that this will ultimately become the general method of piling hardwood lumber, but it is hardly probable according to the sentiment as expressed by the members that this condition will be realized for some little time to come.

The speaker then referred to the facilities offered by the manufacturer of hemlock who has his lumber (which is probably one of the cheapest in the market) cut in lengths and sizes desired. As pointed out by several members, however, he entirely overlooked the fact that hemlock is sold to a large extent as bill stuff, while hardwood on the other hand goes into a very different line of consumption, and cutting into stocks of special lengths and widths is entirely impracticable.

The speaker said that seventy-five per cent more hardwood goes into the manufacture of houses than forty years ago. He further said that over eighty per cent of the hardwood lumber that the millman uses has to be cut seven feet or more in length. He then outlined an example showing the sizes and dimensions of the various pieces of lumber going into certain lines of manufacture. The idea of this suggestion was that sixteen-foot lengths could be more profitably employed than the twelve or fourteen-foot lengths commonly offered.

The speaker made one point which undoubtedly is based on fact and that is that familiarity on the part of the sawmill operator with the waste daily resulting from his lumber production breeds the pro-

verbal contempt for such waste. In other words, the outsider coming in from time to time could more fully appreciate the enormity of such waste than the manufacturer who is constantly in touch with it. The speaker pointed out that while efforts are being made to insure closer utilization still there is an enormous amount of unnecessary waste of forest products, which can be prevented only by a general adoption of such methods as will insure closer cutting of material to meet requirements, and also the adoption of the manufacture of certain articles to utilize further the smaller cuttings resulting from the manufacture of ordinary lumber.

Mr. Smith instanced his own experience showing that until he analyzed closely the question of mill waste he made very little money, but that now he is utilizing everything. He says that he makes one hundred doors a day, and that they are all made from firewood; namely, pieces as small as one inch thick by one-and-a-half inches wide, and as small as three inches long. He did not elucidate as to the exact process of getting at this result.

Secretary Doster then read a letter from W. S. Whiting of Asheville, N. C. Mr. Whiting said that having been convinced for some time that a great loss is being incurred by turning out hardwood stock that does not go into lath, his company determined to construct a mill at which it could utilize the waste at a reasonable cost. The plans as finally drafted involved the following features:

The mill was built to make a run on chestnut logs a half day at a time. Chestnut hog dust is delivered to the carrier containing the chestnut sawdust, and thus the entire product of the chestnut log outside of the lumber is delivered into a car without handling and sold to an extract plant. About four cars of this refuse is made by a 60,000 feet capacity mill in ten hours' work. The chestnut shavings were sold in the same way by having individual pipes put into the planing mill to deliver the shavings into the car.

The third suggestion involved the following units employed in the dimension room: One long sorting chain in back of the slab slasher; one long delivery chain parallel with the slab chain; one lath mill outfit and hog in each end of the room, and in the center; one slab resaw; one boxboard edger; one band rip saw; two cut-off saws. The letter stated that in one month when the lumber cut was 1,800,000 feet the mill turned out approximately 200,000 feet of dimension stock made up of lath, inch oak 1x3—12 and 48 inches long; inch poplar, basswood and chestnut shorts of any width and 12 to 48 inches long.

The letter stated that the company employed a man conversant with the dimension manufacture and market to look after this end of the business, but that it soon found it was making stock that was hard to market. It was further found that it was accepting orders that it could not fill because of accepting too many of one kind.

This difficulty suggested the idea of enlarging the field and going at it a little differently.

Secretary Doster, according to the letter, suggested that the association might co-operate, with a view to securing a better knowledge of the dimension market; more mills to cut out the stock, and an instructor or superintendent to oversee and check up the entire field. This suggested, according to the letter, a department of the association to carry out the following work:

To investigate the dimension market and secure schedules of material used by different manufacturers; to line up the manufacturing members and ascertain those who would come in on a plan to stand behind the department in its efforts to solve the question; to distribute the orders among the different members and let the department act as a sales department, and to employ one or two good men acquainted with the dimension business to supervise the work at the different mills; keep a line on stock, manufacturing methods, etc.

In order to arrive at this result it would be necessary to secure knowledge of what the product of the dimension mills is best adapted to; where to market it, and at what price; also to provide adequate means to get out stock to meet the demands.

Such a plan carried out by the association would be instrumental in standardizing a large percentage of the dimension material cut, and in that way the mills could be working on dimension stock that already had a sale.

A further advantage would be the fact that a considerable number of mills could work to better advantage than a few, because under present conditions orders can not be accepted at times because of limited capacity.

The letter strongly recommended that the association take up this proposition in a serious way as a step that would materially improve conditions among the manufacturers making up its membership.

J. K. Williams of the Williams Lumber Company, Fayetteville, Tenn., read a paper, entitled "The Co-operative Spirit." This paper appears without comment in another part of this issue of HARDWOOD RECORD.

J. E. Rhodes, recently-elected secretary and manager of the National Lumber Manufacturers' Association, addressed the convention. Mr. Rhodes told of the work being done by the Blue Book published by the National Lumber Manufacturers' Credit Corporation, with headquarters at St. Louis. This is a corporation subsidiary to Mr. Rhodes' association. The speaker said that while the Blue Book is approximately on a revenue-producing basis, it needs the support of the entire manufacturing element of the country in order to put it on a proper footing. He asked that members of the association be not backward in giving information to the Blue Book authorities as to credits. The terms of the book involve two issues yearly and sixty special reports, which cost a total of fifty dollars. He said further that he has been authorized to make the offer to subscribers of ten dollars for every new subscription turned in.

In speaking of the proposed advertising campaign to be carried on by the National association, Mr. Rhodes said that up-to-date insufficient contributions have been received to inaugurate the campaign on the proper basis, but he added that there was every reason to believe that in the not far-distant future a sufficient sum will have been obtained to carry on the work, and that it would eventually be made the chief feature of the association's efforts.

Mr. Rhodes said that in considering the proposed forest products exposition, it has occurred to him that it would be a good idea to have such an exposition on a permanent basis to be moved from city to city. The exposition could be carried on along the same lines suggested originally. He stated further that such an endeavor could undoubtedly be financed more easily than the general advertising campaign proposed, and that with it as a starter would undoubtedly eventually come the general advertising of lumber.

Mr. Rhodes told of the field of effort for the National association, and said that in no way would it conflict with the thirteen affiliated organizations. His association can only take up questions of a general character. He said that he is in hopes of securing from the affiliated organizations regular statistical reports on cut and shipments of each. In speaking of lumber classification and freight rates Mr. Rhodes reviewed the Los Angeles hearing, which he said brought out a vast amount of evidence on the part of the railroads, who are distinctly aligned with the lumbermen before the Interstate Commerce Commission in an effort to secure a better classification for goods packed in wood containers than for goods packed in fiber containers. The case has been scheduled to come up in Chicago on February 27.

Mr. Rhodes stated that with the gradual decrease in the amount of standing timber and corresponding increase in stumpage values, it is absolutely imperative that lumbermen turn their attention to matters of conservation. He said that the nation-wide clamor of conservation of National resources will ultimately redound to the detriment of the stumpage owner in the matter of legislation forced by public sentiment, if such owner does not himself inaugurate some plan of providing for a perpetual source of supply for woods products.

The speaker then made observations on the sentiment he had encountered during the last three months on his various trips carrying him in all parts of the country. He said that everywhere he encountered the most satisfactory reports on present trade and prospects that he had ever heard. In closing he pleaded for co-operation on the part of the Hardwood Manufacturers' Association with his organization.

President DeLancy then appointed the various standing committees, and the session adjourned for the day.

WEDNESDAY MORNING SESSION

The session of Wednesday morning opened with reports from some of the committees on the different woods manufactured by the association members. Most of these committees were not ready to report. It was shown that the demand for chair and furniture dimension is strong. It was also shown that low grades are excessively scarce in practically all grades, and prices are firm.

Foster V. Smith of Indianapolis read a paper on "Insurance." Mr. Smith said that the annual destruction of property by fire alone in this country has been estimated at from a quarter to a half billion dollars. He said that the country is thus so much poorer and that each one of us in one way or another must and does pay a portion of this loss. The burden is justly distributed among property owners by the payment of insurance premiums and indirectly passes onto the people, as a whole, through prices.

The speaker said that few subjects are of more importance to the lumberman than insurance against the hazard of his business. He raised the question as to whether insurance fully accomplished its purpose, and further said that there is vastly more to insurance than the mere policy. He said that in placing an insurance contract there are three matters of importance to be considered: The ability of the insurance company to perform; the provision of the contract or policy offered; the consideration asked for, or as generally termed, "the rate." He said that policyholders seldom look into these questions, and that the average man taking out insurance merely signs up the agreement to pay so much without really understanding what he is getting in return. He said that it was the duty of the lumberman to study the hazard side of his business, and use all reasonable means to reduce it.

In speaking of the average insurance policy, the speaker said that the provisions of the contract usually receive little actual study at the hands of the policyholder. He said that one risk is as different from another as one individual from another, and that the fire insurance contract, to properly cover the property and duly provide for existing hazards, must be drafted with the particular risk in view. He urged each member to read the printed conditions on the standard fire insurance policy carefully and to note the conditions and restrictions it imposes, and then to ascertain if the hazards are met and the property duly covered.

The paper said that a closer application to the matter of insurance would result not only in a direct saving of considerable money to the policycarrier, but that it would absolutely guarantee to him that in event of fire the insurance would be fully and satisfactorily taken care of. He further said that no man knows when fire will take place, and he should consider his insurance with the idea that his property is liable to burn the following day.

The speaker advocated that if the manufacturer himself is unable to give the matter his personal attention, he should detail someone to make a close study of the question and keep it under his personal supervision.

Secretary Doster read a letter of greeting from the Lumbermen's Club of St. Louis, addressed to the Hardwood Manufacturers' Association.

Frank A. Nurre of Cincinnati reviewed the terms of the proposed workmen's compensation law of Ohio. He stated that while this law applies only to Ohio manufacturers, its provisions are fairly typical of the compensation laws in force in the various states. It provides that every employer of five or more men must insure with the State Insurance Commission, and if he does not take advantage of the act he loses his three defenses in case of accident to any employe. The speaker said that under the act each employer is compelled to pay a semi-annual premium determined by the state insurance board, and that those not paying this premium are liable for any injury to employes. The act as it reads means that the employer must come under it, and that if he does not pay the assessment his case in the event of injury to any of his employes is practically hopeless. The act further provides that any employe hurt by wilful act of employer in the matter of not providing proper safety appliances, can sue either in the civil court or secure compensation to the extent provided by the act.

Discussion of the talk showed a varying opinion among the members

as to the ability of the various state insurance acts to cover the question in an equitable manner. It was noticeable that those members expressing themselves as favorable to the act referred to are not residents of Ohio, while the expression of opinion from the Ohio manufacturers was rather against the proposed measure.

The chair then appointed a nominating committee as follows: A. P. Steele, A. E. Norman and F. A. Kirby.

The committee on officers' reports recommended that the present standing committees of the association meet for the purpose of taking up statistical work with special reference to stock on hand, market conditions and other matters of importance affecting hardwood lumber in the various sections of the producing territory, and that the members of these committees be selected as nearly as possible from the representative producing sections, and with particular reference to the specific hardwoods produced. The report further suggested that in the event of any vacancies occurring on the committees, the president has the right to appoint successors.

The report further recommended standing committees on arbitration, transportation, freight rates, standard weights of lumber and logs, executive grading commission, cost of manufacture, sales code, utilization of waste, insurance matters, legislation and freight legislation.

Committees on resolutions and nominations were further recommended.

The committee commended the reports of the president, secretary and treasurer and recommended their adoption.

R. H. Vansant moved that the committees on the various kinds of woods make a written report to the secretary at as early a date as possible in order that information covering market conditions and stocks of the various woods may be compiled in the next bulletin issued from the secretary's office.

The motion was carried.

H. E. Sumner of the Sumner Lumber Company, New York, delivered an address, entitled "Personality in Selling." This appears as a special article in another section of this issue of HARDWOOD RECORD.

The report of the committee on resolutions expressed the appreciation of the association as a body for the warm welcome extended by the local trade and by the city of Cincinnati. It expressed appreciation also of the addresses delivered by various men, the excellent service afforded by the Hotel Sinton, and the generosity of Henry Disston & Sons, Inc., who contributed the badges to the association.

Then followed other resolutions, which are shown herewith:

THE GOVERNMENT FORESTRY SERVICE

RESOLVED, That this association approve in a general way the past accomplishments of the Federal Forestry Service of the Department of Agriculture. While there may have been occasional mistakes of policy in administration, the good accomplished has far outweighed them and we strongly disapprove any effort to distribute the national forests among the various states. We believe that the forestry policy of the nation should be handled as a unit, and that the various states should individually co-operate in forestry matters within their present domain of jurisdiction, in which there is ample opportunity for greater work than any state has yet accomplished.

ORGANIZED SYSTEM IN ELIMINATING FOREST WASTE

RESOLVED, That this convention heartily approve the suggestions contained in the communication from W. S. Whiting of the Whiting Lumber Company, Asheville, N. C., that a system be organized whereby various items of dimension manufactured from waste at individual mills may be accumulated in order to fill orders which otherwise could not be handled by any one mill without prohibitive amount of delay, and we recommend to the incoming officers of the association that the matter of perfecting a plan of this sort along Mr. Whiting's very clear and detailed suggestions be given careful consideration, and that the convention authorize the incoming president to appoint a special committee on this subject if it is believed that the matter can be most practically handled in this way.

CHESTNUT TREE BLIGHT

RESOLVED, That this association heartily approve of the work being done by the Federal Forest Service in the fight against insect devastation of trees which does more damage annually than fire, and particularly the organized effort to control the chestnut tree blight, and this association pledges its hearty co-operation in every possible way in this matter.

FOREST PRODUCTS EXHIBITION

WHEREAS, We believe that great good to the lumber industry of the United States will come from the advertising of forest products, with the object of educating the public to the fact that lumber is obtainable in sufficient quantities for all uses for which it is adapted, and with the hopes that a comprehensive campaign may result therefrom, be it therefore

RESOLVED, That we hereby endorse the suggestion of an exposition of forest products to be held under the jurisdiction of the National Lumber Manufacturers' Association, financed and managed in such a way as the National association may deem best.

The meeting then adjourned until the afternoon.

The only business transacted in the afternoon session was the report of the nominating committee. The following new officers and members of the executive board were suggested by the committee and were duly elected by the association:

PRESIDENT, W. E. DeLaney, Cincinnati, O.
 FIRST VICE-PRESIDENT, J. H. Himmelberger, Cape Girardeau, Mo.
 SECOND VICE-PRESIDENT, B. B. Burns, Huntington, W. Va.
 TREASURER, C. M. Crawford, Coal Grove, O.

EXECUTIVE BOARD

W. E. DeLaney, Kentucky Lumber Company, Cincinnati, O.
 J. H. Himmelberger, Himmelberger-Harrison Lumber Company, Cape Girardeau, Mo.

B. B. Burns, C. L. Ritter Lumber Company, Huntington, W. Va.
 C. M. Crawford, Yellow Poplar Lumber Company, Coal Grove, O.
 W. B. Burke, Lamb-Fish Lumber Company, Charleston, Miss.
 R. M. Carrier, Carrier Lumber & Manufacturing Company, Sardis, Miss.
 Clinton Crane, C. Craue & Co., Cincinnati, O.
 W. H. Dawkins, W. H. Dawkins Lumber Company, Ashland, Ky.
 Frank F. Fee, Fee-Crayton Hardwood Lumber Company, Dermott, Ark.
 W. A. Gilchrist, Three States Lumber Company, Memphis, Tenn.
 E. A. Lang, Paepeke-Leicht Lumber Company, Chicago, Ill.
 J. W. Oakford, Cherry River Boom & Lumber Company, Scranton, Pa.
 A. B. Ransom, John B. Ransom & Co., Nashville, Tenn.
 W. B. Townsend, Little River Lumber Company, Townsend, Tenn.
 R. H. Vansaut, Vansant-Kitchen & Co., Ashland, Ky.
 E. M. Vestal, Vestal Lumber & Manufacturing Company, Knoxville, Tenn.
 E. B. Norman, Norman Lumber Company, Louisville, Ky.
 E. C. Robinson, Mowbray & Robinson Company, Cincinnati, O.
 W. M. Ritter, W. M. Ritter Lumber Company, Columbus, O.

ENTERTAINMENT

The customary banquet usually given at the Hotel Sinton was dispensed with, and in its place a simpler and more enjoyable function in the shape of a beefsteak dinner was tendered to the visiting lumbermen by the Cincinnati Lumbermen's Club at the Business Men's Club on Monday evening, February 3. There were about one hundred out-of-town lumbermen in attendance, including the officers and most of the executive board.

Personality and Salesmanship

Editor's Note

The following paper was read by Herbert E. Sumner of New York, N. Y., at the annual meeting of the Hardwood Manufacturers' Association of the United States at Cincinnati, February 5, 1913.

One of the best known lumbermen, retiring from active business, stated, "I have plenty of money now, but never want to see the game again. Although I had an established business left me, the lumber game in the twenty years of my experience was the hardest and most nerve-racking imaginable. There was so much competition from concerns which did not understand a thing of costs and which were doing business on practically no profit, fooling themselves as to the figures, that when we reckoned up finally, we found that we had only made a fair percentage. These concerns wouldn't last long, but the trouble was as they failed, up would bob another and then it was the same old story again. Fight, fight, fight for business, all the time, my hair is gray and I am tired. I have enough to live on and I am done."

One by one you note the dropping off of first this wholesaler and that retailer, either retiring, failing, and, once in a while, a few concerns merging; but the gradual falling off of the number of concerns tells the story all the time. It can be summed up in a few words.

Lumbermen are only lumbermen; they are not merchants. To illustrate this I will tell a little story: I was talking to the buyer of one of the largest furniture manufacturers in the East, who wished to place an order for a year's business on oak dimension stock. He gave me the sizes and then I started to figure the cost of getting it out, using No. 2 common oak, allowing for waste, percentage of cutting, cost of manufacturing, freight, etc. When he saw the careful figuring I was doing, he broke in with, "That's enough; you're one of those lumbermen that understand too much about the cost of things. I will bet you want about \$45 or \$50 a thousand for stock." "Well," said I, "isn't it worth that or even more to you? You could not buy absolutely clear lumber for even \$45 or \$50 a thousand, yet I am going to figure on giving you stock already cut to size and clear, so that you merely have to assemble it."

"Guess you are right, but we cannot do business with you. I know at least three concerns that will furnish it for \$32 a thousand and who will be glad to get it."

"But they don't know their costs," I ventured.

"That's not my business, but to tell the truth, I am dead certain that they lose money on every shipment. Don't you suppose if

I could get it out here in my own plant at any such price as they quote, or even a less price, that I would do it? But I can save over \$20 a thousand feet in buying from those concerns."

Of course that is only one part of the lumber game; you can see what I am driving at. You really cannot blame buyers for getting their stock from men who don't know their costs. This is a true illustration and you can see the same thing almost any time.

The hardest competition the wholesaler runs up against is that of the large manufacturer who maintains a sales force in the different large centers. There are of course exceptions to the rule, but in the main the men in charge of these offices have no more right to be in their position than a switchman has a right to drive a "limited." It seems without exception that the larger the concern the more imperfect and ungeneral-like the man in charge. He always carries an imperialistic manner with him. In my experience I claim that as this faculty is made the most of, just so a man gets weak in another. I call that theory "balance." We men who have studied the scientific selling game are somewhat of psychologists, or, in others words, readers of human nature, but sometimes we forget that the man who buys from us is just as much a reader of human nature and in many cases a better one than we are ourselves. To illustrate. One of these managers in our vicinity got into an argument in regard to salesmanship, prices, etc. In part he said, "There is no personality in salesmanship—it is a cold, hard proposition of dollars and cents. Your No. 1 common oak, for instance, isn't as good as mine, so you can't get the price for it. Again, we are big manufacturers and you are wholesalers. You cannot name a single instance where you can dispute my theory."

"What do you get from So and So for your No. 1 common oak?" I asked.

"\$41.50 delivered and it's the market price," he answered.

"Well," I fired back at him, "you claim that my grade is inferior to yours and for all I know it may be, but nevertheless, I get \$42 for it. Now you claim there is no personality in salesmanship."

"Yes," chimed in another salesman for a wholesaler, "and we get \$43 from the same man and for the same stock."

This is the type of salesman that creates the break in market

prices. I think personality is one of the greatest assets of a salesman in any business. Personality itself is the means of getting many orders at even prices, and in some cases the man who is liked gets the order at a higher price because they have faith in him, and where faith is shown it is simply a stronger bond that has been welded by the man's personality.

There are too many lumbermen, but there are very few lumber merchants. What does it cost you per thousand to sell lumber? How many can tell?—perhaps one out of a hundred really can. What does it cost you per salesman to sell lumber? I bet not one out of five hundred lumbermen can answer that correctly. What does it cost any particular salesman to sell lumber? What does it cost to dictate and write a letter? I don't think one in a thousand can answer that last question correctly. Understand, I say lumbermen, because of course there are cost accountants and men in other lines of business who know how to figure costs. Lumbermen are as a class, in relation to their commodity, the poorest business men of today; yet the lumber business ranks fourth in the country and it ought to be a science.

We ought to import a few advertising men into the lumber business. They are the boys that get at the facts. Any advertising man turned loose in your own mill or yard will dig up more real, salient, selling points about your own business than you or your salesmen ever knew existed, because that is one of the first principles of advertising, and the next one is to see whether the manufacturer knows his costs and whether he is producing his product on a scientific basis. Besides discovering new selling points, creating new markets, overcoming criticisms and objections that are continually fired at them, they can think up appropriate replies and arguments for the product before they ever hear of objections or criticisms. In fact, they figure in advance, so to speak. Advertising men are real merchants, because they have to be.

I learned the lumber game from experience and I have had some years at it. But about three years ago I discovered the possibilities of advertising and especially in general and mail order work. I think I can say that I was of the usual type of lumberman at first, but advertising has taught me real merchandising and salesmanship. One of the first principles of salesmanship is to have the manufacturing end of the game down to perfection and know what the real cost is, in order that in the case of a high price (if it is high) you can think out the real selling points in connection with it and see where the value comes in. Study of the costs teaches a man the proper worth of the stock and enables him to sell so as to make the proper margin of profit. Now, for example, would you sell a car of 3 inch oak, that you had had on hand for two years, at the same price as a car of 3 inch that you had had on hand but six months? If you do you are a poor merchant. That old stock is worth twelve months' interest at 4 to 6 per cent added on the price of your six months old stock. Is not old stock of more value? Surely you can find consumers who want dry stock and who are perfectly willing to pay the price. Yet I know of concerns that do not recognize the difference and sell at the same price.

There are some wholesale dealers who take orders at little or nothing in the way of profit to keep the trade, and excuse themselves by saying that they make it up on other orders. Wouldn't you or I be pleased, if we were consumers, to know that we pay these dealers a little more for our lumber in order to help them give lumber to others at cost or less? Common sense should tell a man, even though he has no ideas of merchandising, that every shipment should show a profit. We eliminate from this, however, the refused car. I have said that every shipment should show a standard profit but I do not see any objection to making more than usual when you can.

Have you ever looked over a list of customers of any wholesale concern that failed? If you have not, do so; it will cause you considerable surprise. I have examined two lists of recent failures in one of our largest cities. In both cases the customers were of the poorest class of trade—all lengthy time takers and concerns who are constantly sending out complaints. Now any merchant who understands his business will tell you that it costs exactly the same to sell the best class of trade as it does the poorer class

of concerns. Another thing, the larger the concern the more stock it uses. If it is a question of salesmanship, isn't it just as easy to sell a large concern as it is a small one? That is the way I reasoned it out in my several years of experience. I know for a fact that my sales' cost is less than that of any other wholesale dealer. Furthermore, I know exactly what percentage I have to make in order to pay dividends. Now, on the other hand, right in our own city, I know wholesale concerns handling stock at 50 cents a thousand feet and I know further that there are wholesalers selling some pine and some hardwood at a profit of 25 cents per thousand feet. I would not think so much of it if they were commission men, but they actually handle the accounts through their books and in most cases have to pay the mills cash and their customers take three or four months' time. These are the men who go under sooner or later, but while they last they are destructive characters.

In closing, and as a contrast, I would like to explain my concern's new method of selling one of our American woods. We have always been firm in our belief of this particular wood and have pushed the sales by scientific advertising and also service in showing our customers how to kiln-dry, finish and take care of the wood in general. Our success has been marked, and I think a record of it has already been published. Since the first of 1913, however, we have adopted a new policy. For example, in answering an inquiry we reply that we have the stock on hand (and as we have enormous production, we nearly always have) but that we do not care to submit prices in competition with any other concern. We add that as our grades are from five to ten per cent higher in grade than ordinary stock and inasmuch as each car is shipped to fill the customer's individual requirements (such as stock for long rippings or short cuttings), we claim he can get more out of it, and for these reasons a comparison of prices is not fair or just. We shall be glad, we tell him, to demonstrate these facts by a sample shipment. This new policy had been in effect for only one day before our first order came in. We had taken it up with this man by telephone. The letter he sent in with the order stated he knew for a fact that our price was \$4.00 per thousand higher than the highest price he had ever heard of, but that he was confident that our stock would be as represented.

Shipping the stock this way is building for us a reputation and building a future. This is good merchandising, good policy and already it has demonstrated its practicability.

Exports and Imports for December

Advance sheets showing imports and exports for December, 1912, as issued by the Department of Commerce and Labor at Washington, show that exports of all wood and manufactures of wood aggregated \$8,503,196 during the month. This is compared to an export value December, 1911, of \$7,074,254, which is a distinctly favorable showing, considering the ocean freight rate situation.

The total export of logs and other round timber showed a gain from \$252,130 in December, 1911, to \$297,319 December, 1912. The total hewn and sawed timber exported gained from \$559,134 December, 1911, to \$895,575 December, 1912.

The total export value of manufactured lumber in the form of boards, planks, deals, joists, scantling, etc., was \$3,841,407 December, 1911, and \$4,683,188 December, 1912.

The total import value of wood and manufactures of wood aggregated \$5,044,786 December, 1911. The import value of mahogany increased from \$228,453 December, 1911, to \$709,131 December, 1912. There was a corresponding increase in the importation of other cabinet woods. The importation of pulp woods decreased in value from \$373,825 December, 1911, to \$343,530 December, 1912.

Manufactured lumber in the form of boards, planks, deals and other sawed stock was imported to the value of \$1,311,861 in December of last year. This was a slight increase over the preceding December.

The import value of wood pulp of all kinds decreased from \$1,442,997 December, 1911, to \$1,371,549 December, 1912.

Useless Hardwoods Will Have Value

Considerable interest has recently been aroused in the search for new woods suitable for shuttles. The supply of the two woods—dogwood and persimmon—which are used almost exclusively for this purpose both at home and abroad is becoming decidedly restricted. This is particularly the case with dogwood, which is considered the more desirable of the two. There is still considerable of the timber in the country, but it is so scattered that it is expensive to collect. Making shuttle blocks is an industry in itself and the ordinary lumberman cannot produce blocks to meet the rigid requirements of the manufacturers, due for the most part to lack of care in the process of seasoning. Consequently, unless there is enough timber in a place to make it worth the while of a block cutter, it will very likely go into other products. In parts of Maryland, for instance, there is considerable persimmon timber of fair quality, but the farmers have never heard of the shuttle market.

The requirements of a shuttle wood are very exacting. It must be highly resistant to wear and capable of becoming smoother with use. The shuttle is shot back and forth across the loom at very high speed and usually rests on nothing but the taut threads of the warp, so that it is very evident that the slightest tendency of the wood to roughen or check would render it worse than useless. The wear is considerable and a soft wood is soon worn out. The smoother a shuttle becomes the less friction it encounters and the longer it will last.

Woods with decided contrast between the two portions of the annual rings of growth cannot be employed. The springwood is considerably lighter and softer than that found later, and when subjected to wear the softer portions are worn down more rapidly, leaving the surface irregular. If used in a loom such projections would sooner or later catch in the warp and break it.

If a wood is too soft it will wear out too soon or become rough. If too brittle or too fissile it will not withstand the repeated blows of the pickerstaffs. If knotty it will wear down irregularly and cause trouble. If season-checked it will catch the threads of the warp in the cracks.

From these requirements it is evident that very few native woods could qualify. Almost every conifer would be ruled out at once because too soft or too uneven-textured or lacking in some important requirement. Yew has been tried but without success. Of the hardwood species the number of possibilities is greater and yet a close study of the properties of the various kind will eliminate over ninety-five per cent without actual trial. Moreover, it is not sufficient that a wood be found to meet the requirements, it must also exist in sufficient quantity to justify its employment.

The ideal shuttle wood is boxwood, but its scarcity and high price long ago prohibited its general employment for such purpose. Apple and pear wood gave good results, but the supply of the materials was so scattered and uncertain that they supplied the trade for only a short time. When dogwood and persimmon were found to fill the bill, there seems to have been no systematic effort made to determine if any other woods could be so employed.

One source of a great deal of trouble with both dogwood and persimmon is the large number of defects. Dogwood is mostly a small tree and quite full of knots. Persimmon grows larger but is equally defective from heart shake and black streaks. On an average, about two-thirds of every log has to be thrown away. The shuttle manu-

facturers discriminate against heartwood "because," in the language of an official, "a shuttle that is part heart is very liable to split along the line which separates the heart from the exterior wood, there being in many cases no permanent cohesion between the two sections." The tendency of the sapwood to split away from the heart is probably due to the difference in shrinkage in seasoning, the sapwood shrinking more. Persimmon heartwood becomes infiltrated with a black substance which leaves streaks of jet which behave quite differently from the rest of the wood. This tendency to blacken is carried to an extreme in the case of ebony (*Diospyros cbanum*) which is a brother to our own persimmon (*Diospyros virginiana*).

A wood well worth careful consideration is black gum (*Nyssa sylvatica*). The dry wood weighs about forty pounds per cubic foot as compared to forty-nine pounds for persimmon and fifty-one pounds for dogwood. Weight is not in itself essential except as it indicates strength, hardness and other properties. Black gum is fine-textured, the pores are small and diffused throughout the rings of growth instead of collected in bands. It is also tough and strong and appears to have the highly desirable property of wearing smooth. Its satisfactory use for rollers, floors, etc., indicates its wearing qualities. It is rather cross-grained and would have to be seasoned

carefully, but, for that matter, any shuttle wood must be seasoned with extreme care, so there need be no unavoidable difficulty from that source. Best of all, black gum is so plentiful and can be obtained in such sizes that if found suitable for shuttles a permanent supply at a reasonable price can be assured.

Another wood that gives even greater promise of being satisfactory in quality if not in quantity is the hornbeam or iron wood (*Ostrya virginiana*). It is a tree, occasionally from fifty to sixty feet high, with a short trunk two feet in diameter, though usually not more than twenty or thirty feet tall and with a trunk eighteen to twenty inches through. It is quite generally distributed throughout the

eastern half of the United States, though most abundant and of its largest size in southern Arkansas and Texas.

The wood of *Ostrya* is very heavy, hard, strong, tough, and difficult to split. The pores are too fine to be singly visible to the unaided eye, though near the outer edge of growth ring they are collected in small groups which appear as white dots. The pores are all small or minute, comparatively few in number, and arranged in irregularly branching radial lines. The rays are fine and indistinct. The color of the heartwood is light brown; the sapwood is very light with a pinkish hue.

The uses of this timber have been limited mostly to fence posts, mallets and homemade tool handles, levers, wedges and machinery parts. It would be particularly fortunate if it should be found valuable for shuttles, for it is common in nearly every woodlot throughout the hardwood region of the United States, and is generally considered a weed tree.

A prominent shuttle block cutter in Mississippi has recently cut a number of trees of blue beech (*Carpinus caroliniana*) and intends to make some sample shuttle blocks from them. He says the trees are plentiful and that they grow to a height of about sixteen feet to the first limb and have a very fluted or ribbed trunk.

Blue beech (also known as water beech, hornbeam, and ironwood) has much the same distribution and occurrence as hornbeam (*Ostrya*

FIVE OUT OF TWENTY-TWO STAGES IN THE EVOLUTION OF A SHUTTLE.

virginiana). The wood is hard, tough, rather difficult to split and about as heavy as black locust. The pores are comparatively few, very small to minute, those in the springwood in irregular groups which appear to the unaided eye as white dots, much the same as in *Ostrya*. The most characteristic feature of the wood is the large rays which are grouped and instead of running straight out from the pith, often curve to one side. This arrangement of the rays is believed to be responsible for the peculiar fluted or ribbed character of the trunk. They also interfere seriously with the process of seasoning, causing the wood to warp out of shape and to check. With care, however, it may be possible to make good shuttles out of it.

One of the most promising foreign woods for shuttles is the white quebracho (*Aspidosperma quebracho-blanco*) which is being imported in considerable quantities for various purposes. The tree is common in northern Argentina and other portions of South America. It is an evergreen hardwood, reaching a height of from sixty to one hundred feet and a diameter of from one to three feet. It is remarkable for its erect stem and wide-spreading crown. The wood is strong, close-grained, hard and very heavy, the weight of thoroughly dry material varying from fifty-five to sixty-three pounds per cubic foot. The color is yellowish white with a pinkish or rosy tint. The dense, uniform texture makes this wood suitable as a substitute for boxwood in certain uses and there is good reason to believe that it would make excellent shuttles at about the present cost of dogwood and persimmon.

The western dogwood (*Cornus nuttallii*), which is quite common in the redwood forests of the Pacific coast, has often been mentioned as a possible shuttle wood because of its close relationship to the dogwood of the East (*Cornus florida*). The tree is small, though averaging larger and of better form than the eastern form. The wood, however, is considerably lighter in weight and less dense. So far as known to the writer it has never been used for shuttles and deserves a trial. The great distance from the cotton and woolen mills would prove a handicap, though not too great to be overcome if there should be no other objection.

Mesquite (*Prosopis juliflora*) of the arid Southwest has been suggested, but it is usually of such poor form that perfect shuttle blocks would be very difficult to get. The wood is quite brittle, and if made into a shuttle would probably go to pieces in a short time. Moreover, the local demand for mesquite is already great enough to consume all that is grown.

If it should be found that there are no satisfactory substitutes for dogwood and persimmon, the sooner it is known the better in order that provision may be made for preventing the exhaustion of these woods. There seems no reason why both species could not be artificially propagated. The growth under favorable conditions is fairly rapid and the trees would become merchantable as soon as a stump diameter of seven inches is attained. The matter seems important enough to warrant a careful and thorough canvass of the whole situation.

The Co-Operative Spirit

Editor's Note

The following article was read by J. K. Williams of the Williams Lumber Company, Fayetteville, Tenn., before the Hardwood Manufacturers' Association of the United States in convention at Cincinnati, O., February 4 and 5.

Six years ago, at our meeting in Louisville, I was assigned the reading of a paper on a subject very similar to this. It was therein pointed out that from no unanimity of purpose nor concert of action amongst the mills they were absolutely at the mercy of the buyers, trudging along without rudder or compass; selling in the different markets under their respective rules and all of them made in the interest of the dealer (for one rarely sold a consumer then), so that greater profits were to be had in the manipulation of grades than from added prices; but that as a result of four years of association work, after consulting the wants of the consuming element, we had established rules of inspection, alike just to both sides, besides achieving many other things of the greatest benefit to the manufacturer. But, gentlemen, while we have accomplished much since then, have we reached the goal?

It is needless to use your time in the enumeration of all the ills that are daily met with. "Kicks" of every kind, charges of unfairness and partiality by our inspectors to our members; charges even that our organization is dominated by and run solely in the interest of certain big mills and, in fact, every disparaging thing that can be said is drawn from the plethoric vocabulary of the selfish element which is fighting us, and hurled at us.

Is it not evident then that there is this conflict of interest—this warfare of which I have spoken? Human nature is all powerful, and selfishness, condemned as the chief sin of Holy Writ, is so closely related to self interest—self preservation, universally recognized as the first law of nature—that it must be governed and held under tight rein that justice may follow. Therefore, while excusing the other side for their human proclivities, it is equally natural for the manufacturers to defend themselves and to contend for their natural rights, and the chief of these is the right to make their own rules of inspection.

It is rank folly to say that I cannot do as I please with what is my own. Why, then, cannot we manufacturers who own the lumber absolutely dictate the grades and terms of sale in the disposal of it? True it is that there are two sides to every question and equally true that it requires two to make a bargain; but

not necessarily more than two, and the two in this case are logically the manufacturer and the consumer. It is simply a question of horse trading. We, the sawmills, have our barns full of a great variety of animals and Mr. Consumer comes along and wants one. He knows his requirements and, being shown through, selects this one or that one in accordance therewith and strikes a bargain or goes elsewhere, conditioned upon the price and terms. The two only are concerned in the deal and if they can agree, what right has any outsider to interfere?

I contend, therefore, that the manufacturers are clearly within their moral and legal rights in making and promulgating through their organization their own grading rules, sales code and other policies for the marketing of their products, and I for one am opposed to any further efforts toward compromise. Policy may dictate that we should consult the consumer in an effort to please him and learn all we can of his requirements. That is merely good business, but not necessarily that he or any one else should dictate our grading rules and so far as my information goes he does not want to do so. He is satisfied when he gets the grade best suited to his line of manufacture, cheerfully pays for it and calls for more of the same kind.

I have no fight to make on the wholesalers as a class. They are as a rule substantial, high minded business men. I am arguing in the abstract for a principle, an unquestionable right of the manufacturer and am against only that considerable element amongst the wholesalers—those whose greatest profits result from grade stuffing. Those of us with mills of moderate output whose business will not justify regularly keeping traveling salesmen in the field must necessarily sell through the wholesaler who can and does make the personal canvass for trade and we find his legitimate profits to be much less, as a rule, than the cost of such salesmen. I do contend, however, that they have no rights in the making of grades for our lumber and that their proper function is the buying and selling of same, under established rules, on the legitimate profit of the difference between the cost and selling price; and I maintain further that if the upright ones amongst

them will join the manufacturers in their efforts to eliminate this reprehensible practice of grade manipulation, the better it will be for all concerned. There may be some manufacturers who resort to it, but if so they are not loyal members of this association and my remarks are equally applicable to them. It is deception. It is dishonest, false pretense and disreputable. Honesty is the best policy and grade blending is not such. Let it, therefore, be the chief effort of every fair minded lumberman, be he manufacturer, dealer or consumer, to crush it out.

The power of organization is what we need, and all the troubles and hardships we have to battle against are but measures of our weakness and show up the importance of more members and more loyal members until our influence as an organization is felt—even pinches a little, if you please—and then, and only then, can we win the battle and enjoy our just rights. Why, gentlemen, no argument is needed to convince you of what can be achieved by organization. Look around you and what distinct line of business of any magnitude do you find not organized? Certainly every line of manufacture of any importance is so and even we lumbermen feel the force of such in the harvester trust, though I am not advocating the formation of a trust, nor do I think it necessary. Witness also the steel trust and all the other gigantic trusts and combinations, which I mention merely to show the power of thorough organization and not as models for ourselves. But at any rate what they can and do accomplish is marvelous, and though their existence is dangerous, owing to the selfishness of human nature, it must be admitted that much good to the entire world results from their strength of organization and combined capital.

Some months ago, in a conversation with a fellow traveller, this question of organization was an interesting topic between us. He was a shoe manufacturer and told of the difficulties his organization had been fighting—such, for instance, as the labor problem, the strike question, costs, credit ratings, etc.—but especially was I impressed in his relating that after years of effort between the tanneries and themselves, the tanneries had established such well understood grades of leather that no difficulty was had in knowing just what to expect when an order was given. Manufacturer and consumer, don't you see?

Now why cannot we hardwood millmen do the same?

But these are not all the benefits to the manufacturer resultant from organization. Ours is a distinct line in many respects. The cost problem in its many phases is ever staring us in the face. Cost of production has been the great topic of discussion for many years, officially in the reading of papers on the subject and investigation, as well as socially in our annual gatherings and I speak from experience in saying that valuable ideas and the greatest benefit have resulted.

The selling cost, however, I fear has not received the same deserved attention. A man may spend years in reducing production cost 50 cents and let the selling cost increase \$1.50. I cannot speak for the larger mills who sell almost exclusively through their travelling men, but I do know that with us a very considerable selling cost results from frivolous complaints, requiring small concessions and when large enough to justify a reinspection, the excess over the small margin allowed by our rules is barely sufficient to put the cost on us, thus materially adding to the selling cost.

It seems to me that here is a field that right now should receive our best attention. The more direct and intimate the contact between the producer and the consumer, the less there will be of such expense; and if I may venture a suggestion it is that the best investment this association could make would be in putting a number of wisely selected, well posted men in the consuming field and keeping them there until the consuming element is so thoroughly familiar with our grading rules that when one orders a certain grade he will know exactly what he will get. And further, the work of these same men could be made greatly beneficial in studying the peculiar lines of manufacture by consumers and let such information be published through our bulletin as guides to the membership in making shipments.

I might mention many other advantages of organization pertaining solely to the manufacturer and the astonishing thing is why are they not all members of this association.

Is it because you are prejudiced from listening to defamatory reports, or because, in our infancy, you became members of another association and feel that we are still too weak to give you equal benefit? Then come in and give us your loyal support in suppressing false rumors and in bringing the manufacturers up to your highest ideals. We are all in the same boat. Our trials and difficulties are identical; our interests the same. Or possibly you are one of that class which I have heard of saying: "You adopt and establish one set of grading rules and I will join you." Foolish question and unfair! As well might the recruit say to the general of the army: "You go in and win the battle and I will share with you the victor's gain." Get in the ranks yourself and help win the battle and thus fit yourself for enjoying its emoluments with a consciousness of duty done.

And now in closing, let me urge every member to renewed loyalty in the support of every function of our association work. Stand firmly on our rules and let each one do all in his power toward the swelling of our membership until there is not a sawmill left out of the fold.

Lumbering in Jamaica

The island of Jamaica is not likely to attract many lumbermen from the United States while present methods of sawing lumber continue. The island's forest area is about 500,000 acres. It is remarkably rich in valuable hardwoods, 113 species having been listed, all of which are suitable for cabinet work, furniture, house finish, or some other useful purpose. Only a few of these woods are known in the United States. Mahogany, Spanish cedar, satinwood and rosewood are about the only ones with which woodworkers in this country are acquainted, although there are more than one hundred others ranging in value from rosewood down to crosstie timber. A recent consular report described conditions on this island with regard to lumbering. An extract follows:

There are no sawmills in Jamaica. The only sort of mill that could be operated to any advantage here would be a portable outfit, which could be easily transported from place to place. As there are no large bodies of well-timbered lands in Jamaica, and as much of the timber, which is mostly of small to medium size, is found on the hills and mountains, it would be difficult to operate a mill profitably. Under the conditions existing in this island, where labor is abundant and consequently cheap, the most practicable method of manufacturing lumber from native timber is to saw it by hand, as has been done since the first settlement of Jamaica. Where the slope of the ground is favorable, the logs are rolled upon a framework; otherwise a pit is dug, in which one man stands, while another stands above the log to operate the long rip saw. After ripping off slabs on two sides, the men line the log with a cord that is dipped in a chalk or charcoal solution. By such primitive methods they are able to saw boards of nearly uniform thickness. In the towns along the coast especially American pine is generally used in the construction of houses, but in the interior of the island there are many dwellings and other buildings, and some of considerable size, which have been built wholly of hand-sawed lumber. Mahogany boards are worth in the local markets from \$70 to \$80, cedar boards from \$50 to \$60, and framing material from \$25 to \$35 per 1,000 feet, prices that seem quite reasonable, considering the laborious method of producing this lumber.

The native woods in most common use for general building purposes are West Indian cedar, bastard cedar (*Guazuma tomentosa*), and bullit wood (*Dipholis montana*). Even when American pine is used for a building, the native woods are preferred for sills and sleepers, on account of their greater durability in this climate and their freedom from the ravages of ants and worms. Some of the native woods are so hard when seasoned that it is difficult to drive nails into them. The use of sapodilla (*Mimusops excisa*) for railway ties was abandoned because it was almost impossible to drive spikes into it.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 390—Seeks Bent Oval Rims and Veneered Panels

Hagerstown, Md., Jan. 24.—Editor HARDWOOD RECORD: We would like to know where we can get built-up or bent oval rims, figured quartered oak and mahogany. We buy in quantities, sizes 26 $\frac{1}{4}$ "x43 $\frac{1}{4}$ " and 26"x48".

The above inquiry is from a high-class furniture manufacturing house and its requirements should be of interest to producers of both bent and flat panels. Address on application.—EDITOR.

B 391—Wants Basswood, Oak and Poplar

Chicago, Ill., Jan. 27.—Editor HARDWOOD RECORD: We are in the market for 2 cars 1" plain red oak, 1 car quarter-sawn white oak, 2 cars of basswood and 1 car of poplar, upon which we will receive figures shortly.

B 392—In the Market for Black Gum

Liverpool, Jan. 8.—Editor HARDWOOD RECORD: We shall esteem it a favor if you will put us in communication with source of supply for black gum, as we are substantial buyers of black gum lumber and we have the following inquiries open at the present time:

Twelve cars tupelo or black gum lumber, to be shipped in quantities of about a carload a month from May-June next. The stock required is as follows: About 50 per cent No. 1 common and 50 per cent No. 2 common in each car, and we shall be glad to have the lowest prices for each grade, c. i. f. Liverpool, for the undermentioned unplaned stock:

Two cars $\frac{3}{4}$ ", 8 cars 1", 1 car 1 $\frac{1}{4}$ " and 1 car 1 $\frac{1}{2}$ ". If unable to quote on tupelo or black gum, please quote on sap gum.

Also quote on 200,000 to 300,000 feet of No. 1 common black gum boards 1" thick. The specifications of this stock are quite immaterial. We could take it in narrow widths and short lengths and delivery is required in, say, 2 to 3 cars per month during this year. Please quote c. i. f. Liverpool, less 2 per cent.

The above inquirer has been supplied with a list of several producers of black gum.—EDITOR.

B 393—Has Applewood to Market

South Bend, Ind., Jan. 30.—Editor HARDWOOD RECORD: We would be pleased to have you advise us of anyone you know that is handling applewood, or would be in position to buy same, and we would also be pleased to know what the market price is in this kind of wood.

Thanking you for advising us,

The above correspondent has been advised that the largest users of applewood are manufacturers of saw handles, and that these people, it is understood, have considerable difficulty getting enough of this material to meet their requirements. He has been supplied with a list of a few large producers of handsaws.

Regarding the price of this wood, the inquirer has been informed that reports on applewood used in Michigan during 1911 show that the average price was \$50 a thousand feet during that year. While this price was based on feet, board measure, applewood is sold by the cord, it being figured on a basis of ninety cubic feet to the cord.—EDITOR.

B 394—Wants Glued-Up Dimension Stock

Brooklyn, N. Y., Jan. 30.—Editor HARDWOOD RECORD: Would you kindly send a list of firms who are in a position to manufacture glued-up dimension stock to be used for plumbers' woodwork? The lengths are very short, running from 6" to 10" wide, to be made of $\frac{1}{4}$ " and $\frac{5}{4}$ " stock, and can be either ash, oak or chestnut. Terms, 2 per cent 10 days.

We would appreciate very much any information you may give us on this line.

The above has been informed of various sources of supply for this material.—EDITOR.

B 395—Wants Flag Sticks

Saginaw, Mich., Jan. 31.—Editor HARDWOOD RECORD: Can you refer us to someone who makes a specialty of getting out flag sticks? We want some sticks 30" long and $\frac{3}{8}$ " in diameter.

Any information you can give us will be greatly appreciated.

This prospective buyer of flag sticks has been given the names of a few concerns manufacturing such material.—EDITOR.

B 396—Wants Taped-up Quartered Oak Veneer

The following letter has been received from a large manufacturer of veneered doors and panels located in San Francisco:

San Francisco, Cal., Feb. 3, 1913.—Editor HARDWOOD RECORD: We are in the market for a large quantity of taped-up quartered oak veneer, sawn either 1/16" or 1/20". If we cannot secure this sawn, we may be compelled to take it sliced, but we want it taped up. We should like this nicely figured and free from sap and other defects. Our sizes would be as follows: 25"x62", 25"x74", 31"x74", 37"x74".

Will you therefore kindly give us a list of a number of manufacturers who could get this material out for us ready to lay?

Thanking you for many favors received at your hands and thanking you in advance for the information, we are
A. Co.

B 397—Wants Gum for Export

LIVERPOOL, ENGLAND, Jan. 29.—Editor HARDWOOD RECORD: Kindly put us in touch with some shippers who can undertake an order for sap gum 3 $\frac{1}{2}$ "x12" or 14" wide. We can place orders up to 100,000 superficial feet. Shippers would have to quote c. i. f. Liverpool. Care would have to be taken that the stock keeps flat.

News Miscellany

National Exporters' Annual

The thirty-eighth annual convention of the National Lumber Exporters' Association was held at Chattanooga, Tenn., on Jan. 23. There were about fifty in attendance.

President Dixon reviewed the work during the preceding year and stated that the association would undoubtedly become a powerful factor in American lumber export business.

Secretary McDonald Price, Baltimore, read his annual report, which showed a record of a large amount of work transacted through his office.

The report of Treasurer J. L. Alcock of Baltimore showed the finances of association to be in good condition.

The report of the railroad committee told of the detaining by railroads of cars of lumber along the rights of way. Rates on lumber shipments were touched upon and were later discussed and resolutions passed demanding lower rates. The report of the arbitration committee pointed out the differences that have been settled between the members of the association and foreign buyers, while the membership committee reported that the association has grown since the last meeting.

A special committee then reported on uniform ocean bills-of-lading. The committee stated that good progress has been made in the matter of creating such bills and that it is anticipated that the matter will be completed during the coming year. The United Kingdom contract was also discussed in the report of this special committee. The report showed no material change in the matter of securing a friendly agreement between shippers on this side and consumers in the United Kingdom.

The remainder of the morning session was taken up by reports of the demurrage and car service committees, and motions and questions arising out of the address of the president and other reports.

Transportation was the topic commanding most attention in the afternoon session. No definite action was taken more than to protest against present methods of making lumber deliveries. Another subject discussed was that of ocean freight rate advances.

Annual of Pennsylvania Lumbermen's Association

The twenty-first annual meeting of the Pennsylvania Lumbermen's Association was held at the Hotel Walton, Philadelphia, Jan. 29 and 30. President C. F. Williamson was in the chair.

Directors' and committee meetings occupied the morning of the first day. The general session opened in the afternoon and after the usual routine, a discussion of the adjustment of freight claims was opened up by Frederick Pyfer of Lancaster, Pa. Mr. Pyfer urged the members to keep a record of claims and present them immediately to the railroads before the evidence is destroyed. By so doing it will be found that the carrying company will constantly give prompt attention to complaints, and satisfactory adjustments will be made.

J. W. Kraft of Ambler spoke on the "Expediency and Efficiency of Delivery." He said that the only hope for improvement is by displacing the horse and wagon with the motor truck. The first cost is soon offset, according to the speaker, by immense saving in delivery. Naturally by cutting down delivery cost, the honest dealer will eventually be able to lower his price proportionately. The speaker's recommendations as to the use of motor trucks in retail hard work were heartily endorsed by all who had used automobiles in delivering.

Other subjects discussed were "Credits and Collections," delivered by M. P. Cooper, and "Care and Feeding of Horses," by Henry Palmer. John A. Lloyd spoke on the "Relation of Competitors."

At the afternoon session Sidney Clemmons of Chicago read a paper on "Community Development." He was followed by a discussion on lumber association benefits. Omer M. Bruner of Philadelphia was to speak from the viewpoint of the wholesaler and J. S. Hess was to give the retailer's side of association work. In the absence of Mr. Bruner, his paper was read by Frederick S. Underhill, Philadelphia. Mr. Underhill prefaced

the paper with a few remarks of his own, which, together with the paper, very favorably impressed the retail listeners. Mr. Hess, speaking for the retailers, said that the question had been put to them in a different light than ever before.

Demurrage matters occupied discussion at the opening of Thursday's session. There was also a talk on the utilization of the blight-killed chestnut trees. John P. Wentling of the Chestnut Tree Blight Commission delivered this talk and said that blight-killed chestnut can be utilized, if cut soon after its death, for various purposes.

At two p. m. on Thursday, those in attendance at the convention were served with a luncheon. The principal speaker was the Honorable William Hodges Mann, governor of Virginia. Dr. Joseph S. Dixon also spoke. The luncheoners were presented with suitable souvenirs.

Semi-Monthly Meeting Memphis Lumbermen's Club

James E. Stark, chairman of the law and insurance committee of the Lumbermen's Club, scored the statement recently prepared by the board companies showing premiums paid and losses experienced by the lumber and woodworking industry of Memphis. He said that the statement would not show anything like the total of the premiums paid by the lumber firms, and that the greater portion of the loss ascribed to lumber firms had been incurred in connection with woodworking enterprises not directly identified with the lumber industry. It was shown that the total premiums paid by lumber firms amounted to \$86,306 per annum for the past ten years and that the losses paid in the meantime had been \$564,357.41. It was shown, however, that the woodworking enterprises which paid premiums of only \$14,000 per annum had experienced losses of \$369,970.27. This left the actual lumber companies with losses of only \$194,387.14 after paying premiums of \$86,306 per annum, or \$863,060 for the entire period of ten years. Mr. Stark thought that the insurance companies were making a little money out of the insurance carried for lumber firms, and reiterated his belief that if the lumbermen kept up the fight it would be possible to demonstrate to the insurance companies that the rates were entirely too high on lumber insurance for Memphis.

It was suggested that the secretary of the club send out to all lumbermen of Memphis requests for accurate information as to the amount of premiums paid and losses experienced during 1912. It is hoped, by this means, to compile an accurate statement to be used as a basis in further efforts in the direction of securing lower rates.

The special committee appointed to take up with the management of the new Chieca hotel the subject of finishing this structure in red gum instead of birch reported that the outlook was reasonably favorable. It will depend upon what the difference in cost is as between birch and red gum. It is likely that the red gum manufacturers here will make up the difference if it is not found to be too large. It is proposed to use the red gum in its natural state so that it will show the high capabilities and possibilities of this material as a finishing proposition. The report was accepted and the committee was instructed to continue negotiations.

There will be certain changes made in the method of electing officers of the club if the report made by the special committee appointed for that purpose is adopted. The old campaign will be eliminated and the nomination of officers and the election itself will occur the same evening, this proving a feature of the annual banquet. These changes, however, can not be voted upon until after the thirty days' notice required by the constitution.

John W. McClure of the river and rail committee called the attention of the club to the fact that there would be two important hearings before the Interstate Commerce Commission within the near future. The first is to occur at St. Louis, Feb. 10, and is to cover the proposed advance of two cents per hundred pounds from Louisiana and Arkansas to points in Missouri, Kansas and Nebraska. The second is to be held at Memphis and is to deal with the advance on rates on hardwood shipments from Louisiana and Arkansas points to Memphis and from Memphis and Mississippi river points to New Orleans. Mr. McClure thought it was highly important that, while these hearings are to be looked after by the Southern Hardwood Traffic Bureau, the lumbermen themselves should attend in as large a body as possible to the end that the right sort of interest might be indicated in the proposition. He thought the moral effect of such a course would be quite good. In making his report Mr. McClure took advantage of the opportunity of complimenting the Southern Hardwood Traffic Bureau on the excellent work which it is doing in behalf of the hardwood lumber industry.

D. H. Hall of the D. H. Hall Lumber Company, New Albany, Miss., was elected an associate member, and William Pritchard of the John M. Pritchard Lumber Company was elected an active member.

Meeting of Cincinnati Lumbermen's Club

The regular monthly meeting and dinner of the Lumbermen's Club was held at the Business Men's Club, Feb. 3. About twenty delegates to the convention of the Hardwood Manufacturers' Association of the United States were guests at the meeting. After a very toothsome beefsteak dinner was much enjoyed by all present, President Shiels called upon ex-Presidents W. B. Townsend and R. M. Carrier of the Hardwood Manufacturers' Association. Both of these gentlemen responded briefly and then asked to be excused because of other business requiring their attention.

After the reading of the minutes, President Shiels introduced Thos. E. Hanlon of the Employers' Liability Assurance Corporation, who spoke at length on the bill now pending before the Ohio State Legislature,

called The Workmen's Compulsory Compensation Act, which seeks to place a very serious burden upon the employers of labor in this state and, if passed, would practically wipe out casualty insurance in the state and give the state a monopoly that is considered very unjust, and the provisions for the alleged protection to employes, irrespective of the rights of employers, have stirred merchants and manufacturers to make a very strong protest against the enactment of any such drastic legislation. The club passed a resolution requesting the framer of the bill, Senator W. M. Green, also the chairman of the Hamilton county delegation, Hon. Thornton R. Snyder, to postpone final action on the measure for at least sixty days, to give employes an opportunity to investigate the proposition thoroughly. The secretary was ordered to send copies of the resolution to both of these gentlemen and also to Governor Cox, asking him to use his influence to have the matter delayed. In addition to this action, there will be a large delegation of prominent business men at Columbus on Wednesday to protest against the measure. Anticipating a postponement, the club appointed a committee of three, consisting of W. S. Sterret, C. L. Smith and Fred Mowbray, to investigate the bill as proposed and to report at the next club meeting.

An invitation from the National Wholesale Lumber Dealers' Association, inviting the members of the club to attend its convention at Atlantic City, March 6 and 7, was read, and President Shiels appointed W. A. Bennett, T. J. Moffett and A. Schmidt to represent the club at this convention.

After the conclusion of business, the balance of the evening was devoted to talks by a number of the visitors who were called upon by President Shiels.

Builders' Exchange Organizes at Roanoke

The Builders' Exchange has been organized at Roanoke, Va., and occupies a centrally-located three-story building fitted up with every convenience for its members and patrons. The membership is over sixty at present and comprises the leading architects, contractors, sub-contractors, supply dealers, and the principal manufacturing interests of Roanoke and adjacent territory.

The first floor of the building is in use for exhibit purposes, there being about forty exhibits of all kinds of building material. In fact, everything is shown which enters into construction and the finishing of buildings. The second floor is given over to reading and writing rooms, estimating and consultation room, an auditorium, while the third floor is divided up into suitable offices to accommodate some of the members.

Traffic Matters Around Memphis

J. H. Townsend, manager of the Southern Hardwood Traffic Bureau, is authority for the statement that the steamship companies and the railroads west of the Mississippi river, with the exception of the Southern Pacific, have reached an agreement whereby through bills of lading on export shipments of lumber will be issued after March 3. Mr. Townsend has not received all the details of the adjustment as between the steamship companies and the railroads but it is understood that the western lines will issue export bills on much the same terms as the lines east of the Mississippi. The eastern roads have been requiring the engagement of steamship room out of New Orleans and other ports before issuing through bills and the western lines will require similar action on the part of exporters of lumber as well as other commodities. This will necessarily entail some delay in the handling of export shipments, but it is regarded as infinitely better than to handle lumber on local bills to ship side. Lumbermen are therefore very much pleased with this arrangement as it is felt that it will greatly facilitate the movement of lumber to the ports and thence to Europe.

The Southern Pacific is still holding out and it is said by Mr. Townsend that the case of the Anderson-Tully Company, brought for the purpose of securing an order from the Interstate Commerce Commission, making it compulsory upon the western lines to issue through bills of lading, will be continued. None of the other lines will be party defendants to this action. The lumber exporters here are very anxious to secure a ruling from the commission on this point and they are likewise anxious to have the Southern Pacific in line with other roads in connection with the subject of through bills of lading.

There will be a hearing at St. Louis, Feb. 10, in connection with the proposed advance of two cents per hundred pounds on shipments of hardwood lumber and lumber products from points in Arkansas and Louisiana to destinations in Missouri, Nebraska, and Kansas. There will also be a hearing at Memphis Feb. 13, in connection with the proposed advance of two cents per hundred pounds on shipments of hardwood lumber and lumber products from points in Arkansas and Louisiana to Memphis and from Memphis and Mississippi points to New Orleans. Lumbermen of Memphis will appear at both hearings and the cases will be managed by the Southern Hardwood Traffic Bureau. The lumbermen of this point and throughout the Memphis territory will co-operate with the officials of this organization and it is certain that a large delegation of lumbermen will attend as interested auditors or as witnesses.

J. H. Townsend has recently returned from Washington, where he went following the hearing at Cincinnati. He went to the capital city in connection with important rate matters and is quite busy making the necessary arrangements for the hearings already scheduled.

Northern Cut and Shipments for 1911-1912

The Northern Hemlock and Hardwood Manufacturers' Association has issued a statement of the cut and shipments of hardwood and hemlock

Jan. 1 to Dec. 31, 1911 and 1912. The report shows that there was a decrease in hardwood cut during 1912 as compared with 1911 of 10 per cent. On the other hand, there was an increase in hardwood shipments of 23 per cent. The decrease in hemlock cut during the same periods was 8 per cent and the increase in hemlock shipments 30 per cent. Thus the total decrease in hardwood and hemlock cut of 1912 as compared with 1911 was 9 per cent, and for the same years there was an increase in total shipments of 28 per cent.

During 1912 hardwood shipments exceeded hardwood production by 21 per cent and hemlock shipments exceeded hemlock production by 36 per cent; thus shipments of hemlock and hardwood combined exceeded production by 30 per cent.

The total stock of hardwoods held by sixty firms, sold and unsold, was, Jan. 1, 1912, 119,744,000 feet, and on Jan. 1, 1913, was 79,060,000 feet, a decrease of 34 per cent. The total hemlock stocks held by the same firms was, Jan. 1, 1912, 300,619,000 feet; on Jan. 1, 1913, 195,490,000 feet.

The proportion of total hardwoods on hand sold Jan. 1, 1912, was 45 per cent, and for Jan. 1, 1913, was 49 per cent.

Smithsonian Annual Report

The report of the Smithsonian Institute of Washington, D. C., for 1911 has been published. These reports are looked for each year by scientists who find in them summaries of progress during the preceding year in all lines of research. It is a sort of bringing up-to-date, a checking off, of the work of the world's greatest workers and thinkers. Among other interesting discussions and conclusions are these: Photographs by ultra violet light will show black as white and white as black; that there is only one known wild pigeon remaining in the world; that the age of the earth is between eighty and ninety million years; that some stars are so far away that their light requires 10,000 years to reach the earth, and that all stars are in motion; that the first use of iron seems to have been about 1,800 years B. C., and originated among the Mediterranean islands, probably in Crete; that some progress is being made in discovering the kind of oil used by the firefly to produce light; that forests once grew hundreds of miles north of the Arctic circle; and that the Kabyles of Africa are really white people tanned black by the sun.

Chicago Association Elects New Officers

On Monday, Jan. 27, the board of directors of the Lumbermen's Association of Chicago held a meeting for the purpose of electing officers for the ensuing year. F. L. Brown retired from two years of useful service as president of this association, and was succeeded by Murdock MacLeod of the Oconto Company.

V. F. Mashek was elected vice-president in place of Mr. MacLeod, while George J. Pope and E. E. Hooper were again elected treasurer and secretary, respectively.

After the election, President MacLeod called a meeting of the directors, in which they passed a resolution on the death of George Farnsworth of the Oconto Company.

Combined Interests

The Advance Lumber Company of Cleveland, O., and the West Virginia Timber Company of Charleston, W. Va., have just completed arrangements whereby the affairs of both companies will be materially increased. These two concerns are closely linked in a financial way.

The Advance Lumber Company is increasing its capital stock from \$331,000 to \$500,000. This will result in practically eliminating the wholesale and retail end of the business. As it is planned the Advance Lumber Company will then become the holding company of a number of important smaller concerns. Among these is the Baskin Lumber Company, Baskin, La., which concern now holds about 27,000 acres of yellow pine and hardwood timber.

The West Virginia Timber Company has headquarters at Charleston, W. Va., and mills at Vaughan, same state, and owns about 10,000 acres of timberlands in the vicinity of its mill. The principal growth is oak, poplar, chestnut and hickory.

The Horse Creek Lumber Company is another of the subsidiary concerns to the Advance Lumber Company. This company's operations are in Boone and Nicholas counties, W. Va. The Horse Creek Lumber Company controls 14,000 acres of hardwood timberland in the vicinity of Altman, W. Va.

This merging of interests will give to the organization a daily output of approximately 150,000 feet of hardwood, while the timberland acreage will, in the aggregate, be sufficient for ten years' cut.

George E. Breece of Charleston, W. Va., will be president both of the holding company and the West Virginia Timber Company. A. G. Webb of Cleveland will be vice-president and treasurer of both companies with his office at Cleveland.

The Porter Lumber Company Incorporated in West Virginia

The Porter Lumber Company is the style of a new incorporation which has started operations in the state of West Virginia. The company will manufacture lumber on a single band mill which is located at Chelyan, W. Va., on the main line of the Chesapeake & Ohio.

The company owns 17,000 acres of timber running mostly to oak and poplar. The balance is the regular proportion of West Virginia hardwoods. The mill will start cutting about April 1. The annual output of the plant will be in the neighborhood of 10,000,000 feet.

Hearing on Hardwood Rates from the South

The proposed hearing, which will be inaugurated by the Interstate Commerce Commission to take evidence in the investigation as to the reasonableness of asked for advances in rates by curriers on hardwoods from Arkansas, Louisiana and other southwestern points to Memphis, St. Louis and other points of destination, is being held at the Hotel Jefferson, St. Louis, Mo., today.

Committees for Wisconsin Association, 1913

President Hamar of the Northern Hemlock and Hardwood Manufacturers' Association has appointed the following committees on association work for 1913.

RAILROAD COMMITTEE.—W. G. Collar, Merrill, Wis., chairman; Murdock MacLeod, Chicago; Thomas Noble, Marquette, Mich.; W. J. Kessler, Eau Claire, Wis.; J. H. Johannes, Wausau, Wis.

LEGISLATIVE COMMITTEE FOR WISCONSIN.—W. A. Holt, Oconto, Wis., chairman; A. L. Osborn, Wausau, Wis.; C. H. Warden, Masou, Wis.; H. W. Moore, Fond du Lac, Wis.; H. H. Stolle, Tremoli, Wis.

LEGISLATIVE COMMITTEE FOR MICHIGAN.—T. A. Green, Ontonagon, Mich., chairman; John Pryor, Houghton, Mich.; R. E. MacLean, Wells, Mich.

ADVERTISING COMMITTEE.—M. P. McCullough, Schofield, Wis., chairman; W. B. Earle, Hermannsville, Mich.; J. W. Kaye, Westboro, Wis. E. J. Gillouly of Mellen, Wis., has been reappointed association auditor.

Panama Beetles Damage Veneer Logs

Last summer a shipment of logs from the west coast of Panama arrived at the plant of the Astoria Veneer Mills & Dock Company on the East river, Astoria, N. Y. In a short time millions of flying beetles were hatched from the cargo and circulating among the logs, and the yards of that company have sustained damages to the extent of between \$10,000 and \$25,000. As a result the Astoria Veneer Mills & Dock Company instituted a suit before the Queens County Supreme Court of Long Island, and asked damage from the shipping brokers handling the cargo, and also cancelled its contract with that concern, which contract gave it the privilege of storing its Panama timber shipments in the yard of the Astoria company.

Several other veneer concerns situated in the Astoria district adjacent to the Astoria veneer mills also experienced some damage from the depredations of the beetles. Among these were the George D. Emery Company, Utegrove & Beckwith, Inc., Lewis Thompson & Co., J. J. Bonneau Company and E. L. Siasabangh.

State entomologist, E. P. Felt, in testifying, said that the scientific name of the beetles is *platypus punctulatus*. They are about one-eighth of an inch long and enter the logs through pin holes, but once inside they begin to make themselves at home by fitting up a series of chambers in which they lay their eggs. The complainants testified that if the beetles had been left to themselves they would probably have eaten up hundreds of thousands of dollars' worth of logs.

The cargo which brought the pest was of a wood somewhat resembling mahogany, which the shippers were anxious to have tested in the United States. The first cargo was received July 19, 1912, and by August 15 the whole lumber district was swarming with flying beetles. They were traced to the cargo of logs from Panama. For a short time the veneer mills were compelled to shut down, and before they got through with the pest it was found necessary to steam all the wood. Some of the yards threw their lumber overboard alongside the dock, and saved it by submersion. Liberal application of petroleum and the cold weather put an end to the pest, and the state entomologist testified that it is not likely they will make themselves felt again next spring.

Statement Lumbermen's Underwriting Alliance

The financial statement of the Lumbermen's Underwriting Alliance, U. S. Epperson & Co., attorney-in-fact, Kansas City, Mo., shows that organization to be in an excellent condition.

The company has assets on hand aggregating \$871,252.43. Of this cash in banks amounts to \$514,721.36, and the rest is made up of bond investments, including bonds of the state of Louisiana, the city of Dallas, Texas, Kansas City Terminal Railway, Sedgewick County, Kansas, city of Omaha, Neb., city of Los Angeles and Canada Southern Railway Company. Accounts receivable, deposits in course of collection, etc., on Jan. 9 aggregated \$100,169.32.

MURDOCK MACLEOD, NEW PRESIDENT
CHICAGO LUMBERMEN'S ASSOCIATION

On the other hand, claims unadjusted are estimated at about \$8,804.11; administrative expenses aggregate \$19,625.22; surplus and re-insurance reserve amounts to \$842,823.10, making a total of \$871,252.43.

A summary of the percentage of operating expenses and fire losses shows operating expenses, twenty per cent; fire losses, twenty-two per cent; percentage saved to subscribers, fifty-eight per cent.

At the close of the fiscal year insurance in force at the Alliance was \$26,325,502.22. The loss claims paid aggregate \$117,001.98. This, with unadjusted claims, made the aggregate loss claims \$125,806.09. The net increase in insurance in force over the previous year was \$2,473,825.33.

The items of "surplus and re-insurance reserve" amounting to \$842,823.10, if divided as the law requires of stock companies, would be: Re-insurance reserve, \$287,263.86, and surplus to the credit of the Alliance policy carriers, \$555,559.24.

A gratifying feature of the record-breaking loss ratio is the fact that few Alliance subscribers suffered heavy individual losses that attend disastrous fires, and of all the sawmills insured by the Alliance only two were burned during the year, all the other losses being of minor consequence.

Building Operations for January

Official reports from some fifty cities throughout the United States, as compiled by The American Contractor, Chicago, show an aggregate gain in building operations of 12 per cent for January, 1913, as compared with January of the past year. Thirty-six of the cities listed scored an increase and fourteen a decline from the January 1912 figures. Gains of over 100 per cent were made in: Cedar Rapids, 166 per cent; Chattanooga, 122; Chicago, 252; Cleveland, 114; Columbus, 108; Detroit, 236; Manchester, 139; Milwaukee, 381; Nashville, 198; Newark, 124; St. Joseph, 147; Scranton, 207; Toledo, 227. Particulars will be found in the following table:

CITY—	January 1913 Cost	January 1912 Cost	Per Cent Gain Loss
Akron	208,230	121,450	71
Atlanta	395,005	294,295	34
Baltimore	635,670	460,166	38
Birmingham	362,626	243,277	49
Buffalo	478,000	427,000	11
Cedar Rapids	143,000	50,000	166

Total	\$38,071,007	\$33,732,915	12

Will Build Sawmill

The H. B. Blanks Lumber Company, whose headquarters are at Brunswick, Miss., with branch offices and distributing yards at Cairo, Ill., and Vicksburg, Miss., recently purchased from the Issaquena Land & Lumber Company a large tract of land for \$83,000. The company will erect a sawmill near Cary, Miss., at a new town to be known as Issaquena, located on the Yazoo & Mississippi Valley road. A railroad is being built through the property.

Opens Wholesale Department at Detroit

The Yeomans-Diver Company has added a wholesale lumber department to its already extensive box and crating business at Detroit, Mich. The new department will be under the management of President John M. Diver, who prior to 1901 was connected with the old Cleveland Saw Mill Company of Cleveland, O., and recently resigned as president and general manager of the Cleveland-Sarnia Sawmills Company, Ltd., of Sarnia, Ont., which corporation he entered in 1901.

The new company will handle all kinds of lumber from the southern and western states as well as white pine, Norway and spruce from

Canada, and special bills of lumber, lath and shingles.

Mr. Diver is well-known to the lumber trade throughout the United States and Canada, and his successful handling of his former duties assures him a success in the new undertaking.

The company's property is situated at the foot of Lieb street, Detroit, and covers an area of about four acres.

Insurance Company Makes Good Showing

At the annual meeting of the Pennsylvania Lumbermen's Mutual Fire Insurance Company, held in the company's office in Lafayette building, Jan. 28, the following directors were elected for a term of four years: Edwin H. Coane, R. R. Griswold, Wm. O. Curtis.

The auditors elected were: Emil Guenther, Myron J. Kimball, Clayton W. Nichols.

The officers elected for the year 1913 are as follows:

- PRESIDENT, Edward F. Henson.
- FIRST VICE-PRESIDENT, Richard Torpin.
- SECOND VICE-PRESIDENT, W. Z. Sener.
- TREASURER, Edwin H. Coane.
- ASSISTANT TREASURER, James S. Young.
- SECRETARY, Harry Humphreys.
- MANAGER AND ASSISTANT SECRETARY, Justin Peters.
- ASSISTANT MANAGER, H. J. Pelstring.

Last year was the best year in the history of the company for new business. The amount written was over \$2,500,000, making insurance in force about \$19,000,000. The surplus was increased \$34,000, making present surplus \$376,048. The directors advised and ordered the continuance of a 40 per cent dividend on all policies that will expire or terminate during the year 1913. The prospects for the year 1913 are very bright. January has shown up exceptionally well for new business. The statement of the company as of date Jan. 1, 1913, follows:

STATEMENT, JANUARY 1ST, 1913

CASH ASSETS	
Approved Stocks and Bonds	\$ 500,390.00
First Mortgage Loan on Real Estate	3,500.00
Cash in Office	634.25
Cash in Banks on Interest	73,560.96
Premiums Due (not over 3 months in arrears)	26,841.26
Agent's Balance	733.08
Interest Due or Accrued	7,160.66
Total Cash Assets	\$ 612,820.21
LIABILITIES	
Losses in process of adjustment	\$ 23,750.27
Taxes and other bills due or accrued	4,776.76
Inspection charges due on premiums in course of collection	1,614.61
Unearned premiums on policies in force	206,629.94
Total Liabilities	\$236,771.58
NET CASH SURPLUS	\$ 376,048.63
ASSETS AS TO POLICYHOLDERS	
Total Admitted Cash Assets	612,820.21
Less Liabilities, except unearned premiums	30,141.64
	\$ 582,678.57
Contingent Assets, i. e., extent of power to assess	1,239,779.64
Making total strength back of policies in force as of this date	\$1,822,458.21
Insurance in force	\$18,924,111.23
Premiums in force	\$ 413,250.88

Pease-Strang

George D. Pease and Miss May Caroline Strang, daughter of Mr. and Mrs. R. S. Strang of Chicago, were married on Feb. 1, by the Rev. William Chalmers Covert of the First Presbyterian Church of Chicago. Mr. Pease is at the head of the circulation department of the AMERICAN LUMBERMAN, having been in the employ of that organization for a considerable length of time. He started his business career in the employ of one of the papers which was eventually amalgamated with one other publication, to form the present organization.

Mr. Pease, or as he is more popularly known, "Jack" Pease, has an extensive coterie of friends in the lumber trade, who will unite in offering congratulations.

Death of Herman H. Hettler, Jr.

Herman H. Hettler, Jr., son of Herman H. Hettler, head of the Herman H. Hettler Lumber Company, Chicago, died at St. Lukes Hospital, Chicago, on Saturday, Feb. 1, after an illness of a week following an operation. The funeral was held on Monday, Feb. 3, from the family residence, 567 Hawthorne place, Chicago. The interment was at Graceland Cemetery.

The deceased was graduated from the Chicago Latin School and would have entered Yale University next fall.

New Louisiana Hardwood Concern

The St. Landry Realty Company has been formed at Port Barre, La. It will manufacture hardwoods and give particular attention to the export trade. C. E. Borah is president of the new concern; Joseph Birg, vice-president; George D. Palfry, secretary; H. S. Palfry, treasurer, and A. J. McCausland, general manager. These with John D. Bell, A. M. Underwood and S. W. Futral, comprise the board of directors. Mr. McCausland has had many years' experience in this line of trade.

The company owns about 18,000 acres of timber made up of white ash,

red and white oak and red gum, this including the timberland recently purchased from the old Port Barre Lumber Company.

The mill will soon be erected, and it is expected will be ready for operation in about ninety days, with a daily capacity of 60,000 feet.

Harvard Forestry School Bulletin

The official register of the Harvard University School of Forestry has just been issued from that institution. The register contains notices of the arrangements whereby pupils may gain access to the Harvard School of Forestry. It reviews the Harvard curriculum which covers two years and is designed to give the student a thorough course in technical forestry. Membership in the school of forestry is open to graduates of colleges or scientific schools. The curriculum includes various subjects covered in the usual course of forestry and intermixed with it are excursions on the part of the students to various woodlands adjacent to Cambridge. The school has been donated several tracts of timber, on one of which it runs a sawmill and maintains a lumber yard, the students camping at the operations.

Purchases Large Tract of Timber

The holdings of the Wayne Land & Lumber Company and the property of the Williamsville-Greenville & St. Louis Railroad, lying in Wayne county, Mo., have been purchased by a syndicate of Canadian lumbermen. Eighty-six thousand acres of iron ore land and hardwood timberland go with the deal.

The new company is composed of James W. Sanderson of Vancouver, John and Donald McLean of Winnipeg; E. N. Mayland, Winnipeg; H. W. Laird, Regina; Robert Slowe, Montreal; L. F. Woodman, Toronto; Thomas Rogers, Mexico, Mo., and D. W. Adams, Prince Albert, Alberta.

The holding company will be organized at Montreal, which will own the Wayne Land & Lumber Company and the Williamsville railroad. The company will be backed with sufficient means to operate the two properties, and it will also have the power to dispose of them if such a course seems best.

The property lies east of the Iron Mountain Railroad in Wayne county, and the road extends from Williamsville through Greenville to Cascade, Mo. The property has been developed at times by the Holliday-Klotz Lumber Company, and later by R. A. Long of Kansas City. Several productive mines are open on the property, and for a time ore was shipped to furnaces in St. Louis. In 1910, Mr. Long sold to C. W. Hayes and James Cowan, both of whom now retire from interest in the property.

It is said that the new company liquidated all obligations of the two concerns and acquired the property for less than \$200,000.

The Passing of a Veteran

George Farnsworth, retired president of the Oconto Company and the Bay de Noquet Company of Oconto, Wis., and Chicago, and Nahma, Mich., respectively, passed away at his home in Chicago on Jan. 26, 1913. Mr. Farnsworth was one of the pioneers in the white pine industry, and operating in this line and later going somewhat into the production of hardwood and hemlock, he became one of the strongest and most widely recognized of the old school of northern lumbermen. While essentially a white pine operator, the deceased, through his interest in the Oconto Company, was generally known throughout the northern hardwood manufacturing sections.

Mr. Farnsworth was born May 22, 1825, at Fairfax, Vt. He was descended from Anglo-Saxon and Scottish parentage, and in addition to receiving a tribute of courage and foresightedness, he also received as a heritage from his father the lumberman's instinct. The father of the late deceased was at one time occupied in rafting timber from Lake Champlain to the Montreal and Quebec markets.

George Farnsworth was at an early age forced into the world to make his own way. He started his commercial life in a village store at Burlington, Vt. At the age of fifteen he came west, and after considerable knocking about he again secured employment in a small store. Eventually he landed at Racine, Wis., and found employment in a lumber yard. In the course of time he was taken into the office. At the age of nineteen he bought the yard and went into partnership with Horatio Munroe. His partner retired at the end of the first year, which was profitable, and Mr. Farnsworth then went into the sawmill business at Muskegon, Mich. The succeeding years were marked by investments in timberlands and gradual advancement in his manufacturing interests. In 1858 he bought a half interest in a mill at Oconto, Wis. The company was later incorporated as the Oconto Company, with Mr. Farnsworth as its first president. He held this office until 1886 when he retired from active business life.

The Bay de Noquet Company was a subsequent enterprise, of which Mr. Farnsworth held the titular office of president.

The deceased lived at 1421 Astor street, Chicago. He leaves a wife, one son and three daughters. His son, George J. Farnsworth, is now president of the Oconto Company.

Instructions for Selecting, Laying and Caring for Hardwood Floors

Cobbs & Mitchell, Inc., and the Mitchell Brothers Company of Cadillac, Mich., have jointly issued a booklet entitled "Modern Hardwood Floors, and How to Get Them." The book is in pamphlet form and gives instructions for selecting, laying, finishing, caring for and re-finishing hardwood floors. The contents tell of the proper under floors and the proper selection of the top layer; also gives instructions as to the condition of the flooring before it is laid, and tells just how to lay the top floor. There

are also paragraphs on the use of fillers and stains which go into the finishing process in detail, telling how to finish with oil, varnish and wax, and giving the advantages and disadvantages of the three methods and of a combination method. Under the section covering the care of hardwood floors, proper methods of caring for floors finished with oil and varnish are given, as also are suggestions as to care of floors finished with wax. Minute instructions as to repairing and re-finishing fine hardwood floors are included in the pamphlet.

The book is well illustrated with cuts showing the different methods of laying floors, giving suggestions as to designs, the proper type of nails to be used, and the right way to lay flooring around objects such as registers, in order to make a workmanlike job. In short, the pamphlet contains all information that would be of practical benefit to the user of hardwood flooring, and is to be had for twenty-five cents from either of the above companies.

Late Glasgow Market Report

The hardwood market of this section is decidedly healthy. The prevailing conditions are now about normal and prospects of a continuation of favorable conditions are encouraging. Imports are still on a meagre scale—comprising spruce deals from Halifax and Portland. These have been easily disposed of without recourse to storing, and unusually high prices have been paid. The quality of some of the parcels of spruce has been so poor that they are unfit for box making. Birch planks have also been imported and no difficulty was experienced in selling them, owing to the bareness of the market. A few contracts for birch planks have been made this week and some difficulty may be found in completing delivery as reports from the other side say that there is likely to be a shortage.

The various Quebec shippers are now due on their annual visit but it is feared that contracting will be no easy matter. With the high f. o. b. prices and present freights the position of merchants is most difficult. Some of the larger merchants have still a quantity of last year's import on hand and no immediate prospect of selling. The advanced freight rates have not yet been felt as regards American hardwoods but this is due to the fact that these rates arranged by yearly contract operate as from Jan. 1, so that shipments after that date and only now due will naturally be much higher. In the case of pitch pine quotations have been lower than for some time and of course this naturally leads one to believe that freights are on the decline. It is quite natural to expect that slight fluctuations will take place from time to time but not to any great extent for some time yet. Many parcels of pitch pine are being transhipped just now from the Continent to the various ports in the East coast and many other parcels in prospect with the result that these markets are kept well supplied. Transshipment freights meantime, however, are difficult to obtain owing to the Board of Trade regulations debarring deckloads.

The S. S. "Kassanga" arrived last week from New Orleans with the usual varied cargo consisting of mahogany, ash and hickory logs and gum, oak and pitch pine lumber. Several parcels of pitch pine logs came in under deck and are reported to have been sold at good figures.

The S. S. "Indrani" and S. S. "Kastalia" have arrived from Newport News and Baltimore respectively with unusually small cargoes of hardwoods, comprised largely of oak planks, chiefly on contract for the railway companies and wagon builders. The quality of the planks is well over the average and there should be very few rejects. Plain oak boards are becoming scarce and higher prices are in command.

At present the docks are in a great state of congestion owing to the carters' strike. Goods cannot be removed from the quay with the result that each succeeding steamer adds to the congestion. Both sides are adhering firmly to the attitudes they have adopted and the chances of an early settlement are still remote. The curtailment of transport facilities is having a serious effect on all trades and many places will require to close down for want of material.

Big Car Order by Pennsylvania Road

Bids have been requested by the Pennsylvania Railroad System for the construction of 12,300 freight cars, at an aggregate cost of about \$16,000,000. Ten thousand of these cars will be additions to present equipment, and the remainder will represent displacements. Of the latter, however, all will be about 40,000 pounds greater in capacity than the cars which they displace. The whole of the new order will represent an increase in total capacity of the road's freight car service of about 546,000 tons.

The cars are distributed over the Pennsylvania System as follows: For the lines east of Pittsburgh: 5,000 steel gondola cars, 1,300 wooden side gondola cars, 1,000 refrigerator cars. For the lines west of Pittsburgh: 3,000 steel gondola cars, 1,000 wooden side gondola cars, 500 refrigerator cars, 500 box cars.

The new orders will be in addition to orders placed during 1912

Publicity for Government's Trust Investigation

The Bureau of Corporations of the Department of Commerce and Labor has issued complete statistics and data covering the findings of the investigation to determine the existence or non-existence of a lumber trust.

According to one part of the report dealing with timber and standing timber, there is a grand total of 2,826,000,000,000 feet in continental United States, including Alaska. Of this 2,196,000,000,000 feet is privately owned. In the Pacific coast region there are 1,013,000,000,000 feet of standing timber, and in the southern pine region 634,000,000,000 feet.

The total estimated footage standing in the National forests is 539,000,000,000 feet, and the total owned by the government, by states and on Indian reservations is 90,000,000,000 feet.

Eleven groups are shown as owning varying amounts of the standing timber of the country. The largest group owned is from 13,000,000,000 to 25,000,000,000 feet, and the smallest less than 60,000,000,000 feet. In the first group are included the Southern Pacific Company, the Northern Pacific Railroad Company, and the Weyerhaeuser Timber Company.

In speaking of the rise in value of standing timber during the last twenty years, the report says that the increase has been nothing less than enormous. For southern pine varying reports have shown an increase in value during the last twenty years as follows: From \$0.12½ to \$4 a thousand; from \$0.10 to \$3 a thousand feet; from \$5 to \$20 an acre; from \$1.50 to \$20 an acre.

The report says that the original Federal grants to the North Pacific and to the present railroads of the Union Pacific—Southern Pacific System—alone amounted to over 90,000,000 acres of land, and of this nearly 69,000,000 acres have already been patented, and that the remainder will ultimately be obtained.

The Weyerhaeuser Timber Company now owns 1,945,000 acres. In Florida 182 holders have 16,990,000 acres of land, of which 4,200,000 acres are owned by only three holders. The holdings of this group of Florida owners have 60,000,000,000 feet of standing timber on it.

Late Liverpool Market

The market position is quite brisk again, with a fairly large volume of trade. Prices, on the other hand, can hardly be described as firm as in the later months. In fact, there has been a distinct tendency toward slump in one or two directions. One might point to hickory as a typical example. Last November buyers were tumbling over one another to buy at 3s, but this week wood was on offer without being purchased at 2s 9d. Present requirements are just being met and buyers have been led to believe by the heavy shipments on consignment that there is a lot of wood on offer, which accounts for the present weak position which is typical of many other items also.

The mahogany sales last week were very well attended and prices were well maintained on the current high level. Sound ash is a very good point. The price asked by brokers for forward delivery is 2s 6d per cubic foot, although it is thought this price has not been paid nor will be paid. However, something about 2s 4d would get orders. Round oak has been rather overdone and shipments are not recommended. The prices of other stocks are much as previously reported and no great change has been noted.

A Publication of Beauty

"Steam Machinery" is the name of a publication of unusual merit, the first issue of which has just come from the Steam Machinery Publishing Company of Duluth, Minn. The purpose of the magazine is revealed by the title.

The first issue is a beautiful exposition of the possibilities of the printer's art. It is printed on high quality paper and gotten up in an unique and effective style, each page of printing being inserted in a panel surrounded by a border of delicate brown tint. An effective design is run on the front cover, and the whole is pleasingly illustrated with catchy sketches.

New Arkansas Hardwood Mill and Oak Flooring Factory

A strictly up-to-date sawmill is now under construction at Pine Bluff, Ark., by the Saline River Hardwood Company, which is allied with the Arkansas Short Leaf Lumber Company, one of the subsidiary concerns of Long-Bell Lumber Company. The mill is being built and the operation will be in charge of Howard W. Coles, formerly manager of the Bliss-Cook Oak Company of Blissville, Ark., and more recently in charge of one of Long-Bell's southern yellow pine mills.

The new hardwood plant at Pine Bluff is intended to be a model one in every respect. The frame is massive and the equipment will be furnished by the Filer & Stowell Company of Milwaukee, Wis.

The Saline River Hardwood Company has hardwood timber holdings of upwards of 30,000 acres, which runs very heavily to forked-leaf white oak, the best type of oak growing in the South, and a considerable percentage of red gum.

As an adjunct to the mill there will be an oak flooring plant, with which line of production Mr. Coles is not only thoroughly familiar, but an expert. Also involved in the details of the operation, the company is putting in a wood steaming cylinder manufactured by The Kratzer Company, Chicago, to secure prompt and accurate drying of its hardwoods, and the oak utilized in the flooring plant will have a subsequent dry-kilning through a battery of kilns that are also being built. This will be the first plant in the country to eliminate entirely the lumber yard per se, as the output will be stuck on trucks at the chains, forwarded to the steaming cylinder and a large portion be advanced onto storage tracks for blowing out in the open, while the remainder of the lumber will go to dry-kilns and from there by means of transfers from the tail-end of the kilns be forwarded some two hundred feet to the flooring factory.

Other hardwood manufacturers are watching with marked interest this distinct evolution and advancement in lumber handling methods. It is thoroughly believable that in low cost and efficiency the new plant Mr. Coles is installing at Pine Bluff will involve the cheapest, most expeditious and satisfactory hardwood operation in the United States.

Timber Purchased by William Whitmer & Sons

A timber area aggregating 15,000 acres in Pennsylvania designated as the "Washington Furnace" tract is reported to have been purchased by William Whitmer & Sons, Inc., of Philadelphia. The transaction was made by the American Estates Association of New York and is the result of negotiations that have been under way for some time.

It is stated that the company will develop the tract by installing a plant and will utilize the water power obtained from a small stream running through its land.

Meeting of St. Louis Club

Many innovations to benefit the Lumbermen's Club of St. Louis were suggested and endorsed by the members at the regular monthly dinner and business meeting of the club, held Feb. 4, at the Mercantile Club. Among them were free information to be furnished through the secretary in regard to traffic matters such as rates, demurrage, switching charges, expense bills, railroad claims, as well as legal advice and notary public services.

The chairmen of the various committees also reported the plans they had mapped out for the coming year.

The speaker of the evening, Eugene Hale, a member of the Municipal Assembly, gave a talk on 'The Municipal Situation, as Viewed from a Legislative Standpoint.'

During the evening W. E. Barns read a forestry bill, which will be presented to the Missouri legislature. The bill has been presented by Mr. Barns to the Southwestern Lumbermen's Association and has been endorsed by it. He offered the following resolution, which was passed:

WHEREAS, Most of the states have given careful and intelligent attention to the conservation of the forest resources by the preparation of authentic inventories of their standing timber, by the acquisition of non-agricultural cut-over lands as a basis for reforestation, by the organization of forestry boards and the employment of trained foresters and the education of public sentiment along conservative lines; and

WHEREAS, The members of the Missouri State Board of Forestry, who have served in this state for eight years past without a cent of expense to the state, now earnestly desire the co-operation of all good citizens in securing the passage of the bill before us at the present session of the Legislature,

RESOLVED, That the Lumbermen's Club of St. Louis heartily endorse this bill and recommend its adoption as a measure that will bring Missouri into line with her sister states and the national forest policy.

By a unanimous vote the bill was referred to the committee of public affairs with authority to act.

The statistical committee of the club will figure up the St. Louis lumber statistics and the data furnished by it will be given out later on and will be distributed broadcast so as to show that St. Louis is the logical lumber center.

Twenty-one new members were elected to membership.

The entertainment committee announced what it intended furnishing in the way of entertainment to the members during the year.

The meeting was one of the most enthusiastic held for some time and from indications the club this year will be one of the most prominent lumbermen's clubs in the country, not only in membership but in the good it will do for the lumber fraternity.

Hardwood News Notes

← MISCELLANEOUS →

The Conneaut Lumber Company has increased its capital from \$10,000 to \$25,000.

The Timber Products Company has been incorporated at Chicago with a capital of \$35,000.

The Derry Lumber Company of Saginaw, Mich., has increased its capital stock to \$25,000.

The Original Cabinet Company has been incorporated at Evanston, Ill., with a capital of \$12,000.

The Blue Ridge Lumber Company, Neola, W. Va., was incorporated at \$217,000 to develop timberlands.

The Arkansas Mill & Lumber Company is incorporated at Little Rock, Ark., with a capital of \$100,000.

The Sicklesteel Lumber Company has been incorporated at Detroit, with a capital stock of \$20,000.

The Nassau Milling Company has been incorporated at Hemstead, N. Y., with a capital of \$50,000.

The Moline Wagon Company of Moline, Ill., has decreased its capital stock from \$1,000,000 to \$600,000.

The Kent Furniture Company of Lenoir, N. C. has changed its name to the National Furniture Company.

The J. H. West Lumber Company of Warren, Pa., has increased its capital stock from \$50,000 to \$100,000.

The Hamilton Ridge Lumber Corporation is a new concern at Richmond, Va., with a capital stock of \$500,000.

The Breece Manufacturing Company, Portsmouth, O., has increased its capital stock from \$100,000 to \$300,000.

The Talbert-Zoller Lumber & Veneer Company of Cincinnati, O., has increased its capital from \$30,000 to \$50,000.

The W. R. Cooper Lumber Company has been organized at Siler City, N. C. The company has a capital stock of \$50,000.

The Globe Bosse World Furniture Company of Evansville, Ind., has increased its capital stock from \$600,000 to \$750,000.

The Harrel Manufacturing Company has been incorporated at High Point, N. C., with an authorized capital stock of \$50,000.

The Burlington Pipe Organ Company of Burlington, Iowa, has changed its name to the Bennett Organ Company of Rock Island, Ill.

The Clearview Manufacturing Company of Wooster, O., has been incorporated with a capital of \$10,000 for the manufacture of screens.

The Stolze Lumber Company has been incorporated at Edwardsville, Ill., with a capital stock of \$30,000, by J. A. E., and E. H. Stolze.

The D. F. Boyer Handle Company is the style of a new incorporation at Danville, Ill. The company has an authorized capital stock of \$50,000.

The Wilkinson-Matthews Lumber Company of Damascus, Va., successor to the Damascus Lumber Company which failed last summer, has filed a voluntary petition in bankruptcy.

The Biggs-Ashford Lumber & Manufacturing Company has been incorporated at Frankfort, Ky., with a capital of \$17,500, by E. R. Biggs, Elbridge Biggs and E. R. Ashford.

The Gates Lumber Company, formerly unincorporated, has taken out papers of incorporation at Green, Iowa. The company will operate under the same name and with a capital stock of \$25,000.

The Georges Lumber Company, Roanoke, Va., was incorporated at \$50,000, and will develop 8,000 acres of timberland in Patrick county. The company has three mills on the tract and will construct a seven-mile railroad.

The Arcola Hardwood Lumber Company of Memphis, Tenn., has filed application for charter. The company will operate with a capital of \$10,000 and is incorporated by C. D. Hendrickson, W. H. Harrelson, George Keub, S. J. George and W. R. Seat.

CHICAGO

W. E. Johns of the Johns-Mowbray-Nelson Company, Cincinnati, O., was in Chicago for several days last week.

C. L. Faust, president of the Faust Brothers Lumber Company, Paducah, Ky., spent two days of last week in the city in conference with his Chicago manager, J. F. Minge.

A. W. Lucas, president of the Lucas Land & Lumber Company, Paducah, Ky., spent Thursday of last week with the local trade.

D. S. Watrous, manager of the plant of the Lansing Company, Parkin, Ark., stopped off in Chicago last week on his way to the company's headquarters at Larsing, Mich.

C. E. Gill and E. C. Dawley of the Gill-Dawley Lumber Company, Wausau, Wis., spent part of last week in this city.

F. D. Timlin, Wausau, Wis., one of the principals of the Wheeler-Timlin Lumber Company of Wausau and Chicago, was in the city for a few days of last week.

J. S. Morris, secretary and superintendent for Bennett Hardwood Lumber Company, Memphis, Tenn., was in Chicago for several days recently.

F. H. Pardoe, timberland factor with offices at Wausau, Wis., recently spent a few days in this city, where he was occupied closing some timber deals.

G. C. Robson of the Parrish Lumber Company, Parrish, Wis., was in the city for several days during the fortnight, having come down from the meeting of the Northern Hemlock and Hardwood Manufacturers' Association at Milwaukee.

J. C. Knox, secretary of the Michigan Hardwood Manufacturers' Association, spent Jan. 2 in Chicago on his return from the Milwaukee meeting of the Wisconsin manufacturers.

Wm. E. Vogelsang of the Turtle Lake Lumber Company, Grand Rapids, Mich., was one of the Michigan lumbermen who passed through Chicago recently on his way to Milwaukee to attend the annual meeting of the Wisconsin lumbermen.

"Phoenix" is the title of a publication issued by the New York Leather Belting Company of New York and Chicago. The paper is devoted to belt engineering, and while it is issued in the interest of the New York Leather Belting Company and the Victor-Balata & Textile Belting Company, it contains a considerable amount of good information. It will be found useful to all users of belts.

The Kellogg Switchboard & Supply Company has been incorporated at Chicago with a capital stock of \$2,000,000.

The January issue of the Pacific Lumber Trade Journal at Portland, Ore., has just been received. This is the annual review number of that publication and is a fine example of progressive trade journalism.

HARDWOOD RECORD acknowledges receipt of a handsome brass desk calendar from the Hadentine Lumber Company, Inc., Camden, N. J. The calendar is in form of a brass easel with the company's name in a black panel, the easel being fitted with two hooks on which are hung a small calendar which can be replaced at the end of the year with a calendar for the next year.

R. G. Maislein, manager of the hardwood department of the Conway Lumber Company, Boston, Mass., was in Chicago a few days recently on his way to and from the meeting of the Northern Hardwood and Hemlock Manufacturers' Association at Milwaukee.

The offices of James D. Lacey & Co., timberland factors of Chicago, Portland and Seattle, have been moved from 1215 Old Colony building, Chicago, to 1750 McCormick building, corner Van Buren street and Michigan Avenue, Chicago.

W. B. Heineman, vice-president and general manager of the B. Heinemann Lumber Company, Wausau, Wis., was in the city for a couple of days the early part of last week.

Phil Attley, manager of the Ross-Attley Lumber Company of Beth, Ark., spent last week and the early part of this week in Chicago.

R. F. Hodges of Milwaukee, Wis., came down to Chicago for a few days the early part of last week.

Frank B. Robertson of the Anderson Tully Company, Memphis, Tenn., was in Chicago on Feb. 7.

Van E. Perrine, the hardwood lumber and dimension stock manufacturer of Fort Wayne, Ind., is in the city in attendance at the automobile show at the Coliseum.

Thomas McFarland of the Thomas McFarland Lumber Company, Cairo, Ill., has been in town visiting the local trade for several days.

W. D. Reeves of the W. D. Reeves Lumber Company, Helena, Ark., was one of the distinguished visitors to the local market last week.

E. Bartholomew of John B. Ransom & Co., Nashville, Tenn., arrived in Chicago on Thursday of last week, coming directly from Cincinnati where he attended the meeting of the Hardwood Manufacturers' Association. Mr. Bartholomew was in the city for several days.

H. W. Baker, Jr., of the Baker-Matthews Manufacturing Company, Sikeston, Mo., was in Chicago the latter part of last week on business in the interest of his company. Mr. Baker came to Chicago by way of Cincinnati, where he attended the meeting of the Hardwood Manufacturers' Association.

NEW YORK

Nearly one hundred witnesses were called to testify in the case of Louis Bossert & Son against the Carpenters' Union in which the plaintiffs seek to have the temporary injunction issued more than a year ago made permanent. The plaintiffs emphasized the point that the combination of Carpenters' Union and other building trades unions in New York to prevent the use of materials of non-union manufacture violated the statute of the state against monopolies. It was established that the Carpenters' Union not only prevented their members from working upon non-union woodwork but they combined with other organized trades connected with building in New York City whereby it was agreed that where non-union carpenters were employed to install materials which the union carpenters were forbidden to install all other trades would quit work. In this way the Carpenters' Union, besides refusing to handle non-union material, prevented the employment of carpenters who could handle open shop material. John Bossert testified that the amount of business his firm did in Manhattan had dwindled from \$525,000 in 1905 to \$35,000 in 1911. The Bossert case is one of the foremost labor cases in the state of New York, if not in the entire country, and is engaging the attention of manufacturers of woodwork all over the country.

The New Jersey Veneer Company has completed its plant at Paterson, N. J. The company will manufacture built-up panels for partitions, office fixtures, counter tops, automobile and carriage specialties in any kind of wood. It will make a specialty of flush veneered doors, fire proof and in-laid panels. The principals of the company are George W. Bailey, F. T. Perrine and R. Moller, all of whom have had long experience in the wood-working trade.

James McBride of the James McBride Company, hardwood flooring specialist of the Bronx, returned from a pleasure trip to the Florida resorts.

Thomas J. Canty has been appointed receiver for the Colonial Column Manufacturing Company of New York, against whom a petition in bankruptcy was filed recently.

T. J. Crombie, one of the best known figures in the lumber trade of the Metropolitan district, died suddenly at his home in this city on Jan. 28. Mr. Crombie began in the lumber business with his father in the firm of Crombie & Silliman. In 1889 the East River Mill & Lumber Company was organized with Mr. Crombie as the active head, many well-known citizens of New York being interested in the company. A few years ago the stock control of the company changed hands, but this did not affect Mr. Crombie's relations with the company and he continued with it and was president at the time of his death. He was a member of the New York Lumber Trade Association, which organization appointed a committee to represent it at the funeral service. He is survived by a widow and one son.

Louis Bossert, the head of the firm of Louis Bossert & Sons, well known throughout the country, died suddenly on board the steamship Cleveland en route from Honolulu to San Francisco. Mr. Bossert was on a trip around the world and was accompanied by his wife and youngest daughter. The news was a severe shock to his many friends and associates in the lumber trade.

BUFFALO

The announcement of the new committees of the Chamber of Commerce was made on Jan. 31 and the list includes many of the lumbermen, showing that the members of the trade will take an active part in the affairs of that body during the coming year.

The project of building another railroad across New York state, to be

known as the Buffalo, Rochester & Eastern, has again been brought forward, and one of those interested in the plan is J. N. Scatcherd. When it was brought up before it was vetoed by the Public Service Commission, which declared it unnecessary, but many shippers of fruit and other merchandise say they are unable to get cars enough at some seasons from the New York Central and that a new road is much needed.

B. F. Ridley of Davenport & Ridley recently returned from a business trip of several weeks in the South, where he bought stocks of oak, chestnut and poplar for the Buffalo yard.

Blakeslee, Perrin & Darling state that the hardwood demand is very good for this season and that all sorts of stock have been moving freely during the past few months.

H. A. Stewart returned early this month from a business trip to West Virginia. The yard of I. N. Stewart & Bro. is moving considerable plain oak, which is bringing quite an advance over a few months ago.

T. H. Wall was in attendance at the retail lumber convention at Utica late last month. M. M. Wall is now at Mt. Clemens, Mich., where he will take a brief rest away from the lumber business.

Anthony Miller reports the hardwood business as picking up some, after a rather quiet start early in the month. His yard is receiving good stocks in a number of different hardwoods.

A. W. Krienheder is contemplating a trip South in the near future to look after the large oak and chestnut shipments which are coming into the Buffalo yard of the Standard Hardwood Lumber Company.

W. K. Jackson of Jackson & Tindle, has returned from a business trip to the Michigan mills of the firm. He reported a great lack of snow for logging in some parts of that state.

The yard of T. Sullivan & Co. is getting in a good assortment of maple in two to three-inch thickness and also quite a quantity of brown ash. Prices are reported upward bound.

Hugh McLean has returned from an eastern business trip. The office states that the demand for oak continues active, especially in plain, while quartered is also showing better sales.

PHILADELPHIA

Frederick S. Underhill of Wistar, Underhill & Nixon, reports accelerated trading, with all signs propitious for a prosperous new year.

The Abbott-Carnell Company, 259 and 261 Enlitt building, composed of John F. Abbott and Thomas L. Carnell, is practically a new concern. Operating in the West Indies, Central and South America, it handles veneer and fancy hardwoods, among which it lists mahogany, ebony, Spanish cedar, lignum-vita, mahoe, greenheart and bullet. Mr. Abbott reports the mahogany business very active at this time. The company cuts the stuff and furnishes it to the wholesalers.

E. S. Nail, president and manager of the Lumbermen's Mutual Insurance Company, Mansfield, O.; W. S. Parker, Finley, O.; and J. W. Frankeberger, Mansfield, O., directors of the company, were guests of the Pennsylvania Lumbermen's Mutual Fire Insurance Company, at their annual meeting Jan. 28. Justin Peters, the popular manager of the Pennsylvania concern, attended the nineteenth annual meeting of the Retail Lumber Dealers' Association of New York, which was held in Utica, N. Y., on Jan. 29 and 30. On this occasion the Pennsylvania Lumbermen's Mutual Fire Insurance Company and its affiliating mutual companies donated a handsome souvenir booklet containing men, etc.

The J. W. Turnbull Lumber Company has moved to its new offices, 807 and 808 New Stock Exchange building, where it will have better facilities for handling enlarged business.

The Lance Lumber Company, West Reading, was adjudged an involuntary bankrupt Jan. 31. Referee, Samuel E. Bertolet.

The American Chair Company, Trenton, N. J., was incorporated under New Jersey laws Jan. 24, with a capital stock of \$5,000.

The Leraysville Furniture and Toy Company, Leraysville, Pa., obtained a charter under Pennsylvania laws Jan. 28; capital, \$15,000.

J. N. Holloway of the Imperial Lumber Company reports steady trading, with every indication of a big year for the lumberman.

Rayner & Parker, composed of R. B. Rayner and H. G. Parker, are the successors to R. B. Rayner & Co.

PITTSBURGH

A number of traffic men of the Pittsburgh Wholesale Lumber Dealers' Association attended the annual banquet of the Traffic Club of Pittsburgh at the Hotel Schenley, Jan. 30, where they were highly entertained. Arthur Brisbane, the New York editor, was the first speaker of the evening and argued that railroads are in a position to do very much more for their clients and for the people in general than they have been permitted to do and that the prosperity of the railroads has much to do with the prosperity of the nation.

The Pittsburgh Industrial Development Commission has landed two more plants for this city, both of which will use considerable hardwood in building and manufacturing operations. One is the Hanlou-Gregory Galvanizing Company, which will build a big plant at Twenty-fourth street and the A. V. R. R. The other is the National Tag & Manufacturing Company, which will locate at Parnassus, a suburb of this city.

The Mead & Speer Company, one of the well-known hardwood concerns of this city, is closing out its business at 6048 Jenkins Arcade. It closed

up its lumbering operations at Strange Creek, W. Va., some time ago and is tearing up its railroad there now.

The Warren Table Works at Warren, Pa., will build a three-story addition to their plant this spring to take care of the rapidly increasing business.

The Crescent Lumber Company is doing a nice business in poles, piles and ties. It finds difficulty in getting stock promptly to supply its trade.

The Morland-Ricks-McCreight Company is enlarging its business and has added to its force of salesmen Alexander Gordon, who was for eleven years in the employ of the Babcock companies in this city.

The Commercial Lumber Company, Youngstown, O., has just received its charter with a capital of \$40,000. The members are M. Lee Gailey, John I. Gailey, William Orr, J. Dale Gailey and A. C. Cook.

Joseph J. Linehan has moved his office to 816 Fulton building where he is handling the stocks of the Mowbray & Robinson Company and finds little difficulty in bringing in a good trade.

The Duquesne Lumber Company is making splendid headway with its mammoth operation at Braemer, Tenn. G. C. Adams, sales manager of this city, has been in the East the past few days and finds a good strong market there.

BOSTON

The Massachusetts Wholesale Lumber Association held its annual meeting and banquet at the Exchange Club, Boston, Jan. 29. Several matters of importance were discussed, among them the several bills before the Massachusetts legislature this year which directly affect the lumber industry. The Massachusetts Wholesale Lumber Association and the Lumber Trade Club of Boston have joined together to fight these bills before the committees and to carry the fight further if necessary.

It was also voted to join with the Lumber Trade Club in having a ladies' night later in the season.

The officers elected were as follows: President, William E. Litchfield; vice-president, Charles S. Wentworth; secretary and treasurer, E. C. Hammond; assistant secretary and treasurer, A. W. Moore; executive committee, Harry B. Clark, chairman, H. W. Blanchard, Morris A. Hall, Frank W. Page, H. B. Stebbins, E. O. Lake, Frank P. Huckins, H. B. Piske, T. A. Shepard and Martin A. Brown.

The Woodstock Lumber Company of Boston has purchased additional timberlands in Canada from the Missisquoi Lumber Company.

William E. Litchfield, the well-known hardwood lumber manufacturer and dealer, Boston, was appointed delegate from the Boston Chamber of Commerce to the National Chamber of Commerce at Washington.

BALTIMORE

The Baltimoreans who attended the annual meeting of the National Lumber Exporters' Association at Chattanooga Jan. 23 and 24 report that the annual was the most largely attended in the history of the organization and that the interest shown in the proceedings is a gratifying indication of the growing influence of the organization. The renewal of the contract with Frank Tiffany, the foreign representative, with headquarters in London, is regarded as among the most important matters disposed of. Mr. Tiffany's work has been eminently satisfactory and he is held to have met every expectation entertained. Through his efforts better relations have been established with the foreign brokers and buyers than ever before existed, while at the same time his tact and energy have saved the shippers considerable money. One result of the better understanding has been the prompt settlement of cases involving claims on the ground that lumber shipped did not come up to grade.

A certificate of an increase in the capital stock of the Maryland Land and Lumber Company has been filed for record at Dover, Del., where the company was incorporated on Nov. 12, 1912, with a capital stock of \$100,000. The increase is to \$3,000,000. The incorporators are H. Ralph Ewart, Clarence J. Jacobs, and Harry W. Davis, all of Wilmington, Del. The office of the company is in the Delaware Trust Building at Wilmington. Richard L. Tilghman is president of the company, and H. Webster Smith is secretary.

David T. Carter & Co., hardwood wholesalers and exporters, are experiencing such an increase in their business that they have found it necessary to get larger offices. They have moved from the tenth to the ninth floor of the Calvert building, Fayette and St. Paul streets.

David Sterritt McNitt, a director of the Maryland Lumber Company, which has its headquarters at Hagerstown, Md., and operates a sawmill at Denmar, W. Va., died in a hospital at Lewistown, Pa., last week of injuries received when he was struck with the broken end of a steel cable and hurled to a ledge of rock.

Mr. Howie of Wright, Graham & Co., of Glasgow, Scotland, who has been making a trip of the lumbering sections of the eastern states during the last month or so, stopped here on his way back to New York last week, preparatory to taking the steamer for home. He complained that the price of hardwoods had been advanced to such figures as to check the export movement and compel the foreign yards to hold back and supply only their most imperative necessities.

Herman D. Billmeyer of the Billmeyer Lumber Company, of Cumberland, Md., which makes a specialty of bridge and ship timbers, is a candidate for the postmastership of that town. President Taft recently appointed a successor to Postmaster Pearre, but the Senate Democrats, in

accordance with the plan adopted by them, are holding up the appointment, together with a number of others, intent on Wilson filling any vacancies that may arise between now and March 4. Mr. Billmeyer is a very successful business man and has excellent backing.

James Baer of Richard P. Baer & Co., Maryland Casualty building tower, recently returned from a business trip to northern New York and Canada. He states that he found business everywhere in excellent shape, the yards taking stocks with much freedom, and prices remaining not only firm, but showing a tendency to advance. Oak in particular proved to be in strong demand, with the buyers ready to pay any reasonable figure to get suitable supplies.

The R. E. Wood Lumber Company is making rapid progress with its new mill in Swain county, North Carolina, which is to take the place of the plant on Eagle Creek, operated for some years. It is expected that the mill will be in operation in about ten days or two weeks.

◀ CINCINNATI ▶

The Thompson Hardwood Lumber Company reports business much improved over a couple of weeks ago. Roy Thompson states that prices are very firm, and on some of the upper grades he expects an advance before July, while the lower grades are strong.

Fred Mowbray of the Mowbray & Robinson Company says that business is very good. All of the company's mills are running to capacity. Mr. Mowbray thinks that prices will not be any lower, and advises buyers to buy now.

At the big hardwood plant of the M. B. Farrin Lumber Company, Sales Manager Sterrett said that while prices on worked stock are not high enough in comparison with the cost of rough material, there is no complaint to make now. He predicts a general stiffening up in all items such as this mill produces. Flooring is in good demand at satisfactory prices and the lumber end of the business is more than satisfactory.

The Kosse, Shoe & Schleyer Company, exporter of hardwoods and specialist in black walnut, says there is every reason to look forward to a very satisfactory market condition during this year, both in this country and abroad. It is well supplied with orders at present and expects much increased demand as the season grows. Prices obtained are very satisfactory.

Cliff S. Walker, president of the Bayou Land and Lumber Company, has been confined to his home for the past several weeks. For some time Mr. Walker has not been in good health and his badly rundown condition, without the rest that he should have taken long ago, has resulted in a general break-down that has taken some time to mend. His many friends are rejoicing in the good news that he is gradually recovering his strength and that by the time good weather comes along "Cliff," as he is affectionately called, will be out again. He is contemplating a long rest and will likely take a long trip just as soon as he is able to get out.

◀ COLUMBUS ▶

The mild weather which prevailed during the month of January favored active building operations, as is shown by the report of the city building inspector. During the month the number of building permits issued was 105 as compared to 66 for January of a year ago. The valuation of the buildings projected was \$208,335 as compared with \$99,930 in January of last year.

A state chamber of commerce is to be organized for concentration of public opinion upon questions affecting the financial, commercial, civic and industrial interests of the state. A committee appointed has drawn up by-laws of the proposed organization and sent them to interested parties in the state. The committee consists of J. E. Todd, president of the Columbus Chamber of Commerce; S. P. Bush, president of the Ohio Manufacturers' Association of Columbus; W. C. Culkins, secretary of the Cincinnati Chamber of Commerce; H. S. Grimes, president of the Portsmouth Chamber of Commerce, and U. S. Stevens, secretary of the Akron Chamber of Commerce. Columbus will be the headquarters of the new organization.

The Commercial Lumber Company of Youngstown, O., has been incorporated with a capital stock of \$40,000 to deal in timber and timberlands. The incorporators are M. Lee Gailey, John L. Gailey, William Orr, J. Dale Gailey and A. C. Cook.

The Brott & Ford Company of Willoughby, O., has been incorporated with a capital stock of \$25,000 to deal in lumber and operate a lumber yard. The incorporators are A. H. Ford, Elmer E. Brott, H. C. Boyd, A. H. Condon and George W. Shaw.

Marion Menefee, 274 South Ohio avenue, who is connected with the lumber firm of Cones & Menefee, 450 West Broad street, died recently as the result of an automobile accident.

R. W. Horton, sales manager for the central division of the W. M. Ritter Lumber Company, says trade is very good in every line of hardwood. The yard people are probably the best buyers at this time. Retailers are trying to stock up preparatory to the spring rush. Factory trade is also good and manufacturing concerns are buying liberally. Implement and vehicle dealers are in the market and there is also a good demand for car stocks. Furniture people are expected to buy after the furniture shows are over.

W. L. Whitacre of the W. L. Whitacre Lumber Company, recently returned from a buying trip in the South.

John R. Gobey of John R. Gobey & Co., says the demand for hardwoods is very good and that prices are ruling firm. Stocks are scarce and there is no accumulation of any great variety. Mr. Gobey recently returned from a southern trip where he purchased for his concern.

A delegation of Columbus lumbermen consisting of John R. Gobey, M. A. Hayward, W. B. Sisson, J. W. Mayhew and others attended the annual meeting of the Hardwood Manufacturers' Association of the United States at Cincinnati recently.

Manager Hodil of the Virginia Lumber Company reports a good demand for hardwoods, especially in the lower grades. Prices are holding up firm and shipments are going out well.

J. A. Ford of the Imperial Lumber Company reports a good demand with prices strong. He fears the heavy fall of snow will delay shipments.

F. Everson Powell of the Powell Lumber Company says the volume of business is very good and the factory demand is probably the best. Yards are buying only for immediate uses.

An important change took place in the hardwood field in central Ohio when the firm of M. A. Hayward & Son moved its headquarters from Columbus to Detroit. M. A. Hayward, head of the concern, will have charge of the Detroit office, which is located in the Palmer building. H. M. Hayward will retain the office in this section. The concern is one of the heaviest hardwood shippers in central Ohio.

W. B. Sisson, sales manager for the Sowers-Leach Lumber Company has returned from a trip in the South where he made extensive purchases. He says the trade is good for this time of the year and prospects for the future are bright.

◀ TOLEDO ▶

The Toledo Carriage Woodworking Company reports business better than it has been for three years past. The factory is running at full capacity and full time.

A meeting of the stockholders of the Booth Column Company was held Jan. 27, at which time directors for the ensuing year were selected. The old board of directors was selected with the exception of David Trotter, who resigned, his place being taken by R. A. Lauders. Officers were elected as follows: President, W. S. Booth; vice-president, E. W. Crumbach; secretary, J. H. Ellis; treasurer, Wm. T. Hubbard. The stockholders will hold a meeting in the near future to define the policy of the concern for the coming year.

The Gotsball Manufacturing Company reports many inquiries and a big call for bending stock. The material is rather scarce and prices are high and dry hickory stock is extremely hard to get. The concern will begin rebuilding its factory in the early spring as soon as the weather will allow.

Spontaneous combustion was the cause of a recent fire in the planing mill at the Big Four Hardwood Company on Avondale avenue. The fire originated in a coal bin but was put out by firemen before much damage was done.

The Toledo Turning Works, manufacturing porch columns, reports business a little dull, as is natural at this season of the year. The outlook is reported extremely promising and a large spring business is looked for. The factory is now running nine hours a day with two-thirds of its force.

◀ INDIANAPOLIS ▶

Robert Heun of Richmond has gone to Japan to engage in the hardwood lumber trade.

Building permits issued by the building inspection department last month amounted to \$305,385, establishing a new record for the month of January. Permits issued in January, 1912, amounted to \$142,955.

Refrigerators will be manufactured by the Acme Refrigerating Company, organized and incorporated with a capital of \$10,000 at Hammond, by William Wolter, C. D. Lewis and Adolph Bossa.

John Oxenford, for twenty-five years engaged in the wholesale lumber business, died here Jan. 27 after an illness dating from last October. He was born in Yorkshire, England, and was sixty-six years old. Burial was in Crown Hill cemetery.

With an authorized capitalization of \$30,000, the Shelbyville Desk Company has been organized and incorporated at Shelbyville to manufacture a line of desks. Those interested in the company are W. J. Kamhre, E. A. Swain and E. F. Kamhre.

The Atkins Pioneers, composed of persons who have been employed by E. C. Atkins & Co. for twenty years or more, held their annual meeting and banquet at the Spencer House on the evening of Feb. 1. The oldest member is John H. Wilde, employed by the company forty-eight years. Officers were elected as follows: President, Ernest Velwegh; vice-president, Charles Bronson; secretary, Charles Newport, and treasurer, Charles Annmann.

◀ MEMPHIS ▶

The crest of the rise in the Mississippi river has already reached Memphis and, while the river is stationary at the moment, it is expected that the water will begin to fall within the next day or two. The highest point reached was 40.5 feet. This is within between four and five feet

of the high water mark established here last spring. The water is still rising from Memphis south and indications are that there will be a pretty high stage recorded at Helena, Greeneville and other points between here and New Orleans.

So far as Memphis proper is concerned, the high water has done comparatively little damage. A few plants on Wolf river have found it impossible to operate during the past few days but they expect to resume very shortly. In South Memphis there has been very little if any inconvenience occasioned by the high water. The levee surrounding the yard of May Brothers, which gave way last year, has held intact and that company has been able to continue in steady operation. The Memphis Saw Mill Company and other firms, which found it impossible to operate last year for quite a while, have likewise escaped injury. The track leading from the telepher docks to the plants in New South Memphis has not been covered by water as was the case last year, and the movement of timber has not therefore been seriously interfered with. Altogether the lumbermen of Memphis are congratulating themselves upon the fact that the high water has come without bringing any more inconvenience or loss.

Some of the lumber firms of Memphis owning and operating plants outside of this city have not been so fortunate. The plant of the N. Butler Haynes Company, at Beulah, Miss., has been put out of commission for the present, and this firm has also a great deal of timber which is under water. Lee Wilson & Co., operating a plant in that locality, have also found it impossible to run recently. One of the mills at Stoneville, Miss., the output of which is taken up by the Grehe-Sine-Lumber Company, is also unable to operate. These conditions have resulted from the failure of the government engineers to repair the break in the levee system of Beulah, which occurred last spring. This is now about 400 feet wide and a vast area is covered with from four to six feet of water. The Riverside division of the Yazoo & Mississippi Valley Railroad Company has been put out of commission and this has materially interfered with the movement of timber from that territory.

Lumber interests on the Arkansas side of the Mississippi river have suffered little if any inconvenience from the high water. The levees at Modoc, Wyanoke and other points where breaks occurred last year were repaired in plenty of time and there has not been any giving away of the levee system at any point on the western side of that stream. George C. Brown & Co., who were seriously interfered with last year, have been able to operate steadily at Proctor and the plant of Lee Wilson & Co., at Wilson, has escaped even the necessity of suspension. Last year there was scarcely a plant in eastern Arkansas near the river able to operate for quite a while as a result of breaks in the levee system and the consequent flooding of a vast territory in that state.

The movement of timber to Memphis over the western lines has not been interfered with. Owing to the fact that the levees in Arkansas have remained intact, the tracks of all the western lines have remained above water and there has been a constant handling of business both into and out of the West. The only interference with the lines east of the Mississippi river has been in the case of the Riverside division of the Yazoo & Mississippi Valley road, to which reference has already been made.

Although through service is being maintained on the Yazoo & Mississippi Valley main line it may be noted that this road is short of equipment and that the loading of logs for Memphis and other points thereon has not been anything like it might be. In fact the Valley Log Loading Company says that it was impossible for it to do any work for more than a week, as a result of the lack of motive power and as a result of the presence of so many loaded cars on the sidings below this city. The company, however, a few days ago resumed loading and it is expected that there will be pretty full receipts of timber over that line at Memphis.

The heavy rains which have occurred throughout this territory since the first of the year have interfered to a considerable extent with logging work and the outlook for an adequate timber supply is not flattering at the moment. Lizards are being used freely in the low lands but it is impossible to make headway with teams. However, conditions from a logging standpoint are far superior to what they were following the high water of last year and lumbermen here are hopeful that it will be possible to secure a sufficient supply of timber to enable them to take care of their more urgent needs.

The Dugger & Goshorn Company of this city has purchased 3,140 acres of timberland south of Humphrey, Ark. This tract adjoins the other holdings of this firm and brings the total to about 6,500 acres. This company operates a plant at Memphis for the manufacture of hardwood lumber, plow handles and dimension stock. It has been engaged for some time in the erection of a seven-foot band mill at Warren, Ark., and this is about complete and ready for operation. It is estimated that the firm has enough timber to last five or six years.

The Southern Boiler & Tank Works is beginning to erect a plant at the intersection of the Union Railway Company (Belt Line) and Wolf river. This is to be one of the most complete of its kind in the South. This company is owned by C. L. Ford and C. S. Stanton. It was organized several years ago and has been remarkably successful. It will be possible for the company to do several times as much business under the new regime as heretofore.

E. W. Cowgill, who recently resigned his position as assistant to the president of the Illinois Central Railroad Company, has gone to Clarksdale, Miss., to take charge of the United States Lumber & Cotton Com-

pany, which maintains offices at that point. This company has extensive holdings of timberlands in the Mississippi valley and it proposes to establish sawmills and take other steps for the development of the timber thereon. This is to be done with a view to clearing the land and placing it in readiness for cultivation. When all of the land has been cleared and placed in cultivation the company will have approximately 33,000 acres for cotton culture.

Among the recent visitors to Memphis has been L. P. Arthur, formerly of the Arthur Hardwood Flooring Company. He left Memphis some years ago and is interested in the Payson-Smith Lumber Company. The general offices of this firm are at Minneapolis, but Mr. Arthur has his headquarters at Chicago. The present Memphis Hardwood Flooring Company is successor to the Arthur Hardwood Flooring Company, in which Mr. Arthur was one of the moving spirits. He brings cheerful news to Memphis regarding conditions obtaining in the hardwood lumber industry. Mr. Arthur was accompanied to Memphis by T. E. Youngblood, manager of the St. Louis offices of the same firm.

Judge J. E. McCall, of the federal court for the western district of Tennessee, has sustained the plea in abatement entered by Casey Todd, for the Mississippi River Commission, in the suit brought by M. S. Cubbins, representing the Riparian Land Owners' Association, against the commission and sixteen levee boards in the Mississippi valley. This ends the action which was brought by Mr. Cubbins and associates for the purpose of restraining the commission and the various levee boards from maintaining levees on either side of the Mississippi river between Cairo and the Gulf. The decision of Judge McCall is a source of much satisfaction to lumber interests and others who have extensive holdings in the Mississippi valley which are protected by the embankments against which the suits are aimed.

< BRISTOL >

At a meeting of the creditors of the J. A. Wilkinson Lumber Company, Inc., held recently, Trustee Irving Whaley was instructed to offer for sale at public auction, on March 8, the Wilkinson mill and yard site in this city. The property cost about \$70,000.

The president of the company, J. A. Wilkinson, was examined at length. G. E. Goodell, secretary-treasurer, was also on the stand. It was developed that after the failure of Charles R. Partridge & Co. at Jersey City, N. J., in May, 1912, the Wilkinson company made a contract with J. M. Myers of Philadelphia and E. H. Cohic of Jersey City, whereby they were to float an amount of paper of the Wilkinson company, not to exceed \$200,000, the company to advance to the men \$15,000 of its paper and on future sales to receive sixty per cent and Myers and Cohic forty per cent. It was claimed that their net commission was to be but ten per cent and that they were to assume payment of forty per cent of the paper at maturity. However, it was shown that little is known of Myers and that he cannot now be located. Little is known of Cohic except that he was formerly with the Partridge company, the failure of which caused the failure of the Wilkinson company. Cohic wrote attorneys here, who wrote him for information, that he would furnish it if a check for \$125 were sent him. An attorney was sent there and his deposition taken without giving him anything. On the stand J. A. Wilkinson told of the contract with Myers and Cohic and said that the company never received anything on a considerable amount of the paper given to Myers and Cohic, but this paper, together with that upon which the company realized sixty per cent of the proceeds, is now all here for collection, being held by innocent purchasers. The creditors are endeavoring to hold the directors personally liable because the company paid a dividend after the Partridge loss.

William S. Whiting of the Whiting Manufacturing Company was here this week from Asheville, N. C. He says that the company is hopeful of financing its big timber proposition at an early date, so that operations can be resumed. The company owns a boundary of 125,000 acres of virgin forest in Graham county, North Carolina, but must raise \$1,000,000 more to build a railroad from Fontana to Robbinsville and railroads from Robbinsville through the timber, in order to get it out. He believes that the company will resume before long. Frank R. Whiting of Philadelphia is looking after the financing of the proposition.

The Georges Lumber Company of Roanoke, Va., has just been organized for the purpose of developing a large area of timber land in Patrick county, Virginia. A band mill will be installed and a small railroad built.

The Tri-State Lumber Company of Uniontown, Pa., is preparing for extensive development of timberlands in southern West Virginia, near the Virginia border. A railroad will be built and several mills installed at an early date.

< LOUISVILLE >

Friends of Charles H. Stotz are sympathizing with him on account of the poor state of his health. Tuberculosis has developed, and Mr. Stotz is planning to go to Germany to take the much-heralded Friedmann cure. Mr. Stotz recently filed a petition in bankruptcy for the Falls City Lumber Company, the name under which he had been doing business, but declares that if he gets well he will surely get on his feet in the business world again.

The Louisville Hardwood Club attended the annual convention of the

Hardwood Manufacturers' Association of the United States in Cincinnati almost en masse, passing up its own regular weekly meeting in order to attend. This action was largely the result of a cordial telegram of invitation wired to the organization by Lewis Doster, secretary of the association. The Hardwood Club will go to Nashville Feb. 18, to be the guest of the Lumbermen's Club of that city. A special car has been engaged for the trip. This will be the first time the two clubs have ever foregathered, and the trip is expected to be a most enjoyable one. The club will also be officially represented at the annual meeting of the National Wholesale Lumber Dealers' Association, to be held in Atlantic City March 6 and 7, the association having asked that three members be named to be the special guests of the organization at its banquet. President Edward L. Davis will name the three representatives in the near future.

Railroad men representing the roads interested conferred in Louisville recently regarding the advance in rates on lumber from the South into Canada, which is the subject of a complaint now before the Interstate Commerce Commission. The two subjects taken up were the division of rates which should be in effect and the proper defense to make against the arguments of the shippers. There is a bare possibility that as a result of the meeting the advance will be withdrawn.

The 1913 flood is now a matter of history, as far as Louisville is concerned, and "the Point," the district chiefly affected, is now in a normal condition, both as to its residents and the industrial concerns located there. Their yards have been placed on terra firma again; losses, which turned out to be remarkably small, have been charged up, and business is running along about as usual. The Louisville Point Lumber Company's sawmill is now in condition to run, and as it was the first affected by the rise, this indicates the passing of the last vestiges of the flood.

In all probability, according to advices from Washington, the bill of Congressman Stanley, which was intended to force the Louisville & Nashville to grant interchangeable switching to local shippers, will not be acted upon at this session. The delay in getting legislation on the subject will not affect the fight of the Board of Trade in behalf of lumbermen and other shippers who have been imposed upon by the arbitrary rules of this company on the subject of switching. The Board will proceed to lay a complaint before the Interstate Commerce Commission in the near future, believing that the present statutes give the commission ample authority with which to deal with the matter.

The Salt Lick, Ky., Lumber Company, which recently sued the American Boom & Timber Company, the Wheeler-Holden Tie Company and the Whistler & Searcy Company to enjoin these concerns from interfering with the movement of rafts of the plaintiff, settled its differences with the defendants without the necessity of having the case heard. The trouble arose over the use of the Licking River, the Salt Lick company contending that the American Boom & Timber Company and the others had arranged their booms so that it was impossible for it to float its logs out.

J. W. Johnson & Co., Jackson, Ky., have purchased 30,000 acres of timberland on Line Fork of the Kentucky river, and are building a twenty-mile railroad to the extension of the Lexington & Eastern, the purpose of which is to enable them to develop the property. A large mill will be built, as well as other buildings needed in the operation, which will be one of the largest in eastern Kentucky.

The handle factory of H. R. Lemay at White Cloud, near Corydon, Ind., was recently burned with \$4,000 loss. The plant probably will be rebuilt.

The Turner, Day & Woolworth Handle Company of Louisville, one of the largest hickory handle manufacturers in the world, has declared a semi-annual dividend of four per cent, payable Feb. 1.

Carr Brothers of Nashville have purchased a big tract of timber in Bell county from the Continental Coal Corporation of Pineville, Ky., and will erect a large mill near Pineville.

◀ ST. LOUIS ▶

The estimated cost of new buildings and alterations for which permits were issued during January fell \$2,801,163 short of the mark for the corresponding month last year, according to the report of the building commissioner. The total estimated cost in permits issued during January last year was \$3,408,032. The total last month was \$618,869. The permit for the Railway Exchange building for \$2,600,000 was taken out last January.

Both shipments and receipts of lumber showed increases during last month. The receipts in January, 1913, were 16,137 cars, compared with 10,476 cars during the month of January last year, an increase of 5,661 cars. The shipments last month were 10,339 cars, while during the month of January, 1912, they were 7,584, or an increase in January this year of 2,755 cars. There were no shipments or receipts during January last year nor this year.

The hearing in the matter of the investigation and suspension of advances in rates of hardwood lumber from points in Arkansas, Louisiana and other points to Memphis, St. Louis and other points of destination, which was set for Feb. 10, in this city, has been postponed until March 10. It will be before Special Examiner Elder. Harold Small, who will have charge of the legal end for the Lumbermen's Exchange, says that hardwood lumbermen from Omaha, Neb., Cairo, Ill., Memphis, Tenn., and possibly Chicago, will appear before the examiner and oppose any advances.

Frank G. Hanley, wholesaler of cypress lumber, left for New Orleans and Cuba last week. He will spend a few days in New Orleans on business and then go to Cuba for two or three weeks of pleasure and business combined.

E. W. Blumer, sales manager for the Lothman Cypress Company, who has recently returned from a visit to the Oshkosh plant and a trip through the North, states that he brought in some good-sized orders and found conditions very good everywhere he visited. The lumbermen are feeling fine, stocks are very low and he anticipates a big trade from that section as soon as the weather opens up.

E. H. Luehrmann of the C. F. Luehrmann Hardwood Lumber Company reports conditions good and that lots of orders are being shipped out all the time. The demand for everything on the list is strong. Gum, yellow pine and oak are most in demand and orders have come in so well recently that the company's stocks are running low, as it is not getting in enough dry stock to meet the demand.

L. M. Burgess of the Steele & Hibbard Lumber Company is trailing around up in Iowa and Minnesota, getting orders. He has already sent in some good-sized ones.

Leopold Methudy, a wealthy retired lumberman, seventy-six years old, died last week. For more than two years he has been in poor health. He was a captain in the Union Army, stationed at Fort Pickering, Memphis, Tenn. He moved to St. Louis shortly before the war and engaged in the lumber business. He was a member of Ransom Post of the G. A. R. of St. Louis and a member of the Loyal Legion. He is survived by his wife, three sons, two daughters and two grandchildren.

The Lumbermen's Exchange held its first monthly dinner and meeting under the present administration on Feb. 7, at the Mercantile Club. The standing committees made reports on what they have done and what they intend to do. President F. H. Smith advocates holding monthly meetings in order to bring the members in closer touch with each other and to make them take greater interest in the affairs of the Exchange. Only the members of the exchange are expected to participate in these monthly meetings.

◀ MILWAUKEE ▶

The Steinman Lumber Company of this city has filed an amendment to its articles of incorporation at Madison increasing the capital stock from \$100,000 to \$200,000.

Louis Hanitch, C. J. Hartley and L. J. Hunt are named as the incorporators of the Belden Timber Company of Superior. The concern has been incorporated with a capital stock of \$25,000.

The Interstate Commerce Commission has authorized railroad rates on lumber as follows: The Milwaukee road is authorized to continue to charge on lumber in carloads between Eau Claire, Chippewa Falls or Menominee, Wis.; Duluth, Cloquet, Minn.; Superior, Wis., and points taking the same rates as are concurrently in effect on like traffic between the same points by way of short line and to maintain higher rates from and to intermediate points, provided their present rates from and to said intermediate points are not exceeded.

Due to the better demand and prices that prevailed for timber last year, the logging operations in northern Wisconsin and Michigan are heavier than for the past five years. Weather for logging is very good for the large operator, but the small jobbers are looking for a fall of snow. Millions of feet of timber have been cut but are in many cases lying on skids in the woods awaiting the coming of snow so that they may be hauled to market or sidings. The lack of snow means less logs on the market and an advanced price of lumber. The large operators, with their modern hauling devices, are hauling much timber.

The Kenfield-Lamoreaux Company of Washburn has started both day and night shifts and expects to continue the same throughout the winter. The mill furnished stock for the large box and crating factory of the company in Washburn, which is also running full blast.

The Diamond Lumber Company of Green Bay cut over 24,000,000 feet of lumber during 1912, according to the report of General Manager J. T. Phillips at the annual meeting of the company. With favorable labor conditions next year the cut for 1913 will reach 30,000,000 feet. The company's mill is running day and night shifts now. John Tolfree of West Branch, Mich., was elected president; M. P. Gale of Saginaw, vice-president; A. W. Seeley of Saginaw, secretary; J. T. Phillips, Green Bay, treasurer and general manager.

W. T. Bradford, bond officer of the Union Trust Company of Menominee, has returned from Manistique where the reorganization of the Consolidated Lumber Company was completed. The consolidated company has taken over the properties of the Chicago Lumber Company of Michigan, the Western Lumber Company and J. D. Wilson & Co. of Manistique. The company is capitalized for \$1,475,000 and has a serial bond issue of \$350,000. I. C. Harmon, manufacturer of Menominee, was elected president of the company and will move to Manistique to assume duties.

The Merrill Veneer Company determined to make a general expansion of the capacity of its plant at the annual meeting at which officers were also elected.

Ralph Story of Milwaukee, has acquired an active interest in the Badger Basket & Veneer Company at Burlington, and has assumed the position of secretary and treasurer.

George Hays, a well-known box manufacturer and an old resident of Milwaukee, died on Jan. 27 at the home of his daughter after a short

Illness. He engaged in the planing mill and box manufacturing business on Fifth and Cedar streets many years ago. Some time ago Mr. Hays retired and his sons took over the management. Mr. Hays was eighty years old, and is said to have been the oldest living Mason in Milwaukee. Two sons and three daughters survive him.

◀ DETROIT ▶

Secretary John Lodge of the Dwight Lumber Company reports that his factory is very busy and that the demand for hardwood flooring is constantly increasing. During the past thirty days prices on flooring have increased an average of \$2 a thousand, due to the increase in price of rough material. At the present time Mr. Lodge says that the lumber supply is ample but that he fears that the company will have some difficulty in getting rough stock before very long.

George I. McClure says that business is rushing and that the hardwood sales of the past month are far in excess of any January in the business to the best of his recollection. Owing to the scarcity of snow in Michigan he is afraid that the supply of Michigan hardwood will be very scarce. While all the lumbermen are well equipped to make an enormous cut, the non-appearance of snow is keeping them guessing.

The Thomas Forman Company reports having had the best January business in many years. Business still continues to be brisk with prices very satisfactory. A representative of the company says that the large amount of building being done in Detroit has kept it busy every minute and that prospects for the remainder of the winter are very encouraging. Hardwood flooring and finish are in big demand and the supply is a trifle short.

One of the new lumber and finish companies in the Detroit field has filed articles of incorporation as the F. L. Lowrie Lumber & Finish Company. Of a capital stock issue of \$50,000, at \$100 per share, \$25,000 was paid in. Frederick T. Lowrie owns 298 shares and George P. Lowrie and Charlotte P. Lowrie one share a piece. The stock runs for a term of thirty years.

The Hardwood Market

◀ CHICAGO ▶

The situation locally is practically unchanged during the last two weeks. Continued shortage of most lines of stock—and as heretofore the lower grades particularly—together with steadily maintained and in some instances gradually increasing prices, mark the local conditions. Both northern and southern manufacturers with headquarters or representatives in Chicago, and also the larger wholesalers handling northern and southern hardwood stocks, report that they see no chance of material relief in the stock situation for a good many months. The shortage in hardwood stocks has undoubtedly had its effect upon the consumption of veneer as this department of forest products is now enjoying one of the most profitable periods it has ever experienced.

It would be easier to enumerate the woods which are in less active request than those which are in great demand, as practically all grades of all species are selling well. As is everywhere noted, plain red oak is the leading item among hardwoods. Plain white oak continues to be a close second, while the gradually increasing call for quartered oak stock continues to be apparent. Red gum has resumed its former strong position and sap gum is showing rapidly growing strength and an increasing price which will undoubtedly bring it to a more equitable level as compared with the cost of red gum. Increasing difficulty is encountered in securing box lumber and it is not probable that this situation will be relieved to any extent during the present year.

The soft open winter in the North and the excessive rains in the Mississippi producing territory have militated seriously against logging. Some difficulty in securing adequate stock is anticipated by local wholesalers on this account. But it is the unanimous opinion of the local trade that the whole thing hinges upon buying and deliveries, as lumber will sell and sell at a good figure.

◀ NEW YORK ▶

There is nothing of special interest in the local hardwood market. The strong features of the past several months continue in evidence and there is nothing to indicate any relaxation in the market. Some advances have been noted since the last report, particularly in ash and oak. Maple has also advanced. There is no need to worry about the demand for good lumber, and the improvement in call for lumber of lower grade is encouraging. Any change in the general lumber market for the next six months or more will be toward advanced prices.

◀ BUFFALO ▶

The hardwood trade is doing well at present and the past month was above the average in extent of business. Dealers state that the mild weather has made it difficult for many mills to get their log supplies and this has had a strengthening effect upon prices, which already were firm. There is a good deal of difficulty in getting dry stock of various woods and the outlook is for firm prices in the near future.

Quartered oak is beginning to show a little more strength and even the common grades, which have been in small demand for some time, are now firmer. Plain oak sales are being made in good quantity at the usual firm quotations. Maple and birch are strong and flooring in these woods is bringing higher prices. Ash is a little more active. The low grades of all hardwoods are in small supply and poplar and basswood show much strength, being considerably higher than last year.

◀ PHILADELPHIA ▶

The hardwood situation remains unchanged from a fortnight ago. Balance sheets are all taken off and other fiscal matters disposed of, and where to secure the necessary stock is now the paramount consideration. Both the wholesaler and consumer realize that in this matter they are up against a hard problem, and the depleted stock pile at the mill end and the inclement weather conditions in the Southland give little hope of a near solution. For many years the manufacturers have not entertained so many visitors, all pleading for some of their stock, and at their own price.

The consuming industries continue active, and a stout optimism obtains everywhere as to outlook. Plain oak continues leader among the woods; quartered oak is still climbing; ash gains; gum in the eastern market is in good demand; beech, birch and maple hold a good place; poplar remains steady and chestnut makes new friends. There is no weakening in cypress and the mahogany market is strong.

< PITTSBURGH >

Hardwood matters here are in first-class shape. About the only thing that has caused any prospective let-up in demand just now is the fear of a general firemen's strike on the eastern railroads which will very seriously cripple everything in the industrial and manufacturing lines. So far as the manufacturing trade is concerned, hardwood-using concerns are taking much more hardwood than they did last January. Their requisitions are very much larger and their buying nerve is apparently a good deal better. The tendency in all lines of hardwood is toward higher prices. Everybody follows their stock quickly. Even yards are beginning to get pretty tasty in their demands for prompt shipments, for those retailers which supply manufacturing and industrial trade on a small scale are pushed to it hard to get lumber on short notice for their customers. The building outlook seems to be much better than last year. All around hardwood men are feeling good and if they can get the lumber have no fear at all about selling it.

< BOSTON >

There has been no abatement in the strength of the hardwood lumber market; in fact, prices in some cases are held with even more firmness than they have been. Taking the demand as a whole, it is very satisfactory. The large manufacturing consumers of hardwood lumber have been very busy. Furniture manufacturers have also been busy. There is considerable veneering being used and the outlook is that the demand for veneers will become still more active. All reports from manufacturing centers indicate small stocks of dry lumber. According to reports received here, many manufacturers have been handicapped by being unable to get laborers this winter.

There is a strong demand for plain oak and prices are very firm. If a buyer really insists upon prompt shipment he is often obliged to pay a slight advance over the general asking prices. Quartered oak is also very firmly held. There is a good demand for black walnut. This wood has been in small offering for some time and prices are noticeably higher, especially for walnut of good thickness. Demand for ash and birch has ruled rather quiet, but prices are well held.

< BALTIMORE >

No weakness has developed in the hardwood trade during the fortnight. Quotations are either very firm or a further upward movement is taking place. This, at least, is the case with regard to oak, which wood has shown additional strength in the last week or two. As the millmen are getting plenty of inquiries they naturally feel that the business will stand another raise, and many of them are marking up their figures, much to the uneasiness of the wholesalers, who maintain that they find it increasingly difficult to place stocks on the basis of the higher prices. If the quotations get up too high, the yards manifest a tendency to hold off and to provide only for immediate necessities. This, according to wholesalers, is already being done. The objection is also raised that when prices reach a certain level, the consumer will turn to substitutes, and in support of this assertion the present situation with respect to yellow poplar is pointed to. There was a time when yellow poplar had a most receptive market, but since the range of prices has been soaring, buyers turn to other, cheaper woods, which may not be so desirable for various purposes, but are none the less made to fill the bill. The noticeable improvement in extra wide poplar continues and with all other divisions of the hardwood business in good shape, the members of the trade have ample reason to feel satisfied.

There are increasing indications that trans-Atlantic steamship rates may not keep up to the notch set in the contracts which exporters were asked to sign last December. Some of the current rates offered are five and six cents below those which the steamship agents were willing to quote at the beginning of the year, though, of course, the contract rates are still lower than the current rates offered. Talk about the possibility of an ocean rate war is more definite, and the exporters are disposed to hold back in the hope that they may benefit. Meanwhile the foreign buyers complain that prices here are too high for the foreign trade, and that there will be material curtailment if the quotations are adhered to. In view of the brisk domestic demand for all woods, however, there is little or no prospect that figures will be reduced. Chestnut is very firm, even sound wormy moving in such quantities that the mills are unable to accumulate stocks. Ash is in much the same position, and all other items on the list are very active. The open winter is aiding production, but evidently so far without any progress toward a making up of the shortage in stocks which developed a year ago.

< COLUMBUS >

Despite the fact that winter is usually a dull period, the hardwood trade in Columbus and central Ohio has been very active during the past fortnight. The demand from yards and factories has been good and the movement has been very satisfactory. Prices have ruled firm in every variety and grade and recent advances have been made in several items. One of the best phases of the trade is the fact that both yards and factories appear to realize that high quotations have come to stay and, as a result, they are buying more freely now. Yard stocks are

light and retailers are buying for the spring building rush. Factory stocks are also light.

There is a good movement of the lower grades. Dry stocks are light in every section and in some cases almost any reasonable price can be asked for stocks. Automobile concerns are now good buyers and the same is true of factories making vehicles and implements. Furniture factories are expected to be in the market soon, as the shows are about over.

Quartered oak is firm and the demand is good. Plain oak is one of the strongest points in the market and both white and red are moving well. Poplar is also moving well. There is also a good demand for ash, basswood and chestnut. Prices are firm.

< CINCINNATI >

Recent reports show business to be in a very healthy condition. Inquiries have been numerous and cover practically all of the hardwoods. Prices are high on all items and apparently there is no chance for cheaper lumber. While there is quite a little stock on stocks at the present time, and present weather conditions are favorable in many producing points, manufacturers find little difficulty in placing stock at attractive prices. Whether or not there is a revisit of high water in the South this spring, hardwoods will be scarce, and should considerable high water handicap the production for thirty days or more, there will be a greater shortage this year than last. Factories in this territory are all busy and there is nothing on the horizon at this time to indicate a dull period.

The movement of plain oak is unquestionably the heaviest and all

HARDWOOD LUMBER CLEAN-UP

Being about to put into commission my hardwood sawmill at Memphis, want to clean up the present stock of well-manufactured, good average length and width, and thoroughly dry hardwoods in Memphis yard, before piling any new stock.

The following is a list of the principal items contained in this assortment:

ASH

1" 1s & 2s.....	15,000 feet
1 1/2" C & Btr.....	75,000 feet
2" C & Btr.....	30,000 feet
3" C & Btr.....	30,000 feet
4" C & Btr.....	25,000 feet

QTD. RED GUM

1 1/4" C & Btr.....	30,000 feet
1 1/2" No. 1 Com.....	20,000 feet
2" No. 1 Com.....	10,000 feet

POPLAR

1 1/4" 1s & 2s.....	20,000 feet
1 1/2" 1s & 2s.....	50,000 feet
2" 1s & 2s.....	10,000 feet
2" Signboards.....	25,000 feet

QTD. WHITE OAK

1 1/4" 1s & 2s.....	25,000 feet
3/4" No. 1 Com.....	25,000 feet
1" No. 1 Com.....	50,000 feet
1 1/4" No. 1 Com.....	20,000 feet
1x2 1/2 to 4" 1s & 2s Strips....	50,000 feet
1x2 to 4" No. 1 Com. Strips....	150,000 feet

QTD. RED OAK

1" 1s & 2s.....	20,000 feet
1 1/4" 1s & 2s.....	25,000 feet
1 1/2" 1s & 2s.....	8,000 feet
3/4" C & Btr.....	19,000 feet
1" to 2" No. 2 Com.....	35,000 feet

C. L. WILLEY, Chicago

Largest Mahogany Veneer and Lumber Producing Plant in the World

grades are very strong. Quartered oak is moving well and commanding a better price than formerly. Ash is a ready seller, thick stock being very strong. Poplar, basswood, gum and cottonwood are high in price and very scarce.

The market is very active on low-grade cypress at stiff prices. Shop and better is in good demand but will be much improved by the opening of the building season. Planing mills are very good users of the latter grades at this time. Dressed or yard stock is a little off at the present time.

There is a growing demand for the better grades of poplar, and while prices remain as during the past several months, the opinion is general that better prices will prevail should the demand continue. Low-grade stock is in strong demand and is very scarce. Prices are the highest in years.

All planing mills are still very busy getting out stock for immediate use. This is principally in the finishing lines, but quite a little of it is for work on buildings recently started. The popular trend is still toward red gum for interior finish where a moderately priced hardwood is desired. Builders have found that gum has stood the test, the results obtained being very satisfactory. Architects do not hesitate to specify gum and a steady increase in its use is assured. There is, of course, much oak used, both fumed and early English finish, also mahogany in the more expensive homes and buildings. Birch is another wood that is popular and is used largely as a substitute for mahogany.

◀ TOLEDO ▶

There is but little change in the local hardwood situation. Prices are holding firm with an upward tendency. There is a decided scarcity in certain lines, especially in low grades, which are in great demand. Plain oak is strong at present and there is also a good market for hickory, dry stocks being scarce. The conditions in the South are still unfavorable, owing to the heavy floods of last season and the open winter which has made it difficult to get out the timber. Inquiries are numerous and orders are coming in well for bending material, while sash and door concerns have been ordering liberally. Hardwood flooring is in good demand, especially from the local field. Boxing and crating materials are scarce and high and much wanted. The outlook generally is considered good. Speculative buying is not being indulged in, but some moderately heavy orders are being placed to take care of the spring business, which it is believed will be even larger than last season, which was a record year in Toledo.

◀ INDIANAPOLIS ▶

Hardwood interests are well pleased with the volume of business they had in January and with the prospects for the immediate future. The January business was better than that of the corresponding period last year and prices are steady. It is predicted that some grades of hardwood will advance shortly.

The veneer mills are having an excellent business and predict that they will have a much larger demand for veneers this year than last. Furniture factories are looking forward to a record-breaking trade. The automobile business is slow at present, but doubtless will show improvement in the spring.

Building operations are breaking previous records and much building is in sight that will require considerable hardwood for interior trim.

◀ MEMPHIS ▶

The demand for hardwood lumber here continues good. Some members say there is perhaps not quite as much activity as there was a short time ago, while others say they are having all the business they can handle. The tone of the market is quite good. In fact there is a tendency toward a slightly higher level in some directions. The smallness of dry stocks has been a feature for some time. At present production is on a pretty good scale but the outlook for a large timber supply is not particularly bright, especially in the late spring, with the result that there is a disposition in some quarters to anticipate a further reduction in shipping dry holdings in the South. The demand is particularly good for the lower grades of cottonwood and gum, which are somewhat scarce and which are firmly held. Box factories are working on full time and the other industries consuming these grades are also taking their full quota. There is also a very satisfactory call for all grades of plain oak both red and white, with the preference for thin. Quartered oak is about steady at the recent level and the same is true of ash and cypress. It is expected that the adjustment of the differences between the steamship companies and the railroads west of the Mississippi river will stimulate export business because facilitating the handling of export shipments. After March 3, these exports will be handled on through bills of lading instead of on local bills as heretofore.

◀ BRISTOL ▶

Trade conditions here are favorable. Business is brisk and is improving steadily. The prospects are considered the most favorable for a long while. A large volume of business is being done and much more would be done but for the scarcity of stocks. Most of the mills are run-

nlag and owing to the unusually mild winter thus far, have been able to accomplish much more than usual. The output from this section will be considerably larger in a few weeks when the many small country mills that are now idle are again put into operation.

< LOUISVILLE >

With lumber in fair supply and the demand well above the average, hardwood men in this market feel that 1913 is doing all that could have been expected of it. It was felt all along that the first six months of the new year would bring good business, so that the present eminently satisfactory conditions were in a measure expected. Nevertheless, the realization of a prospective outline of future developments is a pleasing thing, and is thoroughly appreciated by those in a position to take advantage of the business that is offering itself. Some items of stock are rather scarce, and of course lumbermen who have stock on hand are able to dispose of it at a fairly stiff premium. Hardly anything, in fact, is found to be oversupplied, as indicated by the fact that some of the largest manufacturers are themselves in the market for lumber with which to take care of their requirements, having found the run on certain items greater than they had anticipated. Consumers in all lines are taking an optimistic view of the situation, and are operating actively. With the railroads buying, and furniture, piano, implement, vehicle and other large wood consuming interests making hay while the sun of prosperity shines, there is certain to be plenty doing for the hardwood man.

Prices are stiffening generally, and the advances which have been made are likely to prove permanent. Of course, if business in general is seriously affected by tariff revision, poor crops, or any other untoward factors, lumber will also suffer; but as there is no need of crossing bridges until they are reached, hardwood men are taking an aggressively cheerful view of things and are not trying to discount future improbabilities.

< ST. LOUIS >

The hardwood situation is improving and some activity is reported among the St. Louis hardwood yards, although weather conditions during the past few days have not been such as to permit of much loading. Snow and cold weather is proving a handicap to shipments being made. Inquiries are increasing right along. The dealers are feeling quite optimistic over future conditions. They believe prices will make further advances, more particularly on items and grades most in demand. Mill supplies are very low, and although operations have kept up nearly to the first of the year, the output will not catch up with the demand. Buyers who have been covering the South looking for dry lumber report a great scarcity of dry stock. The demand at present is mostly for plain oak and ash. There is also a satisfactory call for gum, cottonwood and cypress. Poplar also is being called for quite freely. The demand for lower grades on all items is increasing and will no doubt continue under the present milling conditions. Cypress is also showing quite a little improvement and good orders are being sent in by traveling men as well as coming in by mail, the latter mostly for quick shipment. Inquiries are also showing an encouraging increase.

< MILWAUKEE >

The activity on the part of local manufacturing concerns seems to be the leading factor in bringing about the steady improvement which is taking place in the hardwood trade. Practically all the concerns have finished their annual inventories and repair work and again have their plants in operation. Consequently, they are in the market for stock. The genuine shortage of most lines of hardwood, coupled with this increased demand, has caused advances in some lines of upper grade stuff. Higher prices in most lines are expected before the close of the season. Stocks in the hands of jobbers are light, and, as their orders must be placed early in the year, there is no question but that the factories will have all they can do from now on.

The outlook at this time in the building field is indeed bright. There has never been a time in the recent history of the Milwaukee building inspector's office when there has been so much building carried on during the winter months, probably due to the favorable weather which has been received. Contractors and architects say that inquiries which are being made would indicate a busy spring in the building field.

Upper grade birch is practically exhausted, while the supply of No. 2 and No. 3 is exceptionally light. Both plain and quarter-sawed oak is scarce and light shipments are arriving from the South. Basswood in all grades is moving fairly well. Increased activity at all the farm implement plants here and about the state has resulted in a brisk demand for hickory and ash. Poplar is wanted, but the supply is light.

< DETROIT >

The Detroit hardwood market has shown increased strength in the past thirty days. Prices have been steadily increasing on all grades of hardwoods and dealers report a steady demand. Owing to the mild winter building operations have been carried on steadily and this has kept the hardwood dealers busy. The flooring trade is exceptionally busy and there has been a good advance in the price of flooring due to the increase in the price of rough stock. The veneer and box trades have also been very busy.

“But, this is a special request from Mac.”

“All right, John, go ahead and buy them; if Mac says he wants Simonds Saws throughout the factory, let’s have them.”

“Shall I include an order for some of the Novelty Saws?”

“Yes, of course; for that fine work of ours Simonds Novelty Saws will be just the thing. Mac has tried out this one, and say—you would be surprised to know that a saw can make such a smooth cut.”

Buyers of Saws, Planer Knives, or Files for factory and mill use should remember that the Simonds reputation does not rest alone in Big Circular and Wide Band Saws, but that our Small Saws are equally desirable.

HARDWOOD RECORD CHICAGO

Baldwin Geared Locomotive

Logging Locomotives must operate on steep grades, sharp curves and uneven tracks. This is what the geared locomotive illustrated has been designed to do. It is symmetrical in construction, and power is transmitted to the axles through a central drive. The valve motion is simple and accessible, and all new features have been tried out in service.

This locomotive is well-designed, well-built and fully guaranteed. Various sizes can be furnished, to suit different track and operating conditions.

Westinghouse Motors form the Reliable Drive for Wood-Working Plants

AFTER Westinghouse motors are properly installed in a wood-working plant, the only attention they require is an occasional cleaning, inspection and lubrication. Beyond this, there is nothing to be done.

They are ready to start any moment they are wanted and they keep the machines they drive in continuous operation until the power is shut off. They are very rarely out of commission for repairs. Their life is very long; some of the first Westinghouse motors are still in successful operation.

Such reliability is the result of long experience in design, thorough study of operating conditions, and great care in manufacture. These factors combine to make Westinghouse motors more reliable than the service conditions, for which they are intended, require.

Of course, like any other machines, these motors must be properly installed. Westinghouse service takes care of this detail by giving full information on the installation of Westinghouse motors in any plant.

To receive full assurance of motor reliability, specify "Westinghouse Motors."

Westinghouse Electric & Mfg. Co., East Pittsburg, Pa.

Sales Offices in all Large Cities.

One of the largest hardwood operators in the U. S. says:

costs 50 cents per M.

From the time we stop skidding we can move the machine from 200' Edd. to 1/4 mile, and be skidding again in thirty minutes. There is no comparison in the old and new way of moving the machine, and skidding logs. We think your skidder is the best on the market, and there is no comparison to be made between the ground skidder and overhead system for hardwood timber.

Yours truly

(Copy of complete letter sent on request)

You should investigate the

Clyde Self-Propelling Skidder

It means more logs for less money than by any other method—and we can prove it!

Automatic Dovetail Jointing Produces Strong Resawed Stock

THE method of jointing lumber automatically at one operation offers many advantages in building fine furniture, besides the strength and quality of the tapered wedge dovetail glue joint. There is a big advantage in being able to joint rough edge lumber without ripping or squaring the edge; the economy in floor space by jointing on one machine, the exclusion of trucking, the saving of lumber labor and glue that is made by the "Linderman" Automatic Dovetail Glue Jointer, Gluer, Clamper and Sizer are points that are invaluable to every builder of furniture.

If you so desire, samples of the kind of work you are making will be sent you.

Linderman Machine Company

Resawing Dovetail Joints

The tight fitting dovetail joint can be resawed in any place; but where a great strength is required, the cutters can be placed so as to leave a dovetail in each resaw piece.

The illustration here represents a piece of $1\frac{5}{16}$ " stock resawed in the center with a dovetail in each piece.

YOU pay a *little* more for our hardwood lumber than you do for many others', but it's worth *much* more.

With our modern and first-class equipment and expert operatives, we couldn't make bad lumber if we tried to, because the *quality* and *size* of our virgin tough mountain white ash, red birch, yellow poplar, buckeye, maple, red oak, cherry and basswood, averaging less than three logs to the thousand, and 95 per cent sixteen feet, is the best type of hardwood timber growth in the United States, and shows a larger percentage of *firsts*.

If you are a discriminating buyer, let's get acquainted.

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

 If we can do it for him is there any logical
 reason why we can't for you?
 MAKE US PROVE IT
HARDWOOD RECORD, CHICAGO

Welcome to Our City

When you are buying your ticket for a trip into the hardwood country, don't forget to tell the man to make Louisville, Ky., your destination. It's unnecessary to arrange merely for stop-over privileges, for the reason that when you get here we'll make things so interesting for you that it will be unnecessary to proceed further.

You know all about the traditional Kentucky welcome, of course, and it's taken for granted that you realize that this is still on tap, ready for wanderers like yourself who don't have a chance to enjoy life in God's country very often. But we've got more than a mere welcome; what is more to the point, we've got the goods.

In these piping times of good business, with everybody in the market for something or other, and a lot of items as hard to find as the storied needle in the hay-stack, the advantages of trading in a market like Louisville are even more apparent than at other times.

That is to say, you can get quartered oak, and plain oak, and poplar, and ash, and hickory, and mahogany, and veneers, and panels, and about everything there is to be had in the hardwood line, right here; it's a good deal like going into a department store and buying a refrigerator in the basement, a diamond ring on the first floor, a suit of clothes on the second and a dinner on the roof. Anything you may happen to want is here. If you don't see it, ask for it.

We'll be looking for you.

Ask your competitor to tell you how it has helped him, and then write us for details.

HARDWOOD RECORD,

CHICAGO, ILL.

500 Copies Sold Within a Week After Prospectus Was Issued

Hardwood Record announces the issue on March 15, 1913, of an Authoritative Commercial and Scientific Book

American Forest Trees

By **Henry H. Gibson**, Editor *Hardwood Record*
 Edited by **Hu Maxwell**, Wood Utilization Expert

The Work Involves :

First: A botanical description of the more than 300 species of American forest tree growth.

Second: A physical description of the wood of these species.

Third: A recital of the chief uses of all important American woods, together with suggestions of advantageously broadening their uses.

Fourth: Complete information concerning the range of growth of all varieties.

Fifth: Related trees are logically grouped according to families and spe-

cies; important species covered in substantial detail, and brief mention of the woods of minor importance.

Sixth: Scientific name of each tree is recited, as well as the various common names by which it is recognized in different parts of its range of growth.

Seventh: The properties of the various woods are carefully analyzed, particularly weight, hardness, stiffness, strength, elasticity, toughness, color, figure, and seasoning and lasting properties.

☐ The book will contain between 650 and 750 pages, will be printed on the best quality of enameled paper, and handsomely bound in half leather, dark green roan back and corners, with basket cloth sides, silk head-bands, gold stamping on the back, and gilt top.

☐ The work will be illustrated with more than 100 full-page pictures on plate paper in sepia, outlined in orange, from photographs, covering all the chief commercial varieties of virgin forest timber growing in the United States; and also with numerous engravings, from drawings and photographs, showing leaf and flower forms, etc.

☐ The price of the work is \$6.00, delivered by express or mail, and is sold only on subscription.

☐ An order blank, and a prospectus, showing the character of the paper, size of page and style of printing will be forwarded on application.

Review and Outlook

General Market Conditions

CONTINUED POOR LOGGING WEATHER in the South, fair logging conditions in the North, and uninterrupted demand with steadily increasing prices in a good many items of hardwood mark the general situation at this date. There has been some disposition noted on the part of the buying trade to withhold large contract orders in anticipation of a general break in price; but it is safe to predict that their expectations in this particular will not be fulfilled. This disposition, while reported from a number of centers, is not prevalent and does not mark the view which any considerable percentage of buyers take of the present market. It is impossible to see any radical change in conditions for months ahead. Northern mills will certainly not manufacture any more actively than they are doing at present and the wretched weather in the South has been a serious factor with the millmen. It is a perfectly safe prediction that a gradually stimulated and uninterrupted demand will mark the coming year. All consuming factories are now actively in the market. The factory trade is as a whole calling for considerable quantities of lumber in anticipation of spring activities. This demand is not going to decrease, but will, for the most part, very likely increase as but a small percentage of consumers have been able to completely replenish their depleted stocks. The railroads are actively in the field again and decisions are noted on the part of the directorates of various important systems which will provide for considerable expansion and repair work. Quite a number of unusually large ear orders, in which are included a great many ears of wooden superstructure, have been placed during the last few weeks.

The situation confronting the consumers of box lumber continues about as it has been, with probably a slightly increased level of prices on such material. The box trade is taking all it can get of low-grade lumber and seems to be taking the situation philosophically, realizing the futility of endeavoring to lower the price of such material with the present active demand for it from many sources outside of box manufacture.

Oak, of course, is still king; but, judging from the reports from different hardwood centers, ash is pushing it pretty closely; in fact, the demand for ash is surprisingly active. In oak, plain-sawed stock is, as for some time past, strongest, although continued increase in call for quartered oak is noted everywhere; in fact, the demand of late has been so active that some quarters report scarcity of dry stock. It is difficult to find a standard American hardwood right now which is what could be called long on the market.

With the spring months coming on and the consequent opening up of building operations all over the country entailing the consumption of vast amounts of construction and finish lumber, and later large

amounts of lumber going into the house finishings and furniture, it is impossible to perceive just how the situation can be materially altered.

A Condition, Not a Theory

THE CARTOON IN THIS ISSUE of HARDWOOD RECORD aptly depicts the hardwood situation. The demand for hardwoods is far in the lead of the supply, and far in advance of any possibility of the supply catching up with the demand for at least some months. No matter what the ambition of lumber manufacturers may be to materially increase their output at the present time, and during the coming spring, it is impossible for them to do so either by reason of a paucity of timber supply tributary to their mills, or by reason of such bad weather conditions as to render increased logging impossible. Logging conditions in the north-country have been far from favorable during the winter, and while many manufacturers anticipated being able to increase their output, in very few instances have they done so.

In the Mississippi valley hardwood district high water and bad weather have seriously militated against even a normal log output, and when logs were actually ready for shipment the railroads were unable to supply cars or handle them to even nearby mills. Perhaps the best logging situation that has prevailed in any part of the country during the winter has been in the mountain regions of the East. Weather conditions have been fairly favorable and a very good stock of logs has been obtained, and such as were rafted have come out to the mills in very fair volume.

On the whole, however, the visible supply of logs back of hardwood mills at present is very small, and there is no reason to believe that the supply of dry lumber will equal the demand for a good while to come. Hence buyers who are holding off making purchases with the hope that there will be a decline in the lumber market are figuring on an untenable basis. It is thoroughly believable that the price of some hardwoods will materially advance in the near future, and that there is scarcely an item that will show a decline between now and mid-summer.

Preventive Appliances

THE NATIONAL ASSOCIATION OF MANUFACTURERS has issued as a supplement to "American Industries" published by that association a four-page insert devoted to the illustration of practical safety devices typifying in concrete form the work of the National Association of Manufacturers. This pamphlet as far as it is read should enable manufacturers, superintendents, foremen and workers to appreciate that one phase of safety engineering consists of a mixture of common-sense and mechanical ability and

also that without the fullest co-operation on the part of the workman himself the fullest purpose of the accident prevention is defeated. The insert is the first of a proposed series of similar inserts, each one of which will deal with a particular danger and will describe and illustrate specific means by which such points of danger can be covered in a practical manner.

What has been needed in the matter of accident prevention has been less agitation and more uniformity of methods. This endeavor on the part of the National Association of Manufacturers is surely one which will eventually result in considerably simplifying preventive devices and will ultimately effect uniformity in methods and in appliances for the purpose of guarding various dangerous machine parts. The inserts will be contained in each issue of "American Industries" published once a month and will ultimately effect a vast amount of good if every employer of labor operating an industrial plant will secure the supplement and follow the suggestions contained.

Lumber Cost—Present and Future

SOMEHOW A NOTION PREVAILS pretty widely that the price of lumber in this country is in someway controlled by a combine, a trust, a monopoly, or something of the sort; that if the people could get round some obstacle—the exact nature of which nobody appears to be able to define or describe—lumber could be bought for less money. Persons well informed in the timber trade and lumber business know better, but too many people have never inquired into the matter, and accept groundless suspicions as facts.

There is no general combination to enhance the price of lumber to the consumers. If there were, the evidence of it would exist in the price. Lumber at the present time in this country is one of the cheapest commodities consumed by the people. It is cheap in comparison with prevailing prices of other necessities. Almost everything else costs more in comparison with former prices. Other commodities have gone up much faster than lumber has. There is as much genuine competition among the manufacturers of lumber as among the growers of potatoes, corn, and cattle, or the manufacturers of clothing, shoes, hats, and furniture.

The latest census statistics show there are 31,934 active sawmills in the United States, and this does not include mills which cut less than 50,000 feet a year. There are probably over 15,000 of these little mills. The total for the whole country doubtless exceeds 45,000 sawmills, large and small. They are located everywhere, except in the absolutely treeless region. Every mill that is cutting lumber is trying to sell it, and is bound to sell it in order to keep going. The lumber is not thrown into a great pool, where somebody fixes the price and sells at that price; but competition governs, and the competition is as genuine and as general as that found anywhere else. The result is that Americans buy their lumber as cheaply as any people, and much more cheaply than most people are able to buy.

Not only is lumber cheaper here than in most other civilized countries, but it is cheaper now than it will ever be again. The reason for the present cheapness is not far to seek. The timber which the mills are now harvesting was planted and matured by nature during the past hundreds of years, without the help of man, and at no cost to man. Nature, with unprecedented generosity, gave this timber to the present generation as a free gift, and the present generation is now engaged in reaping the harvest which it did not sow.

This timber planted by nature will not last forever. Most of it has been cut and the remaining areas are going year by year to the mills. What will happen when it is gone? Prices will advance as supply decreases. Up to the present time there has been no real timber scarcity, though some kinds are becoming depleted. When one kind has been depleted or largely reduced, a substitute species has been found. That has kept prices down; but the process of finding substitutes cannot continue indefinitely. No additional sources of lumber remain to be discovered in this

country. All is in sight, and mills are at work on practically all of it.

When timber planted by nature has become reduced to a low point, and supplies become dependent upon the products of private forestry, there will be an advance in lumber cost which will make present day prices look very small. That time is not yet here, but it is coming. It is not necessary to cross the bridge before it is reached, but it is well enough to look ahead when a disposition to complain of present day lumber cost is felt. When the private woodlot becomes the chief source of lumber, timber cannot be bought for two, three, or five dollars a thousand, but stumpage alone will then cost about as much as lumber retails for at present.

Some who look forward to the time when timber scarcity will cause prices to advance sharply, expect the timber on government land to save the day—provided the state's rights movement does not succeed in getting the timber away from the government before that time. It is well enough to count on government timber to help, but it should not be blindly depended upon to keep prices down. In the first place, there is not enough of it—only one-fifth of the whole supply at present, and in the second place, it is not the government's policy, and it never should be its policy, to break an honest market by underselling. All that should be expected of it is, to help supply the people with lumber at prices fixed by the law of supply and demand.

The nub of the matter is that present prices of lumber are low in comparison with other commodities; that they are fixed by keen and general competition; and that a forecast of the future, in so far as facts warrant, indicates that much higher prices than the present are bound to come.

An Unreasonable Expectation

WITH ALL DUE RECOGNITION of the important part the box trade has held in the marketing of low-grade lumber, it is hard to recognize in certain suggestions emanating from well-known individuals connected with the manufacture of boxes, the logic which would win from the lumber trade the attention desired. It is manifestly an absurdity to ask the vendor of any commodity to voluntarily dispose of his goods at less than prevailing prices and, in view of the unfavorable position which low-grade lumber of all kinds occupied for a long time, any suggestion that a less than present market price be asked for such stock has, to say the least, a very meagre chance of even being considered seriously.

While it is recognized that such an expectation must be based on sincere motives, still it is undoubtedly the result of a wrong interpretation of the conditions governing the low-grade market. In the first place, the present satisfactory prices are the result not of any concerted effort on the part of the lumber trade, but are rather the result of the working of the time-honored law of supply and demand. The talk of scarcity of low grades is not idle and meaningless babble, but describes an actual condition. The consumers of low grades have made present prices possible, not the producers. A striking proof of the validity of this assertion is shown in an experimental arrangement recently effected at a northern pine shipping point. It was agreed that none of the firms involved would in any case quote a price on low grades, but would rather let the inquirer name his figure. There is evidence to prove that this suggestion was closely followed and yet the price of low-grade pine in that city advanced with astonishing rapidity.

The second point of which the box trade has a wrong conception is as to the relative importance of the box trade as a low-grade market, particularly for hardwoods. It is true, of course, that a vast amount of low-grade lumber has been and always will be used in box manufacture, but if the box man believes that the present shortage of low-grade hardwoods is due alone to increased demand from the box trade, he should be disillusioned. As a matter of fact, lower grades in all hardwoods are meeting with increased favor and, with a broadened market and closer

utilization and considerable quantities of such stock going into ties, there is every reason to believe that as the years go by, lumber manufacturers will be increasingly less dependent upon the box trade for an outlet for the poorer products of their mills.

It is a worthy suggestion advanced by the box men that fibre containers will gain in favor with increasing prices of wooden containers. It must be conceded, however, that any change from old methods is merely a mark of progress and that if a fibre container demonstrates its superiority for carrying a commodity of a certain character, its use in packing that commodity will follow regardless of any price question and in spite of any efforts to combat it. It is equally manifest that the number of places where the fibre container can be used to better advantage than the wooden container is exceedingly limited and with fair treatment in rate classification the problem will eventually solve itself. It is not to be supposed that any shipper will continue to use fibre containers after they have been tried and found wanting. While it is easy to counsel "patience," still that advice seems the most pertinent. After a thorough comparative trying out of the different classes of containers, it stands to reason that the eventual adjustment will be along lines of actual utility and in keeping with industrial progress.

Low-grade lumber is scarce and will probably never be as plentiful as it was. It is estimated by one competent to judge that Wisconsin and Minnesota together contain only 5,000,000 feet of No. 4 and No. 5 pine lumber unsold and that 6,000,000 feet is the total of unsold low-grade hardwoods in Michigan. With similar conditions prevailing with other woods, it is apparent that the box men are endeavoring to crack the wrong nut.

Higher prices for boxes, not lower prices for lumber are what they should seek. The latter condition is impossible of accomplishment while the former is a concrete possibility for, as before stated, utility and not price is, in the long run, what governs the shipper in his selection of a container.

Fire Risk in Wooden Buildings

IN ACCOUNTING FOR THE GREAT LOSS BY FIRE in towns and cities of this country, wood receives a great deal of blame which does not belong to it. Of course, wood will burn, and in nearly all fires where any considerable loss occurs, wood helps feed the flames; but the point that calls for comment is that statistics show the principal losses from fire are not among the wooden buildings, but in business sections where most of the structures contain comparatively little wood, and are supposed to be partly or wholly fireproof. Some alarm has been expressed on account of what seems to be a great and abnormal increase in fire loss. Various reasons have been suggested for it, and one that is most generally put forward is the wooden building. That has sounded so reasonable that many have accepted it without taking the trouble to inquire whether the conclusion is justified by the facts.

It is clearly not justified, according to the best information. The greatest losses do not occur where wooden structures are most abundant, but where they are fewest. The frame houses in residence sections of cities and towns, and the wooden barns, residences, and school houses in the country are not the places where fires originate as a general thing; but, rather, the fire that causes the damage usually has its origin in business places, and it is of comparatively rare occurrence that wood is the cause of the start

or rapid progress of the destructive fires which have been responsible for heavy loss.

It is well known that in nearly all costly fires it is the contents of building rather than the material of construction which give momentum to the fire and cause the loss. Where the building has been properly done, and intelligent precaution is taken to lessen danger, wooden buildings stand about as long as those of any other material. It would be bad policy, of course, to construct city blocks of wood, because a fire in such a place would be likely to get beyond control, but within reasonable limits and in its proper places, the wood in building is not a menace.

Milling-in-Transit Order Issued

ON FEBRUARY 17 THE INTERSTATE COMMERCE COMMISSION issued at Washington its final opinion and order regarding milling-in-transit regulations. The order instructs the railroads that they are at liberty to proceed to draw their own rates, regulations and tariffs on milling-in-transit business, but that they must keep such rules strictly within the law.

The opinion included draft of a rule adopted at the shippers' conference which would act as a substitute for rule No. 76, but said:

"Upon careful consideration of the whole matter, it is our opinion that we should accede to the request that rule No. 76 be cancelled, but, on the whole, we do not think it would be wise, even if within our province, to publish as a ruling of the commission such requirements as have been proposed. It is our best judgment that the policy of not making orders and drawing rules or expressing views as to what would or would not under certain conditions be considered a violation of the law as to transit privileges be not departed from by

us, as the carriers are charged with the duties of initiating their rates, regulations and practices under their own responsibilities and liabilities imposed upon them by the act, subject to the appropriate action by the commission or the courts in the event they are found in violation of the law."

The statement by the commission also provides that if at any time shippers feel that milling-in-transit rates are discriminatory or in any way unjust or unreasonable or if the commission itself deems such conditions to be not entirely satisfactory, a new investigation on the subject will be instituted.

The rule cited by the commission as submitted by the shippers' conference says:

When rules and regulations have been established in tariff form clearly defining the purpose or purposes for and the terms under which the transit privileges are granted, and providing also for the effective policing of the operations, under the arrangement a shipment may be stopped in transit and the same shipment or a proper equivalent (less invisible loss in weight), as set forth in said rules and regulations may be forwarded by the through rate provided for by tariff from the original point of shipment to final destination, plus the charge for transit privilege, if any. This rule shall not be construed to authorize the publication of tariffs providing for the substitution of one commodity for a commodity of a different kind; that is to say, oats or the products of oats for corn or the products of corn, or shingles for lumber.

It was further stated in the opinion that one of the main reasons for setting aside milling-in-transit privileges was the fact that such privileges have been very much misused and that milling-in-transit rates had not always been what they purported to be. The railroads have also, according to the opinion, stated definitely that they are able and willing to promulgate and enforce proper rules and regulations governing the milling-in-transit privilege question.

UNSOLICITED TESTIMONIAL

Minneapolis, Minn.,
January 13, 1913.

Hardwood Record,
Chicago, Ill.

My Dear Mr. Gibson:

Your January 10th issue came in this morning and I am impelled to drop you this line to say how much it pleases me. It certainly is a dandy! You are to be congratulated and I am happy in adding my word to the many you should and doubtless will receive—all in the same vein.

May the year 1913, so auspiciously begun, prove as pleasing and satisfactory financially as Hardwood Record is typographically.

Yours very cordially,

FRANK W. TUTTLE,

Northwestern Lumbermen's Association.

Further reason for the issuing of the new order, according to the opinion, is for the purpose of establishing in the minds of railroads and of shippers taking advantage of the milling-in-transit privileges, the proper relation of tariffs and practices to the law. It stated that tariffs named their privileges in such a manner as to compel their real application and careful inspection showed that rates were not being enforced in accordance with the published tariffs at milling points.

The report pointed out that as a result of the investigations and previous orders, the atmosphere has been cleared and conditions understood and recognized more completely.

The newly issued order closes the ease which has been before the commission and commanded a great part of its time during the past year.

Will Arbitrate Firemen's Strike Question

THE SUCCESSFUL CULMINATION of the efforts to refer to arbitration the differences between the various railroads east of the Mississippi and the firemen employed on their lines at least postpones for a considerable period the hardship which would be experienced by the shipping and traveling public due to the threatened general strike of the firemen's organization. The disputes have been referred to arbitration under the Erdman act, which provides that each factor in the controversy shall appoint a representative. These two men shall get together in an effort to arrive at a common ground of settlement. In the event of their inability to arrive at any satisfactory arrangement, they shall call in a third neutral party upon whom will rest the responsibility for the ultimate settlement.

While there is more or less satisfaction in the immediate postponement of the difficulty, the reference to the provision for compromise under the Erdman act calls attention to the inadequacy of at least one provision of that act providing for an arbitration committee of two or three. It is hardly reasonable to suppose that the two representatives can alone arrive at a satisfactory arrangement, and hence it can usually be expected under such conditions that the full responsibility of the solution of the problem will rest upon the third party. The enormity of this responsibility is hard to comprehend, but some understanding of it can be obtained from the statement of the fact that the demands on the part of the firemen apply to fifty-four roads, and would affect millions of people throughout the country. The immediate effect upon commerce and industry, and hence general business conditions, is fairly incomprehensible. The act which provides that such responsibility shall be shouldered by one man is manifestly weak.

It is to be hoped that the question will be settled amicably, but it is further to be hoped that time will see a change in the present provision for arbitration. However, the main thing is the fact that the strike has been averted, and that this menace will not lend its support to the natural conditions constantly operating as a hazard to the forward march of business prosperity.

Coming National Wholesalers' Meeting

THE SELECTION OF ATLANTIC CITY as the meeting place for the annual meeting of the National Wholesale Lumber Dealers' Association March 6 and 7, as noted more in detail in another part of this issue, is certainly a bit of wise policy on the part of the trustees of the association. This is the first time that the national wholesalers have ever held an annual meeting at Atlantic City. In view of the fact that these meetings have always been marked by strong social features, and further considering that New Jersey's popular resort is now in the height of its active season, the decision should result in an attendance unprecedented in the history of the association.

It has been suggested that the officers and secretaries of the twenty-five affiliated associations invited to the meeting remain over on March 8 for a general and informal discussion of lumber problems. It is hoped that if such a plan goes through the discussions will result in the acquisition of a great deal of useful information by the various officers and secretaries in attendance. It is

planned to talk over such topics as the "Necessity of National Lumber Associations," "Functions of State Retail Associations;" "The Free Interchange of Business Information;" "The Desirability of Uniform State Laws," etc.

Condition of Shipments in Fiber vs. Wooden Packages

WITH A VIEW OF ASCERTAINING the adaptability of the wooden and fiber container for freight shipments, the Santa Fe Railroad has instituted a careful and comprehensive investigation of this question by means of a record covering a ten-day period in January. A record was kept and compiled in the general freight offices of the Santa Fe System, and showed the condition of every package of freight handled packed in either the fiber or the wooden container. The result showed a total of 91,899 packages handled contained in wooden packages. Of these 1,029 or 1.12 per cent were in bad condition. On the other hand, 11,080 parcels of goods packed in pulp or fiber packages were shipped, and of these 4,723 or 42.62 per cent were in bad order.

This should prove an overwhelming argument in favor of a just classification as applied to goods packed in fiber vs. those packed in wooden containers. These statistics cover both outbound and inbound shipments in both classes of packages.

In the wooden packages the outbound shipments show 1.29 per cent to be in bad condition, and the inbound shipments had .73 per cent damaged goods. From this it can be seen that, generally speaking, the damage to goods packed in wooden containers is not the fault of the container, but rather of faulty packing. On the other hand, consider the same figures as applied to the fiber container. Outbound shipments showed damage to the extent of 23.88 per cent of the total number, while inbound shipments showed 50.70 per cent damage. Considering that the inbound shipment has traveled farther than the outbound shipment, it is a reasonable supposition that the damage resulted not from poor packing, but rather from the inadequate character of the material of the container to meet the demands placed upon it by long shipment.

Final Hearing on Car Weights

ON WEDNESDAY, FEBRUARY 26, the Interstate Commerce Commission will hold in Chicago what is expected to be the last of a long series of hearings on weighing practices by railroads. Ward Prouty, examiner of the commission, will preside and the government will be represented by John C. Marshand.

This will be the concluding hearing of a series that have embraced proceedings at Boston, New York, Pittsburgh, St. Louis, Salt Lake City and San Francisco. Thousands of pages of testimony are embraced in the records. Shippers contend that railroads have pursued faulty practices in weighing cars and that many injustices have resulted. The testimony so far submitted would certainly tend to prove the genuineness of such contention.

The commission is seeking to formulate a rule which will be fair to both shippers and carriers. No matter what the final ruling is, it will insure the inauguration of rules and regulations that will at least put the car weighing practices of the railroads on a more just basis in so far as the interests of the shippers are concerned.

Fully Digested

THIS OFFICE is in receipt of a very brief communication from the Fireproof Digest—that was—of New York, an alleged magazine promising to exploit fireproof construction, and various materials entering into this type of building.

The communication referred to reads:

"The publication of Fireproof Digest has been discontinued."

Sad to relate the letter does not advise whether the production of stovepipe steel hollow doors, stuffed with cork shavings has been discontinued or not, but as this was the house organ of that enterprise, it is to be hoped such is the case.

Sheet steel doors when exploited as fireproof are in the same class with steel furniture and other like plunder that has been foisted on the public under false pretenses for some years.

Hardwoods of the Pacific Slope

Editor's Note

The pending opening of the Panama canal naturally raises the question as to what effect it will have on the hardwood business. HARDWOOD RECORD of February 10 contained an analysis of present hardwood consumption on the coast, showing the importance of imported and eastern species. The appended article describes the hardwoods growing in the Pacific states and analyzes the possibility of their more general utilization.

The kinds of hardwood species of the Pacific slope outnumber the conifers nearly two to one, or to be more exact, in the ratio of 94 to 53. This statement is of more interest to the botanist than to the lumberman, for the latter is concerned with timber and not with trees merely. In point of timber production the hardwoods of this region are comparatively insignificant and scarcely a single species can approach in importance any one of the commercial hardwoods of the East. Out of nearly a hundred species scarcely a dozen are of the slightest importance except locally for fuel.

In a region where everything is drawn to so large a scale one might expect to find mammoth hardwoods just as he does pines, hemlock, Douglas fir, spruces, firs and redwoods. But the very conditions which make the coniferous forests the richest in the world are evidently not conducive to the growth of hardwoods, and for the most part those that do exist are mere shrubs, as it were, proportionate in size to the softwood trees.

A glance through the list shows a total absence of any form of many of the trees so common in the East, for example, hickory, elm, chestnut, yellow poplar, red gum, basswood, tupelo, black locust, honey locust, mulberry, Osage orange, magnolia, huckeye, persimmon and catalpa. The oak has sixteen representatives, but even in a region where hardwoods are at a premium, they are of little account for their timber. The only broadleaf tree to attain good dimensions in sufficient quantity to be of much economic importance is the black cottonwood, the largest and best of our poplars.

Briefly summarizing the article referred to in the editor's note it is shown that the hardwoods at present used in the Pacific coast states come from many foreign markets, and only a very small portion of them are local woods. From the eastern states are imported oak, ash, hickory, maple, cherry, basswood, black walnut, tulip poplar, birch and elm; from Honduras, mahogany; from Mexico, Mexican mahogany, prima vera, or jenizero; from Hawaii, koa; from Australia, iron bark (one of the eucalypts) and red bean; and from Japan, Japanese oak.

It is further shown that the hardwoods from the eastern states come for factory use in the rough or "club" form; for the vehicle industry as roughly finished parts, such as spokes, hubs, bent rims, and sawed felloes; and for cooperage as rough staves and heading.

The rest are in the form of 1-inch and 2-inch boards and 3- to 6-inch planks from 6 to 16 inches wide and from 10 to 30 feet long. A small proportion comes in the form of squared timbers up to 20 by 20 inches by 24 feet long.

This is for special-order work. The Mexican, Australian, Hawaiian and Japanese woods generally come in the shape of roughly hewn timbers, the sizes ranging from 14 by 14 inches up to 36 by 36 inches and from 10 to 20 feet long. These rough timbers are sawed into veneer stock, board and planks, as wanted.

Black cottonwood (*Populus trichocarpa*) is found along the coast from southern Alaska to the San Bernardino mountains in southern California. It extends eastward along the Columbia river and is also found as far inland as western Montana. It is most abundant and of largest size in the lowlands in Oregon and Washington. It is the most valuable broadleaf species on the Pacific coast. It attains large dimensions, occasionally 5 or 6 feet in diameter and up to 150 feet high, though usually considerably less. It is nearly always straight, smooth and of excellent timber form.

The wood is of a dull grayish-brown color, soft, light, tough, of uniform and moderately fine texture, straight-grained, odorless and tasteless. The pores are small to minute, thin-walled, angular, those in the springwood usually visible to the unaided eye. The wood seasons without warping or twisting, a decided advantage over the eastern species. It nails readily without splitting, is easily glued, and works very smoothly and readily. Because of its softness, light color and long straight fiber it is especially adapted to pulp and excelsior manufacture. The lack of color in the wood and its cheapness, lightness, and facility in nailing, fit it well for box material. It is also employed to greater or less extent as drawer bottoms, shelving, cores for built-up panels, baskets, saddles, candy and coffee drums, candy pail covers, cooperage, trunks, caskets, pulleys, vehicles and fixtures.

TYPICAL TANBARK OAK TREE SHOWING FIRST FOUR-FOOT RING BEING TAKEN OFF BEFORE FELLING. SHERWOOD, MENDOCINO COUNTY, CALIFORNIA.

The wood-using industries of Washington consume annually over 32½ million feet of black cottonwood. Of this amount 12 million feet goes into boxes; over 7½ million into pulp; a little less than 6½ million into excelsior; and 4½ million into veneer. Oregon's industries require 10½ million feet of this wood, 5½ million going into pulp and 4½ million into excelsior. California's industries consume annually a little over 5 million feet, of which half goes into woodenware and novelties and most of the remainder into boxes.

Oregon ash (*Fraxinus oregona*) is the only timber ash of the Pacific region. It is found for the most part in the vicinity of streams on alluvial bottoms or flats from the shores of Puget Sound southward through Washington, Oregon and California. It reaches its best development in southwestern Oregon. In the northern part of its range it is usually in rather close stands of red alder, Oregon maple and California laurel; farther south it occurs with white alder and California sycamore. Forest grown trees have long, clear trunks and are from sixty to seventy-five feet high and from sixteen to thirty inches through, occasionally larger.

The wood is pale brown in color, quite hard and strong, rather light but tough and resilient. The sapwood is nearly white but with a slight reddish tinge. The wood looks like white ash but structurally is more like black ash. The dry material is subject to the attack of powder-post beetles, which often destroy its usefulness and limit its employment. It is used for many purposes, such as handles, furniture, interior work, fixtures, boats (finish and ribs), vehicles and saddles. About 446,000 board feet of the wood is consumed annually by the wood-using industries of Oregon, but only 58,000 feet in Washington.

Oregon maple (*Acer macrophyllum*), also known as bigleaf and broadleaf maple, is the only commercial representative of maple on the Pacific coast. It makes its best growth in Oregon and Washington coast regions, especially in alluvial river bottoms. Its botanical range extends from Alaska to southern California. It varies greatly in form and height in different soils and situations from a short-stemmed crooked tree from twenty-five to thirty feet high and under a foot in diameter to one from sixty to eighty feet high, with a long, straight, clear bole from fourteen to thirty inches through. It is one of the most important hardwoods in Oregon where about 2,500,000 board feet of the lumber are consumed annually in the wood-using industries. In Washington it is also important though only 300,000 feet are reported as used by the wood-using industries of that state.

The wood is, in structure, more like the soft than the hard maples but is fairly heavy, hard and strong, being intermediate of the two groups. The color is deeper and richer as a rule than in the other maples. The wood turns readily, takes a good polish, and wavy-grained forms which are common are especially desirable for imitation mahogany furniture. While it is principally employed for furniture it is also used for handles, interior work, fixtures, pulleys, saddles, musical instruments and firewood. It should be adapted to the same uses as eastern red maple, but because of its scattered occurrence and rather poor form, commercial quantities of clear, sound material of good sizes are difficult to obtain.

Red alder (*Alnus oregona*) is the only important alder in the United States, although fifteen different species are recognized by botanists. It is distinctly a tree of moist situations and grows chiefly along streams, near springs, in river bottoms and on particularly well-watered slopes. While its botanical range extends from southeastern Alaska to Los Angeles county, California, it reaches its best development in Washington and Oregon. Its usual size in these two states is from fifty to seventy-five feet high and from a foot to a foot and a half in diameter, sometimes much larger. In form it is usually straight, fairly cylindrical, and free of branches for at least twenty-five or thirty feet.

The color of the wood is light brown tinged with red. The wood is light, rather soft, fairly strong, brittle, fine-textured, works easily and takes an excellent polish. It turns and glues well and does not shrink or check badly. When finished it resembles cherry, making it a desirable cabinet wood. It is used also for broom handles, pack saddles, interior finish, pulleys, moldings, columns, piling and fuel. Although suited for other purposes the tree has little future, as it is an incidental species on soils which are either adapted to better forest trees or are suitable for agriculture.

Western chinquapin (*Castanopsis chrysophylla*) or as it is more commonly called simply "chinquapin" is one of two trees on the Pacific coast which are intermediate between chestnut and oak. This tree favors the chestnut mostly while the other, the tanbark oak, is mostly oak. Western chinquapin occurs on mountain

slopes, sheltered ravines and valleys, and in rather dry or very dry rocky and gravelly soils from southwestern Washington to southern California. It is largest in valleys in northwest California, being small or shrubby in dense pure-growth thickets over large areas elsewhere of its range. While sometimes a very large tree is found, ordinarily it is from thirty to fifty feet high and from eight to fifteen inches in diameter in the region best suited to it. It has thick, evergreen leaves, and bears a small bur like a chestnut.

The wood is pale reddish brown in color, light, rather soft, fine-textured, stiff but not strong, somewhat brittle, works easily. It is odorless and tasteless, though the tannin contained is somewhat astringent. Unlike chestnut the pores in the springwood of the growth rings are few, small, usually round or nearly so, and rather widely separated in a single row. There is little about the appearance or structure of the wood that resembles oak as all the rays are very fine and the pores small. The radial lines of pores in the summerwood and the presence of wood parenchyma in fine tangential lines is like both chestnut and oak. Large trees furnish excellent saw timber suitable for agricultural implements, certain grades of furniture, and miscellaneous purposes.

Tanbark oak (*Quercus densiflora* or *Pasania densiflora*) occurs from northern Oregon through the cascades and coast ranges and west slopes of the Sierras to the mountains of southern California. It reaches its greatest size and is most abundant in the redwood forests of California, though nowhere does it form more than a small part of the stand. The average size of mature trees under fair conditions is between seventy and eighty feet high and from two to three feet in diameter, though it is occasionally much larger. It is economically the most important of the sixteen Pacific coast oaks, not on account of its wood but because it furnishes the chief material used in the extensive tanning industry of that region. Fully a million cords of the bark worth \$18,000,000 have been used in the last sixty years in California in the manufacture of heavy leather. The wood of the tanbark oak is usually allowed to rot in the ground after the bark is removed. There are a great many purposes for which the hard, heavy material can be employed, such as flooring, wagon and ear stock, and possibly cooperage. It makes excellent fuel.

Oregon oak (*Quercus garryana*), known most commonly as "white oak," is the largest oak in the Pacific coast region and the most valuable for its wood. It occurs mostly in alluvial high bottoms, valleys and prairies, from Vancouver Island southward through western Washington and Oregon into central California. It is the only oak in the Pacific coast of Canada. It is usually a medium sized tree with a short, clear trunk and a broad, round-topped crown, growing only in open mixture. The wood is yellowish brown, very hard, rather coarse-textured, strong, rather tough and durable. It is similar in quality to that of eastern white oak. Its principal uses are handles, furniture, cooperage, saddles and stirrups, boats, vehicles, interior work, fixtures, baskets, fence posts and fuel. About 2,000,000 board feet is consumed annually in Oregon, an equal amount in California for tanks and pipes, and 200,000 feet in Washington.

California laurel, Oregon myrtle or pepperwood (*Umbrellaria californica*) is an evergreen rather closely related to the camphor and bay trees of the Old World and the well-known sassafras of the eastern United States. Its range is from southwestern Oregon, where it is largest, to the southern border of California. It is variable in size and shape according to the site, but under favorable conditions makes a large tree of good timber form, but of limited occurrence.

The wood is of a rich yellowish-brown color, often beautifully mottled. The color can be improved and blackened by soaking the green and unseasoned logs in water. The wood is moderately heavy, hard, very firm, fine-textured, takes a high polish and fine finish. It is an excellent cabinet wood surpassed by none of our native hardwoods. Only the small supply limits its extended use for furniture, cabinets, mantels and novelties. Only a little over 5,000 board feet of the wood was reported consumed in one year by the wood-working industries of the Pacific coast.

Traffic Matters Around Memphis

It is definitely learned that practically all the railroads which joined in announcing an advance in rates of from two to six cents per hundred pounds on shipments of hardwood lumber and lumber products from producing points in the South Canadian destinations are preparing to file supplemental tariffs with the Interstate Commerce Commission, cancelling these advances. Officials of the Southern Hardwood Traffic Bureau, which has the matter in hand, are somewhat reticent about discussing the subject. It is known, however, that the railroads are filing such supplemental tariffs and it is expected that definite announcement will be made within the next few days to this effect by the Interstate Commerce Commission. The lumbermen appeared before the commission at St. Louis and Cincinnati and presented strong evidence against the proposed advance. The railroads are evidently of the opinion that the commission will decide against them and this is believed to be the reason for their course. While lumber interests feel confident that the railroads are preparing to cancel these increases, there is a feeling that it will be much better to let the commission reach a decision, as a favorable verdict from that tribunal will be a big factor in future fights with the railroads over these advances. It is therefore not surprising that lumber interests here are not altogether overjoyed by the fact that the railroads are on the eve of cancelling the advance in question.

The case of the Anderson-Tully Company, brought before the Interstate Commerce Commission for the purpose of securing an order forcing the lines west of the Mississippi river to issue through bills

of lading on export shipments of lumber, will be heard in New Orleans, February 27. George D. Burgess and J. H. Townsend, president and general manager, respectively, of the Southern Hardwood Traffic Bureau, F. B. Robertson of the Anderson-Tully Company, and other prominent exporters of Memphis and the western territory will attend this hearing and present evidence favorable to their contention. All of the roads west of the Mississippi river, with the exception of the Southern Pacific, have announced that they will issue through bills of lading on export shipments of lumber after March 3. The Southern Hardwood Traffic Bureau, however, is very anxious to have a pronouncement from the commission as to its authority over the carriers with respect to the issuance of through bills of lading and the officials of this organization are pushing the case to a completion in order that they may have a ruling from that body on this very important point. They believe it will mean a good deal to them in future dealings with the common carriers.

There will be a hearing at St. Louis early in March, covering the proposed increase on hardwood lumber shipment from points in Arkansas and Louisiana to Missouri, Kansas and Nebraska and the advance of two cents per hundred pounds on hardwood lumber shipments from Arkansas and Louisiana to Memphis and from Memphis and Mississippi points to New Orleans. This hearing at St. Louis will be followed several days later by a similar one at Memphis. These cases are in charge of the Southern Hardwood Traffic Bureau and there will be a number of lumbermen to appear before the commission at St. Louis, as well as at this point.

Introducing New Woods

The difficulty in making a new wood known and appreciated as an article of commerce, arises chiefly from the neglect when sent for trial from abroad. If small specimens are sent the wood is often pronounced to be of little value, because unknown in the market. The importer is sometimes advised to send the wood in larger quantities to market for a few years, as it will then have a chance of being tested and its true value more satisfactorily determined. The shipper is not often inclined to follow this advice. If he does send a quantity sufficiently large to be tried for manufacturing purposes, it is sometimes not brought to the notice of wood users. The timber is necessarily consigned by the exploiter to the agent of a steamship company, who transfers it to a broker by whom it is sold often with very little information respecting its properties, or the quantities in which, and the prices at which, it could be supplied, if it should happen to be available for a special purpose. The novelty of the appearance, or the strangeness of the name, is more often the subject of jest, than the wood is one of serious inquiry. As a general thing, the result is that the wood is sold at a price which does not pay the expenses of putting it on the market, and the promoter is invariably deterred from sending any more material. The exploitation of a very good wood is often stopped in this way.

The difficulties in bringing a new wood into use in sufficiently large quantities to be an article of commerce are usually very great. The promoter is, moreover, while the value of the new wood is unknown, subjected to the inconvenience of not having advances made at the place of shipment upon the timber he is shipping, as is the case with the well-known woods with a market value. Shipping agents are often reluctant to export a new timber under a strange name. It is on this account very often that new woods are shipped to market under the comprehensive name of mahogany or cedar, which have an established market.

There are a number of large wood users who inquire after new foreign woods likely to be useful in their special businesses, and

who, having obtained them, first make a scientific investigation of the mechanical and physical properties. After the species have been subjected to the practical working of the factory and found to be suitable, the manufacturer often secures a concession or buys large tracts of such timberlands and exploits it according to his needs. A manufacturer may justly object to employing a new wood with the properties of which he is only partially acquainted; and of which having investigated, he has no information as to the quantities or price at which it can be supplied, in the event that he finds it suitable for his purposes. Unless obtainable in quantity, regularly and at reasonable prices, he considers it inadvisable to use it. Therefore, in sending a new wood to market, it is very important that it should be accompanied with the necessary statistical information. The shipper should be in a position to keep up a regular supply for such manufacturers as have consented to employ it. Information, therefore, both of a practical and of a scientific nature, is essential for bringing new or little known timbers into use.

Ash Imitated by Pine

From Dr. C. A. Schenek, Darmstadt, Germany, the European headquarters of the Biltmore Forest School, comes a sample of Idaho white pine finished in imitation of ash, which, to say the least of it, is unique. The process appears to be somewhat similar to the "sugi" method supposed to have originated in Japan. The wood is rubbed with a steel brush, lengthwise with the grain, and the soft summerwood of the annual rings is thus worn down slightly below the general surface, producing the ash or oak effect. The imitation is completed by applying stains and fillers to give the desired color.

The process ought to prove successful with any wood of fairly wide rings in which the difference between the springwood and summerwood is well accentuated. The springwood is softer and is worn down more rapidly than the summerwood. Fir and hemlock should yield readily to the treatment. Steel brushes such as orchardists use in cleaning the bark of trees can be used.

Handling and Assorting Logs at Mill

Lumber manufacturers, notably those handling a variety of hardwood timber, know the essential value of being able to saw one kind of logs at a time and not being obliged to produce lumber indiscriminately from a half dozen or more varieties. In sawing timber the expert knows that to obtain the best results each kind of wood requires a slightly different hook of the saw teeth, and perhaps a little different swage and set, and that, to accomplish the best results, one kind of wood should be manufactured at a time.

It is impractical to assort logs in the woods, and equally so when loading onto cars or barges, or in rafting. Hence the only logical place to assort logs is at the mill. On the front cover of this issue of *HARDWOOD RECORD* is illustrated the Fitzgibbons & Krebs patent traveling derrick, which is a self-contained elevated derrick traveling on its own track and propelled by its own power. The gauge of the track, twenty-eight feet, is wide enough so that a boom pole up to seventy feet in length may be used. No guide wires are necessary. The hoisting engine which the machine contains transmits the power to the rear sets of trucks, which propels the machine backwards or forwards. The derrick track lies parallel with the railroad log switch so that the machine can travel quickly from one car to another while unloading, instead of dropping every car of logs to the machine, as is necessary when using a stationary derrick. The track is also parallel with the log haul-up to the mill. The derrick tracks are usually placed half way between the log switch and the log haul-up, and a log yard one hundred feet wide and as long as conditions will permit may be employed. The derrick track may be made to span the log haul-up with log car tracks on each side if desired, or the derrick track may straddle the jack-slip from a log pond.

By the use of this apparatus, it is not only easy to assort logs and pile them up in skidways for convenient use, but also to turn the logs so that the top end may first enter the mill. Every practical sawyer knows that a saw will stand better feed and do better work when entering the log at the top, or small end, than it will if entering at the butt, or tough end. When the log goes into the mill with the small end to the saw, the boards go to the edger with the narrow end to the edger saws. With this advantage, the edgerman can place his saws exactly right and can edge a board to its extreme width without waste. It is practical for the edgerman to make the saw strike exactly on the bark line, or both edges, at the narrow end on plain sawed stock, or on the bark and the beveled edges on the quarter-sawed stock. This method of always delivering the small end of the log to the saw effects a considerable saving each day, as one inch, or even a fraction of an inch, loss on one good, plain board may mean the loss of five cents, and on a quarter-sawed oak board may mean from seven to ten cents. So the use of this log derrick will effect a minimum saving on this one feature alone to more than pay the cost of its operation.

By the use of the apparatus, logs may be sorted in the log yard, keeping different kinds of timber separated or assorted for grade of logs. The resulting system in lumber manufacture is also a great advantage on the lumber sorting slip, as lumber of one kind can be sorted more accurately for thickness, length and grade with fewer men than when a half dozen or more kinds of lumber are coming through the mill at one time. It also simplifies the trucking of lumber to the yard. This machine has unloaded and stacked thirty-six cars of hardwood logs, 160,000 feet, in ten hours and at the same time supplied the mill with 40,000 feet of logs, making a total handling of 200,000 feet in ten hours. This work was done at a labor cost of seven dollars, or three and a half cents per thousand feet, the crew consisting of one derrick operator and three laborers. A log containing 1,000 feet or 2,000 feet is handled just as easily as the smallest log. By means of this system and on account of the rapidity with which log cars can be unloaded, the lumberman has no dread of a failure in car

service. The railroad's equipment is quickly turned back to it, and a stock of logs can, at all times, be kept conveniently at hand in surplus supply, and expensive shut-downs be avoided.

The cost of these machines is from \$3,000 to \$4,000. The machine itself is of home construction, made on the ground. The patentees furnish complete plans and detail prints, so that any millwright can erect the apparatus, the construction being practically all straight woodwork, and very simple. A full list of timbers, bolts, washers, etc., is furnished, so that the actual cost can be readily figured. At the present time this derrick is being used by the Wood-Mosaic Company at its New Albany, Ind., plant; by the Green River Lumber Company, Memphis; Nickey Brothers Hardwood Lumber Company, Memphis; Nickey & Sons Company, Memphis; R. J. Darnell, Inc., Memphis; Memphis Veneer & Lumber Company, Memphis; McLean Hardwood Lumber Company, Memphis; Wisconsin Mill & Lumber Company, Huttig, Ark.; McLean Lumber Company, Chattanooga, Tenn.; McLean Lumber Company, Birmingham, Ala.; J. F. McIntyre & Sons, Inc., Pine Bluff, Ark.; and (in course of construction) by the Saline River Hardwood Company, Pine Bluff, Ark. The first of these apparatus was built nine years ago and is still giving as good service as when first installed.

The cover illustration and this text is published in *HARDWOOD RECORD* not as an advertisement but as an educational feature to assist in the development of what is regarded as an excellent method of log handling and assorting and one which spells higher efficiency and lessening cost in log handling. At the same time, in deference to the owners of the patents of this apparatus, it is glad to advise that further information on the subject can be obtained by addressing O. M. Krebs, Memphis, Tenn., Mallory Branch.

Lumbering in the Bahamas

It does not take the British government a year or more as it does the Bureau of the Census and the Forest Service in the United States to make a census report on the lumber industry of the Bahamas. In fact, it is a very short and painless operation both to the government and to the producers since there is only one operation which can be so dignified by the designation of operation. On the little island of Abaco, one of the most northerly group of the Bahamas, is a modern sawmill plant which, as might be guessed, is backed by American capital and in charge of lumbermen schooled in the States. The mill cut during 1912 a total of 12,757,986 feet of timber of which amount 11,491,131 feet was shipped from the island to Cuba.

The plant of the company is located at a town called Wilson, on the east coast of Abaco Island, where a very fair harbor exists. The population of the place is close to 500 and practically all the business of the town is dependent upon the operation of the lumber company.

The timber of Abaco Island is reported to be largely Cuban pine (*Pinus caribaea*), and not long-leaf (*Pinus palustris*). Cuban pine also is known variously in Alabama, Mississippi, Georgia and Florida as slash pine, swamp pine, bastard pine, meadow pine, pitch pine, she pitch pine, she pine and spruce pine. Its distribution is in the coast region of South Carolina southward over the coast plain to the Keys of southern Florida and along the Gulf coast to the valley of the Pearl river, Louisiana; common on the Bahamas, on the Isle of Pines, and on the highlands of Central America. The wood is heavy, exceedingly hard, very strong, durable, coarse grained, rich dark orange color, with thick nearly white sapwood.

Not only does the Abaco Island operation turn out lumber but an ice making plant is operated in conjunction. And as is the case with the lumber produced, the company has an excellent market for its ice. The plant supplies practically all of the ice used in the Bahama Islands and the warm season is twelve months long. Ice retails on the island for one cent a pound in contrast with thirty cents a hundred pounds in Chicago.

The Truth About Catalpa

Probably no other tree has been so generally recommended for planting throughout the Middle West as the hardy catalpa. Probably, too, only one other tree (eucalyptus) is suffering so much from indiscriminate praise of over-zealous friends, and unscrupulous promoters. Many of the plantations that are fifteen years of age or older have made good financial returns, but a large number have scarcely paid for the cost of their establishment and maintenance; still others have been complete failures. The failure to get good results is usually accounted for by concluding that the wrong kind of catalpa was planted. While such a conclusion is often true, more often unfavorable situations and lack of proper treatment are responsible.

It has long been recognized that only the true strain of hardy catalpa (*Catalpa speciosa*) is fit to plant. The ordinary form (*Catalpa catalpa*) so common as a shade tree, and the Japanese variety (*Catalpa kempferii*) are worthless for anything but decorative purposes. The species apparently hybridize so that even though seeds are collected from the right tree the resulting seedlings may be mongrels. Catalpa seeds and seedlings look so much alike that often an expert is fooled and only time can correctly answer the question by showing the character of the trees.

The hardy catalpa is exacting in its demands upon the soil. The land for its best development is such as will produce a good corn crop. It will not make a satisfactory growth in gumbo, sterile, poorly drained, or high, dry soils. The use of good corn land for such purposes is hardly a sound policy. The proper lands for growing timber are those not well

A SPLENDID SPECIMEN OF HARDY CATALPA GROWING NATURALLY IN EASTERN ARKANSAS.

suited for agricultural or similar pursuits. Exceptions are found in the case of windbreaks where strips of good land may profitably be devoted to trees because of the beneficial results to the protected fields. The catalpa, however, is not a very good tree for this purpose, but is well adapted for planting on creek and river-valley lands subject to inundation. Occasional floodings of short duration do not injure the trees unless their tops are submerged which would probably occur only during the first or second year after planting.

About the only uses for which catalpa is suited are posts and poles. It is too soft for railroad ties even if they could be produced in a short time, which is impossible. In treeless states it is prized for fuel but only because harder woods are not available. If the trees were of sufficient size they would make excellent lumber for use where strength is not required. The wood is light, soft, porous, not strong, easy to work and noted for its resistance to decay. There is good reason to believe, however, that the durability of rapidly grown young timber such as most planters desire to obtain is greatly overestimated.

So few people have seen forest-grown specimens of the tree that it is not generally known that it sometimes reaches large proportions. In the rich bottom lands of the lower Ohio and Wabash valleys and along the Mississippi occasional individual trees six feet in diameter and over a hundred feet high greeted the early lumberman but have long since disappeared. There are, however, some good specimens of smaller size still standing.

It is not to be inferred from the

YARD CONTAINING 60,000 POSTS AND 650 RICKS OF WOOD CUT FROM TWENTY ACRES OF SIXTEEN-YEAR-OLD HARDY CATALPAS.

preceeding that the catalpa has no redeeming features. It has, but they have been so over emphasized that a word of caution seems desirable. In some parts of the country nursery firms are sending out smooth-tongued agents selling catalpa seedlings at \$20 to \$25 per thousand. This is from four to ten times their actual value for they are the most easily grown of all tree seedlings. Seed true to name can be procured from reliable dealers very cheaply and the

plants can be grown with the same ease as radishes. Since the cost of the planting stock (which must be computed at compound interest for from twelve to twenty years) is often the principal factor in determining the financial success or failure of the plantation it deserves very careful consideration. The catalpa is all right in its place but its greatest financial returns so far have inured to nursery-men and unscrupulous promoters.

Co-Operation and Sales Efficiency

Modern methods of business show some startling revelations compared with those of olden days and are especially marked in the case of some of our concerns of national reputation. In former years a product was made and sold to whomever would buy. As time wore on, transportation facilities increased and made accessible much broader markets. As a result manufacturing establishments have had to increase capacity until now production is the most enormous we have ever known. As transportation facilities have increased, so has each step in the process of manufacturing been more closely analyzed. Now, with production at top-notch, steps are being taken by the employment of efficiency engineers to add from a quarter to a half more with the same investment, same number of men and the same expense, by simply applying a new and modern method of handling men, work and machines. It is simply a sign of the times, or in other words, progress.

Aside from all other problems of importance that the large manufacturer has to deal with, the most important today are those of organization and sales efficiency. Modern methods of merchandising practiced by some of the largest concerns are worthy of emulation by the lumber business. It is said that we are all too close to our own business to see the defects therein and in this case an outsider is more capable of telling us of defects in our methods, or of indicating where we are losing money. In general, it is safe to say that one cannot get many new ideas in merchandising lumber from the lumber industry—he must watch the methods of some manufacturer or merchant in an entirely different line of business. There it is always possible to get points that can be applied to advantage in merchandising lumber. This has already been done by one or two lumber concerns, as some of the following examples will show.

In past days we all attended to our own affairs and didn't worry about what was happening to the other fellow. Consequently there were all sorts of conditions that were detrimental to all. Today there is everywhere a spirit of co-operation. We have meetings of manufacturers, of jobbers, and of retailers, who confer with one another to effect an uplift of business in general because it is recognized that each receives his share of benefit thereby. We meet and discuss different problems, exchange ideas and each probably gets points that are applicable to his business. But how many really carry the spirit of co-operation back with them to apply in their own concerns? Probably very few.

How about the spirit of co-operation as between you and your salesmen and office force? Have you a perfect organization? Do you realize that your office boy and your salesmen are factors or cogs in the wheels of your organization just as you are yourself? By using the spirit of co-operation you can swing a disorganized mass, each individual of which is pulling in a different direction, into line, and thereby secure the maximum efficiency.

To illustrate: One of our largest manufacturers—not a lumber manufacturer by the way—gave his annual dinner recently and as usual, called in all his salesmen, some of whom had to journey from the Pacific coast. He also had present all of his office force, superintendents, foremen and heads of each department even down to the department of shipping and inspecting; in fact, his entire organization. I met the sales manager recently and in part he said, "After the dinner there were talks by the heads of each department on the products of this concern. Next day we all went through the plant and the superintendent and the heads of each department

explained in detail each process and also the new methods put in since the last yearly meeting. It's a good thing, I think, once a year to have everyone refresh his knowledge of the manufacturing end no matter how well he knows it. In the afternoon we held an open meeting. The salesmen brought up new selling ideas as well as new objections that they had to fight against. The advertising men got many new pointers and the advertising manager outlined the plan of campaign for the coming year. The superintendent learned of some defective points in the manufacturing end by hearing the salesmen talk. He in turn, made some suggestions in the selling end. Each man got up and said something and each went away fired up with enthusiasm and a determination to go in and work his hardest. The men who had won the money prizes for the best records went away determined to eclipse their former records."

There you have the spirit of co-operation and one by one you see concerns of national reputation adopting this method because it means increased business, an improved product and the welding of the whole concern into one unit.

This dinner idea is a good one. I believe Andrew Carnegie was one of the first to adopt it. Each week he would set aside a night for the dinner and have all his heads of departments discuss the various problems of manufacture. In this way he secured the active interest which brought out many ideas that perfected his methods and brought him success. I know also of one lumber manufacturer who carries out this idea. He has even the sawyer and the filer at this dinner. In fact, it is said that many of the suggestions of the sawyer and of the chief inspector find use in the sales-department and vice-versa.

I heard recently from one of our largest lumber operators enjoying the co-operative spirit. This concern used to be one of the easy-going kind and I was so interested in hearing the man who owned it tell about it, that I made the trip purposely to see how it was working out. The operation was mammoth. As far, seemingly, as the eye could reach, there was lumber—millions and millions of feet. The minute I got off the train I was conscious of a feeling of power, speed and purpose. It seemed in the very air. Two western lumber manufacturers were with me, one of whom after going through the mill and finally meeting the superintendent—a man of about twenty-five—exclaimed, "Dog-goned if it don't look like the place is run by kids" which remark, although ungrammatical, nevertheless expresses a fact. There is hardly a man over twenty-eight and there are some that are but twenty-two, but the mill pays the best wages of any in the section. In the morning, before work starts, there are about twenty men applying for jobs. It's the most popular mill in the South. There's the first point in co-operation—they pay good wages. Now let's see how it works out.

The whistle blows at 6 a. m., but the engineer wanders in about 5:30 and starts the engine going about 5:40, and by 5:50 the mill is going full tilt, every man at his place working to full capacity. When the whistle blows at noon or night, there's no mad rush to get away. Sometimes the mill runs five or ten minutes after. What is the secret? Interest! And interest is co-operation. The men's quarters are good; their food is plain but good, and they're the healthiest crowd I ever saw. The concern does everything to make the men contented. Even the drinking water is tested frequently. When the men see the interest that is manifested in them, that interest is reflected back in their work.

You never saw such a busy mill in your life. The boards just keep shooting out of the mill and everyone is "on the run." Four mules and drivers take the lumber from the sorting shed to the piles. When a team comes back for another load, it comes back on the run. Efficiency?—It would do you all good to see this plant. Every man plays team work with the other fellow. Honestly, the whole outfit looked more to me like a college team with all its spirit and enthusiasm, than an industrial organization.

When a new step is to be made, the heads of the concern, the under managers, the superintendents and chief of inspectors, get together and discuss the problems. By getting the benefit of each man's ideas a plan is shortly whipped into shape. And a plan made up of the ideas of several is generally better and less vulnerable than one formulated in only one mind.

In talking with another sales manager recently, I was much surprised to find him using the "preminm method" with the salesmen. "Yes," said he, "and it pays. We first figured it out on the basis of each man's former record and then we set the mark quite a little above them. The contest closed the end of the year—this is the first year we tried it—and one of the boys got a check for eleven hundred dollars, the first prize. The check was handed out graciously because the man had earned it. The concern did a much larger volume of business over the former record and that check represented only a small part of the profit. This may seem a lot of money for a concern to hand out to a man but the trouble with most concerns is that they are too short-sighted; they hate to give away, as they call it, any extra money. They lose sight of the fact that they are doing a larger volume of business and therefore making extra profits on the same expense.

"The way I size up a selling organization," this sales manager continued, "is that it is a team. I bring my 'team' in several times a year and we talk everything over. The salesmen criticise me and I jump on them. Then we make suggestions, adopt the good ones, cut out the obsolete methods, learn the best selling points and how to use them as points of attack. Each man has ideas and this is the way we all get the good of them. They were especially enthusiastic over the idea of a contest when one of the men suggested it, and they have all worked hard. You know, salesmen are just boys grown up and must be kept interested. Under all conditions a salesman wants to be bright, cheerful and optimistic, and when he feels that he has a good and an appreciative organization behind him, he has no trouble to be so."

There is a splendid example of organization and sales efficiency and yet the idea came from an entirely different line of business. I still claim that you have to go outside of the lumber business to get modern ideas. Here is another example of the trend of the times—yet if you put the same proposition to many millmen, they will say it cannot be done. A very large manufacturer of lumber recently put on salesmen in the different sections. He formerly sold entirely through wholesalers and yet he didn't want to lose his wholesale trade. So he made a price arrangement whereby the wholesaler was quoted a special price and much below that which his salesman had. Not one of his salesmen, however, knows to what wholesalers the concern is selling, and of course, is not allowed to call on the wholesale trade. They also have instructions that in the case they recognize a car of the mill's stock that was sold by a wholesaler, to simply commend the stock as if it were a competitor's.

The business of this concern has doubled; in fact, it says that very shortly it will be almost three times as great as in former years. The head of this concern has kept step with modern times and methods. He realizes the value of the legitimate wholesaler and that his class will always remain in business. He makes the difference in price, knowing that his cost of selling the wholesaler by letter is much less per thousand feet than by selling through his salesmen to the consuming trade.

The mill-to-consumer idea that most of the mills seem after may work well in good times and good markets, but just watch those very mills fly to the wholesalers in dull or panicky times. These mills can't watch credit from afar and they know that the average

wholesaler is good for what he buys. The man referred to above has the advantage for he can call off his salesmen at any time and yet have his wholesale trade.

The mill-to-consumer idea is splendid in the lines of trade-marked goods, but except in the case of the large national concerns such as the National Biscuit Company, National Cash Register Company, etc., that have enormous capital to effect economic distribution, the wholesaler in his respective city is relied upon to effect distribution. Where the price of an article is standard and advertised, the wholesalers have their profits dictated by the manufacturer, but in almost every case the profit is a fair one.

H. E. S.

Timber Cutting and Moon Phases

During the last few months newspapers have revived the well-worn tale that wood cut during the crescent of the moon does not last as long as that felled during the wane, and especially from the last quarter to two or three days before the new moon. It is believed by many that timber felled after the new moon and until after the full of the moon, splits more freely and does not possess the durability of timber cut at another time. A good many farmers are still influenced by this belief and pay special attention to the phases of the moon when they wish to prepare fence posts or structural timbers which are to be placed in contact with the soil. They consider that fence posts cut during the wane of the moon preserve all their best qualities.

While it is well known that timber cut in spring and summer is not as durable as that cut in winter, when the life processes of the trees are less active, no one has yet been able to produce a scientific explanation in support of the popular opinion that the phases of the moon exercise a marked influence on the durability of the wood cut at different periods.

It was also considered that this influence of the moon is much stronger in the tropics than it is in the temperate zones, but as a result of experiments conducted on the island of Trinidad, just off the coast of Venezuela in South America, a few years ago the theory was finally rejected as one having no foundation of fact.

While this opinion respecting the influence of the moon on the quality of the felled timber has already been the subject of much and varied discussion, it has never appeared reasonable enough to the intelligent wood users in this country to induce them to conduct a careful experiment. It is evident that if this matter were not free from doubt the railroads in this country, which use over a hundred million crossties annually, would look into it very critically. It is, however, certain that no such lunar influence exists and that the proposal to fell a tree during a certain quarter of the moon as a panacea against decay is entirely chimerical.

Car Statistics February 15

The statement of car surpluses and shortages issued by the American Railway Association under date of February 21, showing car conditions on February 15 establishes the fact that there has been an increased shortage and a decrease in surplus from February 1 to February 15. Figures show a total surplus February 15, 1913, of 52,700 cars, and a total shortage of 30,517 cars.

On February 1, 1913, the surplus was 62,045 cars and the shortage 24,785 cars. A year ago, specifically February 14, 1912, there was a total surplus noted of 50,886 cars and a shortage of 36,928 cars.

There are ten groups listed, each group having reports from the number of railroads comprising it. For instance, the New England group made up of reports from eight roads showed surplus of 1,334 cars and a shortage of 484 cars. The Virginia, West Virginia, North and South Carolinas group embracing thirty-two roads, showed a surplus of 10,450 cars and a shortage of 4,232 cars. The Kentucky, Tennessee, Mississippi, Alabama, Georgia, and Florida group containing reports from forty-seven roads showed a surplus of 1,189 cars, and a shortage of 3,714 cars. The New York, New Jersey, Delaware, Maryland and eastern Pennsylvania route having reports from fifty-nine roads showed a surplus of 5,887 cars, and a shortage of 2,141 cars.

In the Lair of the Eucalypts

This publication has contained several articles within the last few years deprecating the alluring statements being made by sundry promoters of eucalyptus growing land schemes in southern California. It now wishes to reiterate and emphasize all the statements it has hitherto made on this subject, and to further advise investors that the claims of the wonderful profits possible of attainment in eucalyptus growing are absolutely chimerical. There is not one chance in a thousand of attaining a fairly good profit out of an investment in these projects. They are schemes, pure and simple, to separate the amateur investor from his money.

When and how the commencement of eucalyptus planting in southern California transpired is not a matter of accurate history. Various types of eucalyptus, largely blue gum, were brought over from Australia and planted thirty to fifty years ago. By reason of its comparatively rapid growth it was planted by ranchmen along the edges of fields to form windbreaks, which before the advent of comprehensive irrigation systems were regarded necessary to insure anything like satisfactory crops, either of grain or fruit. These rows of trees about immense fields in that region have grown in many instances to trees of considerable size.

To be sure, they are short-bodied, scraggly, and ill-smelling trees, generally twisted in bole, and probably are the most unbeautiful that were ever devised by the Almighty. The center picture on this page shows what is probably as good a specimen of eucalyptus as grows in the entire country, but this is an exceptional tree.

The picture at the left shows some of the growth thirty or forty years old, planted as windbreaks, and the picture at the right shows long lines of these lumpy, scraggly trees on either side of a roadway.

The average ranchman of southern California is now apparently just as desirous of getting rid of eucalyptus as he was originally to secure it. These men have found that eucalyptus exhausts the soil for fully forty feet on each side of the line of these windbreaks, and thus renders it impossible to grow anything within that distance from them. Among these people eucalyptus is popularly known as the "thief-tree"—stealing as it does all the nutriment of the soil for many feet about it.

There is one Los Angeles company, recognizing

this situation, that has purchased a quantity of eucalyptus windbreaks from ranchmen to an alleged extent of ten million feet, within a comparatively limited area, and is sawing the wood into squares and from it producing handles and wagon stock in a considerable quantity. This company alleges that it is getting good financial results from its enterprise, and its handles, spokes, etc., certainly have the appearance of being a very good commercial output. In view of the absolute paucity of hardwoods on the Pacific coast it would not be surprising if a local trade could be built up out of these eucalyptus products for the purposes named, that would be fairly remunerative, although it is doubtful if the wood has equal merits to hickory.

There is also a legend that one other man in southern California has made some money from the manufacture of eucalyptus into lumber and veneers. Outside of these two enterprises, and such of the wood that has been employed to a limited extent for railroad ties, and such as is being used for fence posts and cordwood, these constitute the entire commercial history of the wood in utilization in the entire California country.

The Santa Fe Railroad and quite a number of individuals have during the past few years planted comparatively small areas of eucalyptus, but from an examination of these wood lots, the writer wishes to assert that they are the most unpromising exhibition of practical forestry that he has ever seen. It is just possible, by proper thinning, that within thirty to fifty years a growth of eucalyptus could be accomplished that might have some little possible value for lumber and railroad tie purposes, but it is extremely doubtful if the wood has any essential value save for fuel purposes.

Again, it is perfectly safe to allege that any California land that will grow eucalyptus will produce ten to one as much revenue if it were planted to any of a dozen varieties of field or citrus crops.

As a tree-growing proposition, eucalyptus is a gigantic fake, and is unknown as a commercial proposition in California. It is heard of only east of the Mississippi river, where unscrupulous promoters are attempting to rob the public on these fake eucalyptus growing land sales.

To quote a letter from one of the two eucalyptus

utilizing companies: "It is a fact that some over-optimistic and unscrupulous land promoters have over-estimated the earnings or profits to be derived through the purchase of land planted to eucalyptus. * * * Frankly will say to you that from practical experience we have demonstrated beyond any question of a doubt that there is as little, or less, waste in the sawing of eucalyptus and converting it into a finished product as there is to any other hardwoods. We know absolutely we can have made, or make them ourselves, various articles from eucalyptus in long lengths and various sizes for general blacksmithing and wagon work, and where the consumers have been supplied with this wood it has been demonstrated it is superior to any other hardwood used for similar purposes.

"Further, we have successfully made veneering, and anybody who has seen this wood finished and dried in a thorough and workmanlike manner cannot say other than it takes a very high and beautiful polish with a grain that is handsome, and that the wood is serviceable. I would add further that furniture manufacturers who have had experience with eucalyptus veneering have approved of it, and are

today ready and willing to give us orders for veneering provided only that a positive assurance can be given that an adequate and continuous supply can be had."

While not having as high an appreciation of eucalyptus as the writer of the foregoing, it is only just to quote his opinion.

A well-versed lumberman who has spent a good many years in California, makes this deduction of the eucalyptus proposition:

"Regarding the eucalyptus proposition will say that I do not think much of it. In the first place there is not enough timber growing to attempt to create a demand, for any great quantities could not be furnished. The timber standing today is only an accident as it was planted for windbreaks and not for the purpose of filling 'a long felt want,' with the expectation of being used as a substitute for hardwoods. It is all tommy-rot about the immense profits to be derived by planting them. Any well posted and truthful individual will admit that it takes from thirty to fifty years for trees to become of commercial value. The soil cultivated for any other purpose would yield much greater returns. Therefore, in my opinion this game is only a crazy man's dream."

A Pointer on Selling by Width

The increasing popularity of the system of selling hardwood lumber according to width, in order that the customer may be able to buy stock that will require the minimum amount of working in his factory, has developed a number of wrinkles that the lumberman has need to look out for in handling the business.

The necessity of pricing this stock in such a way that the increased expense of handling will be taken care of, along with a proper charge for the extra service performed in separating the various widths, is well understood. The customer is perfectly willing, as a rule, to pay the added price, knowing that he is getting it at a figure which is a good deal less than the expense of working random widths would involve. So this feature of the situation is all right, from all standpoints.

In the actual measurement of lumber sold on this basis, however, there are occasional troubles which are likely to be overlooked by the dealer who has not given special study to the details of handling this trade. In measuring according to widths the 12-foot scale is of course used. The inspector who tallies the lumber, unless he has received special instructions in this connection, is likely to follow the usual system, and "call up" widths which are over the half-inch mark, as well as "call back" those which are under it. In the usual system of measurement this is a satisfactory method of equalizing irregularities of width, and the force of habit is sufficiently strong to result in the same plan being used when lumber is being loaded according to width, unless the inspector is apprised of the impracticability of using this plan.

In order to dispose of the question satisfactorily, the only safe plan is to use the minimum width all the way through. If 7-inch widths are being picked out, only boards which are a full 7 inches in width, or over, can be used. These which are $6\frac{1}{2}$ or $6\frac{3}{4}$ inches, and would ordinarily be tallied as 7-inch boards, must be thrown out, as far as that particular item is concerned, while if the same customer is buying lumber 6 inches wide, they can, of course, be used in that connection.

The obvious objection to this plan is that the buyer gets all the better of it. He gets the benefit of all the "breaks," since the seller cannot equalize them by giving himself the increased measurement on the "overs," as he does in the case of most shipments. The customer gets as 6-inch lumber all the boards that are 6 inches and over in width, and pays for 7-inch stock on the basis of all the boards that are between 7 and 8 inches in width.

Those who have not given this question attention may be inclined to discount its importance and to estimate the footage involved in a car as too small to worry about. That this impression is not correct was borne out by a recent experience of a hardwood concern in an Ohio

valley city. A carload of thin quartered oak of a given width was shipped to a New England chair manufacturing concern. The inspector who loaded the lumber was a well qualified and thoroughly experienced man, but he had not gone into the matter of tallying according to widths in a case of this kind, and for that reason he gave his concern the benefit of all the boards that were over the half-inch marks.

The lumber was shipped and in due time the customer was heard from. Though the distance was over a thousand miles his kick was felt distinctly at the point of origin of the shipment, and that without the aid of a seismograph. He kicked on the measurement of the lumber entirely, and not on the grade, which was all right. But the measurement differed from that of the shipper by over 1,000 feet! As this was on a shipment of good quartered oak stock the amount involved, as the reader will have anticipated, was enough to make the members of the firm which made the sale do some tall figuring trying to understand how it happened. A little correspondence developed the fact that the buyer had measured the lumber in the form indicated, while the shipper had used the ordinary board measurement system, to his ultimate detriment.

The worst feature of the whole situation was the fact that the purchaser of the lumber could not use boards that were of less than the specified widths, because they had to be finished for use with that dimension. The buyer, as a matter of fact, was purchasing dimension stock, although the result was obtained not by remanufacturing but by sorting, and obviously he specified widths that came as close as possible to the dimensions of the finished material. When he got narrower stock than this, he was unable to use it, no matter how strongly the argument might be made that it was unfair to the lumberman to deprive him of the measurement on all boards wider than the dimension specified.

In the case referred to the settlement was made on a basis that eliminated most of the profit, but members of the firm are now experienced enough to avoid making the same mistake over again. Hereafter, when they sell a car according to width they are going to allow for the loss in measurement which will result from the use of the 12-foot scale in this way and are going to make a price accordingly.

This, incidentally, is the only solution of the problem. It might be argued that the proper way to handle it would be to sell according to half-inch divisions, and that when sorting for width in the lumber yard to pile 6-inch, $6\frac{1}{2}$ -inch, 7-inch, $7\frac{1}{2}$ -inch, etc., separately, so that when the time came to load out a car of any given dimension there would be no necessity of giving the buyer something for which he would not be called on to pay. But there are a number of

practical difficulties in the way of the adoption of this plan. One is the greater amount of stock that would be needed to carry on the business, and to get a carload of any given dimension, and the other is that buyers seldom ask for widths of odd dimensions, usually ordering according to whole numbers.

The plan which seems to fit in with the needs of the situation most exactly is to keep in mind the probable loss that will be suffered and then charge for it. The lumberman realizes thoroughly when he sells a car of selected stock that he has had to put in additional labor to sort out the special widths wanted; he probably has had to do a good deal of careful sales work in order to find buyers for the various widths, and consequently he knows that he must ask a price for the lumber which will take care of the extra expense.

In the same way he can figure approximately, by reason of experience (and he can make actual tests which will determine the facts), what the loss in measurement is when the 12-foot scale is used as described, compared with ordinary board measurement of random widths, and consequently the proper system is to make an allowance in the price for this factor. Otherwise the result is likely to be a smaller profit per thousand than appeared from a superficial examination of the price at which the lumber was sold, compared with the figures quoted on unsorted material.

Another point that should be remembered in sorting lumber according to width, with the idea of being able to offer special service to the consumer, is that the especially wide stock necessarily must carry a higher margin of profit than the narrower boards. This is for the reason that the wide stuff usually has a considerable premium anyway, and the lumberman could get this without sorting if he were to sell on a basis of a shipment containing a given percentage of wide stock. As far as these items are concerned the labor of sorting them is more

or less unnecessary, from a sales standpoint, and is not required in order to get the maximum price for them. It is, however, a big convenience for the buyer who has been contenting himself with buying random widths, with a guaranteed percentage of wide stock, to be able to buy that class of lumber exclusively if he needs it, and he consequently should pay more in proportion for it than would be indicated by the premium offered for the percentage of extra wide stock included in an ordinary shipment.

As a matter of fact, many lumbermen who have gone into the question of sorting for widths have found that it is much easier to get the advanced price which they ask for narrow stock than for wide. Consumers who have been using the narrow stuff, but buying random widths and having to do a lot of ripping in order to get the right dimensions, have realized at once what a big saving they are making in securing the dimensions they need, while those who want wide stock have been getting a good deal of it by the payment of a comparatively small premium for its inclusion in a shipment of random widths. They fail to realize the extent of the service offered them by the lumberman who is prepared to give them exactly the widths they need.

The lumber dealer who is featuring the sale of special widths is a good deal like the millman who is cutting up his lumber into dimension stock: he must get a price commensurate with the added value he has given his lumber if he is going to be able to continue handling it in that way. The surest method of coming to grief in this business, just as in dimension manufacture, is neglecting the cost of performing the various features of the operation and failing to make a proper charge for them. Only by studying all of the elements involved and determining the proper price with reference to them can a fair profit on every sale be insured.

❁ Climatic Changes Recorded by Trees ❁

In regions of well defined seasonal changes the growth of a tree is marked by the formation each year of a layer of new wood intimately joined to that of the preceding year. Variations in width and composition of the annual rings of growth form a permanent record of the conditions under which the tree grew. The occurrence of a severe fire, an insect infestation, an unseasonable frost, or periods of abundant rain or drought may be read from the effects produced upon the wood formation from year to year.

The forester employs growth rings in determining the age of trees and in calculating the growth and yield of individuals and of forests. It has been only recently that there have been found in them evidences of climatic conditions and changes in times past. For more than two years work of this kind has been conducted under the direction of the Carnegie Institution of Washington. Part of the work was concerned with a study of data previously obtained by the United States Forest Service and part from original measurements of the stumps of a large number of the big trees of California.

A few of these trees proved to have started more than thirty centuries ago, the oldest being 3,150 years. Careful study of the rate of growth of over three hundred of the giant trees, many of them upward of 2,000 years old, strongly supports the belief of very decided fluctuations in climatic conditions extending over periods of several hundred years.

From the thousands of measurements or analyses gathered by the Forest Service in its investigation of tree and forest growth, a large number of the records of the oldest trees of certain species have been chosen for special study. Some of the species represented are western yellow pine in the northern and southern limits of its range; Jeffrey pine in southern California; Douglas fir in the Northwest; white oak and yellow poplar in the southern Appalachians; and red spruce in the north woods. It is only by averaging the rates of growth of a great many trees growing in widely different parts of the country and under essentially different local conditions that it is possible to eliminate

the many local factors affecting the development of individual trees and stands.

One conclusion from the study of western yellow pine in Arizona is that the climate of the Southwest is becoming drier, the snowfall less, the winters shorter, and that it has been doing so for a long time. This finding is corroborated by the presence in that country of irrigation ditches and other ruins of an ancient people, indicating that water was at one time fairly plentiful in places now remote from any signs of springs, streams or other sources of supply. Investigation of the rate of growth of the same species of tree in Idaho indicates that the winters there are also shorter and the snowfall less than formerly, but in this case the change in conditions is favorable to tree growth since it is producing a longer growing season.

In order to study the interior of living trees a form of drill was devised for removing a solid core of wood extending from the center to the bark. With these it is hoped to obtain data from the largest and oldest specimens of the big tree, which will throw more light on conditions as they existed thirty centuries or more ago.

According to the Ohio forester a large paper manufacturer in Ohio has leased and purchased nearly 300 acres of land subject to overflow and in low territory and has set out nearly 150,000 Carolina poplar trees to grow pulpwood.

* * *

A woman in Summit county, Ohio, has a small pasture of six or seven acres. Several years ago, in cutting out a portion of the trees where the stand was too dense for the good of the pasture, she left the walnut trees. In 1911 she sold from these trees \$114 worth of nuts.

Kraetzer-Cured Lumber

A common-sense method of lumber seasoning, as exemplified in the employment of the commercial wood steaming apparatus known as the Kraetzer steam cylinder preparator, has been previously discussed in *HARDWOOD RECORD*. Lest there be confusion in the minds of lumbermen on the subject, let it once more be stated that this apparatus is not a dry kiln, but an equipment for steaming under pressure the daily lumber output of a sawmill for the purpose of preparing it for quick and accurate seasoning, either in the open or by the agency of a dry kiln. By either method, lumber previously steamed under pressure is dried in less than one-third of the time that is possible with unsteamed wood.

Either a half score of the foremost lumber manufacturers in the United States are deluding themselves very seriously in the use of this equipment, or it is attaining for them drying results heretofore undreamed of. In economy of handling lumber and seasoning it, it is thoroughly demonstrable that the use of this apparatus effects a saving of between three and four dollars a thousand feet. Such being the case, it can be authoritatively stated that this system of preparing lumber for prompt and accurate seasoning spells more in increased efficiency than does the band saw over the circular.

Specifically: Both red and sap gum are being steamed in this

apparatus and blown out in a dry kiln to an average weight of less than 3,000 pounds, and loaded for shipment in six days from the saw. The same thicknesses of gum left on the steaming trucks and blown out in the air are reduced to the same or less weight even under bad drying weather conditions within thirty days. Five-eighths inch red and sap gum, after steaming, are blown out in the air, shipping dry, in approximately ten days. The same thickness of plain red oak and quartered white oak, after steaming and exposed only in the air for drying, is being shipped within twenty days from the saw, while one-inch oak is reduced to less than normal weight and shipped within thirty days from sawing. About the same time is employed for reducing sycamore, cypress, birch and maple, and similar woods, to shipping weight. In fact, all varieties of hard and soft woods that have been handled through this preparator system are being successfully prepared for quick and accurate seasoning.

In no instance has there been a failure on the part of a lumber manufacturer to achieve the best possible drying results by the aid of this steaming-under-pressure apparatus. This treatment of lumber not only insures quick seasoning, but accomplishes several other very desirable results. It absolutely prevents case hardening, surface

checking and end splitting, and, even with reasonable ventilation, obviates all stain and fungus growth. The process will not eliminate log splits, log stain or shake any more than it will knots and rot, but no additional seasoning defects obtain after the wood is once properly steamed under pressure.

The color and general tone of woods that are rich in tannic acid are somewhat deepened but are rendered uniform. This refers to such woods as red oak, mahogany, sycamore and red gum. The color of light-toned woods remains unchanged, while the beauty of the flake and figure in quarter-sawed stock is materially enhanced. Again, the texture of the wood is vastly improved, as is its milling qualities. Lumber steamed under an approved formula for pressure and time will dry out absolutely straight and flat. This is true even of the most refractory drying woods.

Wood steamed and subsequently seasoned dries out to materially less weight than unsteamed wood, the reductions varying from two hundred to five hundred pounds per thousand feet. In all varieties of lumber, this process materially reduces the shrinkage. Woods that show a shrinkage in drying under ordinary practice of from eight to ten per cent show a shrinkage of only approximately two per cent, and in some instances less than this. Another singular feature is the fact that after wood steamed under pressure is thoroughly dried, there is practically no swelling when exposed to dampness, and likewise there is no subsequent shrinkage. Even the grain does not rise when water stains are employed on it for finishing purposes.

Repeated tests have been made on steam-treated wood to ascertain if there is any impairment in strength, and it has been demonstrated that steaming under moderate pressure and time in nowise impairs the strength or quality.

Users of this apparatus find they are enabled to carry on their usual volume of business on a third or less stock than is usually

held in pile, on account of speedier drying, and in sundry cases manufacturers have been enabled to make sales of lumber which was still in the tree, and deliver it shipping dry within thirty days or less time. Hence it goes without saying there is a manifest economy in interest on investment and in insurance cost. Beyond all that, there is no inconsiderable economy in labor cost, for when the system is operated to its logical conclusion the lumber yard *per se*, with its roof boards, trams and planking, is entirely eliminated.

The lumber, after being piled on an equivalent to dry kiln tracks, is steamed, and then shoved out on to storage tracks, tilted side-wise, with a slope of one inch to one and a half inches to the foot, and the trucks removed for using over and over again.

An illustration employed in this connection shows a corner of the storage yard of the Lamb-Fish Lumber Company at Charleston, Miss., which employs this system. The lumber piles in the background are gradually being taken down and the foundations removed to give place for additional storage tracks. Other illustrations show the truck piling system employed by the Lamb-Fish Lumber Company. The counterbalanced gates in the rear of the loads are employed as guides for the accurate placing of piling sticks. Another picture shows a section of the rear of the truck loading spaces, and a portion of the transfer track leading to the preparator. Still another picture is of the preparator itself, in which a truck-load of lumber is being steamed; with another load on the cross-over track ready to go into the cylinder as soon as the load is discharged. At the right of this picture is the transfer track leading down to the storage yard.

In order to properly trade mark lumber steamed under pressure, and make a satisfying appellation for it, it has been decided to call it "Kraetzer-Cured Lumber," following the name of the inventor of the patented apparatus through which lumber is handled for rapid and accurate drying.

German East African Cedar

The East African cedar (*Juniperus procera*-Hochst) is a beautiful large tree from seventy-five to one hundred and twenty-five feet in height with a short, clear trunk, often measuring from two to five feet in diameter four feet above the ground. One writer states that in British East Africa the tree frequently attains a height of two hundred feet and a diameter of six feet. The tree is distributed throughout the mountainous districts of Abyssinia and tropical East Africa. It is very abundant, especially in Usambara, in German East Africa, where it forms the extensive Shume forests. It attains its best development at the base of Mt. Kilmandscharo and Mt. Kenia and up to an elevation of between 4,500 and 9,000 feet. On the north side of Kilmandscharo the tree ascends only about 7,500 feet, but it is very abundant. It is less common around Mt. Kenia, but grows to large sizes up to 7,000 feet. In parts of Usambara, where the tree is called "muangati," it grows at lower elevations, often forming dense isolated forests.

That the wood is of great economical value is best known from what Selimper says in his "Plants of Abyssinia": "It is the most valuable wood in East Africa for a good many purposes; it is used especially for construction material, and contains also an agreeable smelling resin." The wood is fragrant and light, but not strong. Its heart-wood when in contact with the moist earth is almost imperishable, and is much used for water troughs and for walls of houses. A noted traveler and explorer in German East Africa informs us that it is an excellent soft, light wood used for house and bridge building, and since the introduction of steam railroads it is the chief wood sought for crossties. It is used also for cabinet purposes because of its strong fragrant odor, which is said to repel insects.

It has recently been announced that the extensive Shume forests of cedar in German East Africa are now being exploited. This cedar is said to furnish a wood equal in quality to the average grades of the American cedars for making lead pencils, and occurs in sufficiently

large quantities to satisfy the needs of the German factories for a good many years to come, and their dependence on the American product is therefore now almost at an end. The German government had an investigation made of these cedar forests with a view to develop them and to render the timber supply available for use. It did not lose an opportunity to make known this large supply of cedar wood, and a concession has recently been granted to a company for the exploitation of this valuable timber. The company has constructed a cable-tram line at a cost of nearly \$400,000 for the purpose of bringing the cedar logs to the mills. This tram line is now being successfully operated and the cedar logs are converted into lumber and transported by rail to the port of Tanga, in Usambara. From this point it is shipped by the steamers of the East African Line to Hamburg, which is the principal distributing center.

Many government officers have tested the lead pencils made from this East African cedar and have approved them; the Prussian ministries of Finance, and of the Interior both have recommended that pencils made from this wood should be given preference. Practically all the leading German lead-pencil factories are now using some African cedar, and the pencils made from it are pronounced to be equal to those made from the American cedar. A few of the manufacturers qualify such a claim in some particulars, as, for instance, that pencils made of American cedar are sharpened more easily.

How long the supply of red or pencil cedar of this country will last at its present rate of consumption is difficult to say, but it is certain that unless some of the substitutes that have recently been tested will prove satisfactory a few of the mills now in operation will be obliged to import the wood from Africa. Pencil makers in this country have long since been searching for a suitable wood and as soon as the commercial value of this African cedar can be fully established they will doubtless avail themselves of this new source of supply of raw material.

L. L. D.

Low-Grades on a Bull Market

If one were asked to state the leading feature of the hardwood situation of the past two or three years, it is likely that an answer that would come closest to the truth would be the increasingly strong position of the low-grade lumber. Just now, of course, practically every yard is denuded of most of its common and cull lumber, and where there are slow movers it is nearly always in connection with lumber above the No. 1 common grade.

Those familiar with the constant references to the decreasing quality—and increasing cost—of timber in the hardwood producing sections have been prepared, as a theoretical proposition, to demonstrate that prices on low-grade stock are destined to fall, relatively, reasoning in this wise: The proportion of low-grade lumber to the total produced is becoming larger. The demand for good hardwood lumber is certain to be fairly constant. Therefore, with the supply of the latter decreasing and the demand remaining the same, or possibly growing, the value of upper-grade hardwood is certain to rise. On the other hand, with a greater amount of low-grade lumber being manufactured, without any apparently greater outlet than heretofore, the strength of the demand is certain to diminish and prices certain to fall, compared with those of high-grade stock. *Quod erat demonstrandum.*

The theory of the proposition, like a good many other theories, has bumped into at least one solid fact that has knocked a hole in it and left out a good deal of supporting gas. The fact of most consequence is the increasing local consumption of low-grade hardwoods at the point of production. The southern states are the largest producers of hardwood lumber, and at the same time form a section which is experiencing the most rapid industrial development of any in the entire country. This has been accompanied, as every community development is accompanied, with consumption of lumber on a large scale.

One interesting evidence of this fact is shown in eastern Kentucky, where a lot of railroad development work has recently been completed, the result of which has been to increase the production of hardwoods in that territory. But while a large quantity of lumber is being cut, a great deal of it is being used right at the mill, or very close by, in the construction of buildings for coal mining companies. These concerns use millions of feet in building tipples, company offices, houses for miners and other buildings, and are certain to continue to take a large part of the total production of the sawmills in that territory, as the development of the mines and the timber is going forward practically as one operation, both being dependent upon and the result of the creation of transportation facilities.

In territories which are not to be regarded as new, in the same sense as the eastern Kentucky sections where trees have been allowed to stand, because there was no way to get them out either as logs or lumber, industrial development on a large scale is going forward. In Tennessee, for example, a water-power company capitalized at \$20,000,000 has been organized. This is now building two large power plants on rivers in eastern Tennessee and is constructing transmission lines to the principal cities of the state. Smaller companies have begun similar development work on other rivers, and the manufacture of power so cheaply that industrial activity is certain to be encouraged is already an assured fact.

This means a great deal for Tennessee, and it means incidentally a good deal to the lumber interests of the state. With cities growing rapidly all over the state, new factories being built, new homes being constructed for the additional population and consumption of the products of the sawmill going ahead apace, it is certain that a greater proportion of the output of the lumber manufacturers will be used at home.

The Southwest, including Arkansas and western Louisiana, is a large producer of hardwoods and has a greater future supply of hardwood timber, perhaps, than any other part of the southern territory; but like other parts of that section the Southwest is growing rapidly and is maintaining a steadily increasing consumption of lumber.

The completion of the Panama canal is confidently counted on to help every department of business in the South, and while definite proof of this result is as yet not forthcoming, it seems certain that the stimulation which may be expected from such a gigantic improvement as the linking of the oceans will be evidenced in broader and more aggressive business development.

The whole story, then, is that the South, which has been, and at present still is, an agricultural section for the most part, with lumber production the next leading interest, has reached a point where the development of general manufacturing is certain to be an important feature of the situation. The question still remains, however, as to why this expansion along industrial lines should affect low grades more than any other kind of lumber.

In the first place, new development, such as that in the eastern Kentucky coal district, is of the kind which obviously is completed without much attention to finish or ornamentation; utility is the big thing, and the heavy structural end rather than the finish is given chief attention. In other sections, the cutting away of the timber has converted the woodlands into farms, requiring barns, fences and other equipment, all of which is of the sort which takes low-grade material. Another consideration is that the more valuable a commodity is the greater the distance it may profitably be shipped. Hence it is logical that where there is a local market for the millman he is glad to utilize it in the direction of moving low-grade lumber, knowing that he can dispose of his good stuff to buyers at points far removed.

The experience of large lumber concerns throughout the Ohio valley, many of which purchase a large part of the output of small mills in the central South, is that less low-grade stock is being offered than ever before, and that the sawmill men are getting rid of this material in their own localities at as good prices as outside buyers are willing to pay for it. Thus they are undergoing a metamorphosis which is converting them into retailers on their cheaper stock, while they are continuing to dispose of the better grade lumber in larger quantities.

Lest it be thought that an obvious feature of the situation is being overlooked, it is worth while to remember that many buyers who formerly thought that they had to have firsts and seconds lumber for their particular purposes have discovered that they can get along very well with No. 1 common and even lower grade lumber. In other words, the higher price of lumber all along the line has caused many to arrange for the use of low grades, thus emphasizing the demand for this character of stock. This is a development along desirable lines, since it strengthens the demand at a point where the greater part of the supply is located.

That there has been a big change in the situation here is indicated by the fact that an executive of one of the large hardwood lumber organizations made a trip to conventions of various consuming manufacturers several years ago, demonstrating to them, by chalk talks and otherwise, that it would pay them to buy more No. 1 and No. 2 common lumber and a smaller amount of firsts and seconds. At that time the preponderance of the demand among manufacturers of case goods was for the higher-grade stuff, almost to the exclusion of the cheaper kinds, and the big problem of the sawmill man was to get rid of his low-grade lumber. Now that consumers are educated to using low-grade hardwoods, however, such a problem is no longer in evidence, especially in view of the other factors affecting the situation, as pointed out above.

The development of dimension stock business was originally put forward as a solution of the low-grade problem of the manufacturer; but, significantly, the improvement in the demand for this kind of stock has resulted in the consumer becoming the leader in the call for dimension lumber, which many sawmill men are no longer desirous of making, under the conditions as to price which now obtain.

"I never saw low-grade hardwood lumber so scarce as it is today," said one of the leading wholesale lumbermen of the Middle West.

who likewise has extensive manufacturing interests. "And I do not regard it as temporary, but rather as the development of a permanent condition. Consumers are using more low-grade stock, while there is less being offered by the smaller producers than ever before. While all kinds of hardwoods have advanced in price, the increased values of low-grades are noteworthy because of the relatively larger

production of this kind of lumber. I have noticed that lumber prices seldom decline greatly, in spite of temporary fluctuations, and therefore I am inclined to believe that the present high prices being paid for common lumber are likely to continue, along with a steady demand, particularly as there is no possible chance for any excess of supply in the near future.

An Analysis of Wood Values

To those who handle lumber as a business without having made a study of its utilization, it is often not clear just what are the properties which, directly or indirectly, lead the artisan to prefer a particular kind of wood for a special purpose. Not infrequently a lumberman handling certain woods will prevail upon a manufacturing consumer to try out a wood as a substitute for the species which he has been accustomed to use, and often with disastrous results to both parties. Woods differ much in both physical and mechanical properties; one may be entirely adapted for a specific purpose and yet another and almost similar species may be totally unfit for the same use. A better knowledge of the properties of woods would be of material assistance to the manufacturer, the distributor and the consumer. The properties of wood which make them desirable or undesirable, as the case may be, for a particular use may be grouped as follows:

- 1—Mechanical properties, such as strength, toughness, stiffness, etc.
- 2—Physical, such as weight, length and character of fiber, and behavior during and after seasoning.
- 3—Chemical, such as color, durability, and value as fuel.
- 4—Structural, such as texture, beauty of pattern, etc.
- 5—Biological, such as form, size, and abundance.

Of the several groups, the mechanical properties naturally take precedence, and of these, toughness and stiffness are unquestionably the most important, so that even the most general classification of woods into "hardwoods" and "not hardwoods" (for this latter class, though by implication the conifers, has so far no name in this country) depends not at all on hardness as the word might suggest, but on toughness, the tough woods being the hardwoods, the others the conifers. Since toughness is a combination of strength in several directions, the various forms of strength should first be considered separately.

When in use, wood usually breaks in bending, as in the case of an axe or fork handle, or else in shearing or splitting, as seen in planks and boards, whether on the sidewalk or in the wagon body. Wood fails much more rarely in compression, though much exposed to this form of strain, and still less frequently in tension, since in this direction its resistance is enormous, and can, in ordinary articles, never be brought to fair trial.

Fundamentally, all strength of wood depends upon four different forms of resistance, namely, the resistance to tension, or lengthwise separation of the fiber; resistance to compression lengthwise; resistance to compression sidewise, or to collapse of fiber, and lateral adhesion of the fibers. Where a stick of wood is tested, none of these forms of resistance can be isolated and tested separately, and in every kind of failure two or more are represented.

Since the strength of the fibers in adhesion is very much less than in tension and compression, adhesion enters into nearly every test as an important factor.

Thus, if a piece of wood consisting of several fibers is tested in tension, the fibers would probably not break at all, but be merely pulled out, the failure, as far as they are concerned, being due to lack of adhesion and not to a lack of tensile strength. Every tension test presents numerous cases of this kind, the broken fibers presenting the even fracture, but being splintered and drawn out, especially if the wood is good.

In the same way when a piece of wood is compressed lengthwise,

some fibers badly situated with regard to the action of the load collapse or else crush into their neighbors, and immediately a breach develops, into which fiber after fiber falls, the breach spreading from this point; and the whole mass of fibers, now no longer adhering in this plane, behave as a great number of separate fine strands—they "buckle," and the piece fails.

Bending is a compound test of compression on the upper (concave) side of the beam and tension on the lower (convex), and numerically stands between these two; that is to say, if a stick breaks in bending, whether it break first on the upper side (in compression) or on the lower side (in tension), the bending strength, as commonly stated, is neither equal to the compression strength nor to the tension strength, but lies between the two. Here, as in the cases cited, adhesion forms one of the factors, since at failure, part of the rupture consists in a separation of fibers.

Shearing along the fiber is simply a test in adhesion, where the force acts in line parallel to the fiber, and the values in shearing wherever tested agree with those of tests in "transverse tension," as the test of adhesion may be termed.

In splitting or cleaving, the case is, like shearing, almost entirely one of transverse tension; with this difference, however, that the force is applied to a small area and acts on a lever (the side of the cleft); it acts, therefore, the more effectively the longer the cleft and the stiffer the wood. From what has preceded, it is evident that the adhesion of the fibers, or better, the resistance to transverse tension, is of great importance. Examining the structure it is quite apparent that this resistance is greatly influenced by the shape and relative position of the fibers. In hardwoods the cells do not arrange themselves in rows; hence, there are no natural cleavage planes (except at the pith rays). A knife passing along a line does not merely separate two layers of fibers; it has to cut through the cells themselves; while if passing through coniferous wood it finds a natural plane of contact between two sheets of fibers, and thus has easy work. Moreover, the course of the fibers in hardwoods is rarely straight, the fibers are generally in oblique positions (best illustrated in elm), they "interlace," and if a piece of wood is split the surface is fuzzy with the myriads of fibers which were not merely separated, but were torn in tension, the very way in which they offer the greatest resistance. For these reasons hardwoods have generally a much greater strength in transverse tension than the conifers. Thus, oak excels hard pine nearly as two to one. Where this greater resistance to transverse tension is accompanied by a greater flexibility, by more "give," as is nearly always the case with hardwoods, the wood becomes tough; a blow may indent, but does not shatter.

This toughness is a combination of relatively great strength in transverse and longitudinal tension together with a fair amount of flexibility or capacity to endure distortion. That toughness varies widely is well known, as is shown in the elm, which excels in toughness, and in the yellow poplar, which possesses but little. Naturally the hardwoods exhibit it to a much greater degree than the conifers. Even a poplar board will bear far longer the constant jar and jolt and wrench which it must endure as a part of a wagon box than a very strong piece of pine or other conifer, and great toughness, such as exists in good hickory, is not possessed by any known coniferous wood.

Hardness in wood means the resistance which any surface, but

particularly the sides (longitudinal faces) offers to the entrance of a blunt body, such as a hammer. The test in hardness is one of transverse compression of the fibers, and therefore depends on their resistance to collapse. In a single fiber this resistance depends on that of the material (presumably alike in all wood), on the shape of the fiber, and the relative thickness of its walls. Fibers like those of hardwoods (fibers proper), with a hexagonal cross section and commonly scarcely any cell lumen or hollow, naturally, behave almost like solid wood substance. They offer great resistance, so that if the outer surface of a stick is formed by such fibers its hardness is very great. If, on the other hand, the surface layer is composed of thin walled vessels or of tracheids, like those of the springwood in conifers, the wood is soft. In the usual test the indentation extends but a short distance ahead of the instrument (as, for instance, when a timber is struck with a hammer); but if the test is continued long enough the compression results in destruction of all the thin walled and much of the thick walled tissue of the wood, so that timbers, such as those sometimes buried in collapsed portions of deep mining shafts, are destroyed throughout. Such a crushed stick continues to resist further crushing, becomes compacted, dense, and heavy, but loses nearly all its bending strength; it takes up water rapidly, and when soaked crumbles like wood in the later stages of decay. Closer examination shows that all thin walled fibers have collapsed just like crushed pasteboard tubes, the break running along two or more lines the length of the fiber, the form of the cross section being changed from a hexagon to an S shape, or an approach to this form.

The hardness of wood in the sense as noted is quite variable, even in wood of the same species, varying on different sides and also according to the portion of the annual ring exposed at the surface, the extent of compression, and other circumstances.

In nearly all wood used for construction, whether a bridge timber, the studding or joists of a house, or merely a table or chair leg, the stiffness of the wood is an essential quality, and in many if not most cases it is far more important than the ultimate strength. Thus, a rafter or joist need not be very strong, but it must bend but little under its assigned load, and even in furniture and smaller objects the piece must not only be sufficiently large to hold up its weight without breaking, but to hold it without being distorted to an unsightly or troublesome degree. In this case ultimate strength is not considered, but stiffness or elasticity rather, and in the majority of cases a "strong wood" is, with the artisan, really a stiff wood. The stiffness of a piece of wood depends upon its weight and on its structure. If a single fiber of pine and one of hickory, both of the same size and thickness of wall, could be tested, they would probably be found alike in stiffness, strength and degree of extensibility, for both are practically alike chemically and physically. The great difference between these woods must therefore be in the combination in which the fibers occur in the wood structure, and it is in this that we find a ready and plausible explanation for differences. An examination of a piece of typical hardwood and a piece of coniferous wood shows that,—

1—The elements of structure are alike in conifers, unlike in hardwood.

2—They are all large (comparatively) in conifers, while in hardwood extremely small elements (fibers proper) form scattered bodies among larger ones (parenchyma) and very large ones (the vessels).

3—These bodies of small fibers, the strongest part of the wood, have extremely thick walls, compared to their size, in the hardwoods, but much less so in the conifers.

4—The fibers in conifers are arranged in perfect rows (or really sheets, for the cells of each row are practically conterminous), those of hardwoods are found in divided bodies, and appear like separate strands of specially strong material. In addition, the fibers (tracheids) in conifers are usually much longer than those in hardwoods. On account of these structural conditions the fibers in the conifer act much more perfectly together and allow less

"give" than the heterogeneous elements and especially the separated strands of fibers in hardwoods, which arrangement permits more "give," and this "give" lessens the stiffness or elasticity of the hardwood. For if we return to our single cell we would have the upper part compressed when the fiber is bent, the lower extended, and the behavior would simply depend on the shape of the fiber and the material of its wall, but if we have a set of fibers and vessels grown together and tested the behavior depends not only on their shape and the material, but also on the relative position of the fibers and other elements. Those which are crooked or oblique on the upper side of the stick will have their unfavorable attitude increased, those on the lower side will merely be straightened or but partly strained, while the main part of the load applied at first is borne by only a part of the fibers, that is, those straightest in their position. Here the large fibers of the conifer with their regularity of arrangement all fall in line at once, they are "straight grain," the "give" is small, and the timber is stiff. Moreover, when the load is removed the ease is exactly reversed. The fibers of coniferous wood, all being strained, exert the same power to return, while many of the fibers in the hardwood, on the other hand, are really under but little strain, they make little effort to return, the timber does not "spring back," and thus is neither very stiff nor springy or resilient; it is not very elastic. Thus, it is that conifers are, as far as known at present, generally stiffer than hardwoods of the same weight, the difference often being very considerable. The finer and more even the structure of the hardwood, the straighter the grain, the greater the weight of the wood, and the more perfectly it is seasoned, the stiffer it is. In conifers this quality seems to vary directly with their weight. In hardwoods the matter is too little known to warrant any general statement, though here, too, heavy woods like oak and ash are stiffer than light woods, such as poplar.

PHYSICAL PROPERTIES

Weight is an important indicator of the mechanical qualities of wood and a direct measure of its value as fuel or material for coaling and dry distillation, and often determines the choice of woods for a particular purpose. Thus, panels and other surface lumber in vehicles, threshers, and other movable articles, which should be no heavier than necessary to perform their function, and all lumber for shipping crates and boxes, especially where these must be tight and stiff, are invariably selected from the lightest wood obtainable.

Generally speaking our conifers are lighter than the hardwoods, but there are light and heavy kinds in both.

Shrinking, swelling, warping, and checking are the greatest drawbacks to the use of wood, and are all expressions of the same property of wood material, namely, its hygroscopicity, or capacity to absorb or give off water and thereby change its volume. All the walls of the cells grow thicker if a dry piece is moistened. This increases the size of the cells and thereby the size of the piece. The larger the single cell elements the more rapidly the water can get to or from all parts, and the nearer all cells are alike in size the more nearly they shrink and swell alike.

This explains why pine or other coniferous wood shrinks and swells much more evenly than hardwoods, and also why it is more susceptible to moisture. It also accounts for the fact that the lighter hardwoods give so much less trouble in shrinking and swelling than the heavier ones.

CHEMICAL PROPERTIES

Since the chemical composition of the cell wall of all woods is quite similar, the value of wood as fuel and in dry distillation merely depends on its weight. Of the chemical properties important in construction, it is chiefly durability—resistance to decay when placed in the ground or otherwise unfavorably exposed—and color which enter into the selection of materials, both dependent on chemical combinations. What the substances are which make the heart of cedar and white oak durable and what the processes are which lead to their formation are as yet but little understood. It is certain that these bodies are present only in

very small quantities, but perfectly permeate the cell walls and commonly appear together with more or less sharply marked changes in color.

Generally, trees with durable wood form a distinct heartwood, but their sapwood is no more durable than that of other kinds. Since durability depends mainly on resistance to living organisms, proper experiments to determine the relative durability of woods are exceedingly complicated, and satisfactory results are still wanting. In the absence of better data, the "life" of railway ties as commonly observed will in some measure answer this purpose.

An even color, a darker or lighter shade, are such important elements in the appearance of wood that in all finishing work color is one of the chief considerations in the selection.

STRUCTURAL FEATURES

Besides being intimately related to the mechanical properties the structure also determines the texture and almost entirely the beauty of the wood. Texture may be said to be coarse when large pores, in rows or scattered, appear as holes on the ends or as dark streaks (troughs) on the sides, as in oak and ash; it is moderately coarse if all its elements are large, as in pine, and it is fine if all the elements are small, as in cherry, and much more so in boxwood. Apart from the appearance of the wood, the texture is often in itself a property which fits or unfits the wood for a particular use. Thus, red oak is useless for tight cooperage or for a delicate piece of carving, because in the one case it leaks, in the other its own coarse-texture lines will mar and distort the picture.

Structure is the first element of beauty in wood. Its uniformity

of structure makes white pine monotonous; the striking difference of spring and summerwood renders hard pine obtrusive; the arrangement of vessels, fibers and pith rays characterize oak, and the peculiar arrangement of the same elements gives to elm those handsome figures of dark wavy lines on an even background of brown. Without analyzing or inquiring into their cause, the several patterns have become familiar to all, and the beautiful furniture in oak and maple and cherry and walnut testify to their recognition and importance.

BIOLOGICAL PECULIARITIES

Size, form and abundance of wood more than any other features have influenced the development of our wood-using industries. Man is indebted to a large degree to the large, long shafted, and well formed conifers for assisting him in his progress. Occurring on extensive areas and combining most useful qualities, they are generally sought for structural purposes. If a carpenter were obliged to rely upon beech, birch, chestnut, oak, poplar, etc., and had to use them in combination, house-building would be not only much more difficult and costly, but unsatisfactory. While the stringer and joist of pine would keep straight, its neighbor, the oak, would sag down, the chestnut would warp out of line, the beech and hickory would soon be infested with boring insects, and the whole would be a failure. Abundance in suitable size, form and qualities made white pine the king of American woods for certain purposes and so fully are those properties appreciated in practice that it required a severe struggle to introduce, for instance, such excellent material as cypress as a substitute.

The Trade Journal

Editor's Note

The following is an address delivered before the Louisville Rotary Club February 10, 1913, by G. D. Crain, Jr.

A song which was heard at a recent meeting of the Rotary Club was, "We're here because we're here." Some of the business men of this country once believed that the trade journals had no better excuse for existence than that; but the trade and technical papers have proven their usefulness, and they are here to stay. Instead of being merely tolerated, they now are welcomed and made use of.

What is a trade journal? It is a paper which is made to interest but one class of readers. Technical papers, such as those for architects, engineers, machinery men, etc., are usually included in the same class, though sometimes the distinction is made that trade journals are for those engaged in the distribution of a given class of goods, while technical papers cater to classes which consume certain products. For example, the Clothier & Furnisher is distinctly a trade journal; while Engineering News would be classified in the technical field.

I believe I am safe in saying that the dominating idea of the present, as far as the commercial world is concerned, is greater efficiency. The problem of doing the thing better, or more quickly, or more cheaply, has been studied at every point, from the factory to the consumer; and the science of management has been evolved from a consideration of the details going into the production of goods or sales in the best possible way.

The trade journal, as I see it, has been more responsible than any other thing for the increased efficiency of the modern business man.

This is of course a broad statement, and yet I believe consideration of the facts will demonstrate its truth. In the first place, it has provided a medium for the discussion of new ideas; and in the second it has developed a lot of them of its own initiative.

Whenever a new plan for improving methods of production or management is evolved, the best place to get a clear, complete and

authoritative statement of it is in the pages of the trade journals covering the fields affected. It will be there—you can count on that. On the other hand, whenever anybody discovers that he has a better system of cost accounting or a better method of handling material than has been used in his line previously, he is quite likely to tell the trade journals about it sooner or later, directly or indirectly.

This leads me to remark upon a peculiar and interesting coincidence, and that is that the live wires of every business are invariably the men who read their trade journals most closely. I do not say that they are live wires because they read trade journals; it may be a cause instead of an effect. But at any rate it is certainly significant that the men who are making the biggest successes are those who are giving close attention to the business papers in their respective fields, and are using them in a way calculated to get out of them all the value that they possess.

The trade journal idea is a good deal like the basic principle back of the Rotary Club, as I understand it. It is the thought of everybody helping everybody else. In the Rotary Club men come together for exchange of ideas and mutual benefit and everybody profits.

In the trade journal, when an ideal condition is realized as it frequently is, members of the business pool their experiences, the sum total being definite and established facts that can be relied upon to help everybody in the business.

If the trade journal is in the news class, perhaps giving members of the trade in which it is interested timely information on the movement of the leading commodities, it has correspondents located in the principal cities, and these furnish a complete and reliable story of the developments of the market up to within a few hours of going to press. Many of these great journals maintain branch offices in the leading centers, with salaried

managers and staffs. A company which publishes several papers in the men's wear field has large offices in New York and Chicago. It keeps a Chicago printing plant working on its papers about all the time, and in addition prints two daily papers in New York. Big organizations like this cost a lot of money. One of the leading trade journals in Chicago spends \$4,000 a week, outside of the actual cost of printing, this including a staff of seventy-five correspondents, eight or ten editorial writers in the main office, and a big road staff used in advertising and special work. Papers of this kind are producing something distinctly worth while.

Most of you would be astonished to learn that there are 738 trade and technical papers and this does not include farm, law, medical journals, which belong in the several categories of class publications. It is an interesting fact that the past ten years have been marked by a great increase in the number and a great improvement in the quality and trade and technical journals of all kinds. The trade paper of the old school, printed originally as a means of conveying market information, did little more than this, filling up a good many pages with polite personals about the various members of the trade. Likewise, such a paper attempted to cover the entire industry, from the origin of the raw material to the consumer. The effect was superficial, disjointed and uncertain.

The typical trade journal of today is radically different. It is chiefly educational in character, and smacks more of the magazine than the newspaper, although in many lines the market or news feature will always be predominant.

It likewise selects, as a rule, but one class of the trade or one section of the country, and cultivates that field intensively, rather than extensively. Thus many papers are made for the manufacturer only or for the retailer only. Many circulate altogether in the Middle West, others take the South, while there are, of course, many which cover the national field, from a standpoint of circulation.

But whatever its plan of production, the twentieth century trade journal has a service to perform, and it performs it. It has something of value to say to its readers, and it usually says it in an interesting and convincing manner. It has the intimate touch, the familiar tone, the vocabulary and the ideas of the man in the business it reaches; it is by, for, and of that business, and consequently it has a value that no merely general publication could ever hope to have.

This, incidentally makes the trade journal reaching a carefully selected class a remarkably productive advertising medium. When the average person thinks of advertising, it is in connection with the newspapers or magazines which are what the experts call consumer publications. Consequently the big national advertising campaigns, which are intended to make the name and characteristics of a product known to the general public, are featured in periodicals of that character. It is a fact that some of the largest and most successful advertising campaigns on record have been conducted almost altogether in the trade publications. The public generally never hears of them, and it is not intended that it should; but they are getting results of a definite, measurable character.

The General Electric Company, which is known as a great national advertiser, is carrying the battle for business into every manufacturing paper of consequence, applying its sales arguments definitely to the products covered by the several publications; the result being that when a brick manufacturer picks up his trade journal, he sees an ad telling about what General Electric motors have done in brick plants; the woodworker or furniture manufacturer hears of them with relation to that use only; textile operators are talked to with reference to their special requirements, and so on. Each argument has an inside aspect which gives it tremendous force.

I believe that the advertising of the future will be largely confined to just such carefully selected mediums. I mean to say not that the general magazines will cease to exist, but that there will be fewer of them, and that they will carry less advertising as the manufacturer finds that he can get the same results at a smaller cost by using the trade journal for distribution and the newspaper

for local sales work, with the technical papers forming the link between the producer and the consumer of products which are not distributed generally, such as machinery.

If I were to be permitted to make one plea on behalf of the trade paper, it is this: Use it. The journal that is published for a special class can not accomplish its purpose unless it numbers among its readers a fair percentage of those in that class. Merely subscribing to such a paper does not end the job. It should be read carefully, from kiver to kiver, as the old ducky said, including the advertising. No one can do this without benefiting by it; and the benefit will be measured exactly by the amount of interest put into the study.

Conditions Abroad During January

LIVERPOOL

The arrivals from North American ports at Liverpool for January were 11,103 tons, as against 6,900 tons in the corresponding month last year. The business of January was rather quiet in comparison with December trade. This condition, however, was anticipated. The average values are high and generally steady. There has been little chartering for ocean transportation done for next season.

The arrivals of oak logs from the United States, included a shipment of 23,000 cubic feet from Mobile. Deliveries have been satisfactory and stocks at present are light with firm values prevailing. There was a moderate importation of wagon planks during the past month and the deliveries have been on a moderate scale. As a subsequence, values of first-class stock of this sort are firm. The stocks of wagon oak planks, including outside depots, amounted to 192,500 cubic feet at the beginning of the present month as against 140,500 cubic feet February 1, 1912.

No import or consumption of elm was noted during the month. The arrivals of ash totaled 6,000 cubic feet during the month and the consumption 3,000 cubic feet. Light stock and firm prices are noted. The supply of ash logs was disposed of readily.

The month closed with an active demand for black walnut logs at very satisfactory prices. The demand for walnut boards and planks has been steady during the month. Good grades of satin walnut (red gum) boards were actively inquired for during January. On the other hand, there was little or no demand for satin walnut logs and little encouragement is held out for shipments in the immediate future.

The demand for yellow poplar logs was steady, particularly for good quality of timber of good size. A moderate inquiry at steady prices prevailed for yellow poplar planks and boards.

January showed an import of 3,000 cubic feet of birch logs into Liverpool. The consumption was 7,000 cubic feet. Stock is but moderate and prices are generally firm. Both import and consumption of birch lumber has been moderate, while stock on hand was sufficient at the end of the month and steady values prevailed. There was a fair inquiry for well manufactured hickory lumber of good grades. Round hickory logs showed a good demand and firm prices during the month.

HAMBURG

According to a report from Hamburg, business during January was rather above the average level for that month. Trade during the first month in the year usually is somewhat restricted on account of inventory taking and because of the fact that river transportation to the interior is often hampered by bad weather conditions. While there is some apprehension that the month of February will before its close bring labor troubles in the furniture manufacturing circles, still the outlook for 1913 is good.

Speaking of the demand for black walnut, the report states that while buyers were prepared to pay higher prices for the best grades, shippers were reluctant to offer such stock.

Fairly large quantities of white oak were sold during the month of January and the demand still continues strong. Red, sap and tupelo gum were in good request during the month. A number of contracts were arranged. While the level of prices in cottonwood prevented business in some quarters, still a considerable number of satisfactory transactions were closed.

Briggs in the Chicago Tribune

Impressions of a Tenderfoot

Second Paper

To people "down East"—and Chicago is down East, from the viewpoint of the Inland Empire and the Pacific coast country—the distances encountered in railroad journeys in the great West are appalling. From Chicago to Missoula, Mont., the first principal lumber manufacturing point touched on the journey to the Northwest, is two solid days on a limited express train.

Again, when a man thinks of a night's journey from Portland to San Francisco, for example, he is astounded when he finds that by the de luxe Shasta limited the trip consumes twenty-eight hours. Indeed, it is a deuce of a way between things in the great West.

To the stranger, Missoula, Mont. (and Missoula is a type of hundreds of other small enterprising cities of the West), is surprising in many features. It has none of the wild-and-woolly-West appearance that the Easterner would naturally expect. Both the business structures and the residences are of a substantial and handsome character. The streets are well paved; electric lights and electric light signs are everywhere in evidence; there are good street car service, splendid school buildings and alluring shop windows that are not excelled in any eastern cities of double its size. It almost seems that these westerners go to extremes on the electric light proposition, and perhaps it is the very cheapest thing in the whole country because you find electric lights in profusion everywhere.

These Inland Empire hotels are rather surprising to the wayfarer. Most of them are simply lodging houses, and the guest inquiring for the dining room is told to "go to the left" or "to the right around the corner" where he will find a restaurant. These restaurants vary from the "ride-the-pony" variety like Thompson's Spa at Boston to a fair counterfeit of one of Childs' best that you encounter in New York, Philadelphia and Chicago.

I visited only one of three sawmill operations at Missoula owing to the absence of the principals of the others, and this was one of the three sawmills of the Anaconda Copper Mining Company, presided over by Kenneth Ross. Kenneth Ross is a lumberman and one needs spend but a few hours in going through the Bonner sawmill, its yards, planing mills and door, sash and box factory to be convinced of that fact. It's a big operation, mighty well handled.

While trailing the Northern Pacific I went over to the little town of Ravalli, some eighty or one hundred miles west of Missoula. Ravalli is simply a tank station, but here I encountered a cowboy who was spending his time in negotiating an automobile. It was a six-cylinder Pierce-Arrow—not of the latest type, but it still had four wheels under it and a gasoline tank and an engine, but it was entirely deficient in a hood, and a considerable portion of the upper works were missing. I made a contract with this brigand to take me up through the Flat Head Indian Reservation of Mission Valley, thirty-five miles, to the south end of Flat Head Lake. It was just thirty-five miles, and this cowboy was certainly some chauffeur, because he took me up this valley, uphill and down, over bunch grass and tumbleweed, over about as much semblance to a road as you would find in darkest Africa, in just two hours. It was a nerve-racking trip, and the reasons I had for not jumping

from the vehicle and finishing the journey on foot was that there was a boat to catch at the foot of the lake for Somers, Mont.; and again, I recalled the Jewish story of the sinking ship, about which Abe was putting up such an awful hallabaloo, when his friend Ike observed:

"Abe, what are you kicking about? It ain't your ship, is it?"
It wasn't my automobile.

This Mission Valley, with its quaint Catholic mission houses away up between the mountain ridges, is very picturesque and has, it is said, wonderful eventual agricultural possibilities. The government is now engaged in gigantic reclamation work involving the building of scores of miles of concrete irrigation ditches, and it is going to be a great country some time.

From the foot of Flat Head Lake to Somers, Mont., the journey on a little flat-bottomed steamer, is thirty-one miles. I arrived there at night after an all-day's trip from Missoula, and then went up to the general headquarters of all the sawmill men in this district at Kalispell, twelve miles distant, on a plug road of the Great Northern.

Here I found another tidy little hotel on the lodging house plan, where you go around the corner to get something to eat. Here I also encountered A. E. Boorman, who is a prince in disguise, but incidentally is secretary of the Montana Larch Association. Here I also "met-up" with a half dozen more of the leading lumber operators of the district.

Just a word about Boorman. He takes a stranger to his heart and just quits everything to make life pleasant for him. He knew exactly where I could get pictures of every forest tree that I lacked in my collection, and tramped with me for miles in the forest, and insisted upon toting my fifty pound camera besides. I am going to do my best to secure Boorman a front seat in the alluring place of the Great Beyond.

Kalispell is the center of Montana larch production. Although this district produces sundry other kinds of wood, the so-called larch is the predominant one. Government reports don't say so, but it is alleged there are twenty billion feet of this wood growing in this section, with Kalispell as the center.

The word "larch" does not spell anything to the uninitiated, but in reality larch is western tamarack. But don't let that worry you, because western tamarack is nothing like its eastern namesake. It has a reddish brown bark, is tall but of comparatively small size, and has an average age of perhaps four hundred years. The winter growth is hard, the summer growth a good deal softer. It is relatively a light wood in weight, but has possibilities as a rift-sawed lumber unexcelled by the very finest type of long leaf yellow pine. To my mind it is the softwood flooring that will be the flooring of the future, to take over the bulk of the trade that can't be filled from oak and maple. To achieve the best results it should be rift-sawed, because the flat-sawed stock, owing to its proneness of cleavage between the summer and winter growth, does not produce very desirable results as a lumber product. In fact, little attempt is made to produce this lumber in anything above six

inch widths. However, it is a mighty good wood, and with proper manufacture, seasoning and handling there is a big future for it.

On my way to the great western commercial center of western Washington—Spokane—I made several stops at various sawmills, where I found fir, cedar, larch, white pine and western pine being produced in large quantities. A good many of these western operators are still depending on the uncertain mountain streams for the transportation of their logs, with the result that a good deal of log stain is observable in the product; and again the character of the atmosphere does not contribute to good seasoning, with the result that altogether too much lumber is stained and very indifferently handled.

Again, what may be regarded as extremely wasteful manufacturing methods obtain in nearly all localities. A manifest improvement will surely come about in lumber manufacture and handling methods before any considerable profits can be attained in lumber production. This observation is made advisedly, regardless of the fact that the stumpage cost for timber holdings belonging to these various companies was obtained at a remarkably low price.

Spokane is the commercial center of large lumber manufacturing interests. Surrounding it is a vast empire of timber and agricultural lands. There are several important sawmill plants in the city itself. This is the headquarters of the Western Pine Manufacturers' Association, the secretary of which is A. W. Cooper, a Forest Service graduate, who is as generous with his time and information as Secretary Boorman over at Kalispell. I am deeply indebted to him for a multitude of courtesies, and the pleasure of a conference with more than a score of the leading members of his association.

The lumbermen out there come to association meetings. A little hike of two hundred and fifty to three hundred miles seems to be as nothing to them. They make a trip of this sort with as little thought of effort as a Chicago lumberman would in dropping around the corner for a highball. The lumbermen out in the West work on the "team" plan. They regard anything that is good for the individual lumberman good for the total of the interests. They exchange information and play fair with each other. They are getting there.

At Spokane I stopped at the big hotel bearing the name of the city, and I coaxed Mr. Cooper over to have lunch with me the day after my arrival, and it was here I encountered a surprise. By the merest accident, of course, Cooper and I drifted through the men's cafe on our way to the dining room, and naturally stopped at the bar for an Appolinaris. Mr. Man at the right of us observed to the chemist behind the bar, "Give me a Gibson cocktail." Mr. Man at the left, with equal insistence said, "Give me a Gibson," and inside of a minute there was a fusillade of "Give me a Gibson cocktail," from a dozen sources.

First I regarded this thing as a joke that had been put up on me by either Bolling Arthur Johnson, Leonard Bronson or J. E. Rhodes, but my curiosity was aroused, and so I changed my order to a "Gibson," which resulted in the discovery that a Gibson cocktail under the western classification is simply what is known in the East is an "extra dry Martini,"—one-half a slug of dry gin and an equal amount of French vermouth stirred up over a chunk of ice. I still think that Johnson or someone of the bunch is responsible for this nomenclature, but it is a certainty that I found Gibson cocktails the vogue from Spokane to Seattle, and clear down the length of the Pacific coast to San Diego. It may be possible that they are the vogue in lower California also, but I stopped before crossing the Mexican border, and therefore can't tell for a certainty.

The Spokane hotel is a pretty good bluff of a hotel for any land, but still these people are building a bigger one to supply the demand for additional accommodations, and are proposing to build one that will be an eyeopener.

When you get within a hundred miles of Spokane you will hear the natives and traveling men all talking about the wonderful restaurant of Spokane—Davenport's. Davenport's is regarded as the gastronomic Mecca of western Washington. You are told

of this marvelous eating resort, about its splendid interior, faultless cooking, service, game, and all this sort of thing. As a matter of fact Davenport's is about as garish a joint as you would find on Sixth Avenue in New York, and it is manned by a bunch of expatriated hack drivers disguised as waiters, with a sprinkling of Greek brigands. It is just a pretense for good food, good cooking and good service. It is a monumental bluff of pretense and imitation of first-class metropolitan restaurants. Still, Davenport's is the ultra-fashionable haunt of Spokane.

In theatrical parlance, the Inland Empire country is referred to as the "alfalfa circuit." I think it should be denominated with more appropriateness as the "willow plume circuit." I know I'll get myself disliked for the observation, but the disease known as the willow plume originating in Paris and brought over to New York some five or six years ago, is in its most aggravated form in Spokane and surrounding cities. Women wear substantial, common-sense shoes, and long, parti-hued woolen coats, but ninety per cent of them are addicted to these appallingly big flat hats,—a cross between an umbrella and the roof of a summer house—which are loaded down with masses of feathers. I walked past the open portiers of a dining room in which was being engineered a ladies' tea fight by Spokane's elect womankind one day. I didn't see any ladies—not even the tip of one nose. It was a billowy mass of feathers akin to the foam of the surf at Atlantic City. One night I sat at the theater between two of these appalling headgears, the rims of which lapped at least a foot across my knees, when the center sections were held on the laps of the ladies at my right and left.

I had the pleasure of a very delightful visit at several of the big mills at Sand Point, Idaho, and vicinity. I made one stop at North Yakima, Wash., about midway between Spokane and Seattle. North Yakima is another typical, well-ordered little city, in the center of the great apple-growing region. There is one big sawmill plant there, that of the Cascade Lumber Company, a modern and up-to-date plant manufacturing quite largely what is known as western pine. However, the name "western pine" doesn't spell anything to the uninitiated. "Western pine" is *Pinus ponderosa*, the yellow pine of the West masquerading under various names in various sections. It is a growth which starts in just north of the city of Mexico, and in various qualities extends clear to the arctic circle, and also has a considerable growth in California. In Mexico it is known as Mexican white pine; in Arizona as Arizona pine; in New Mexico as New Mexico pine; in the Inland Empire as western pine, and in California as California white pine. Depending on soil and latitude, it varies considerable in quality, but the sapwood makes a most excellent imitation of white pine, and is used as a substitute both locally and through the entire East in the manufacture of doors, sash and interior finish.

I am indebted to A. H. Huebner, of North Yakima, manager of the Cascade Lumber Company, not only for a pleasant visit at his big plant, but also for sundry specimens of the apple orchard product of that region, which I buried most religiously in my grip and ate one apple a week through the remainder of my journey, and finally succeeded in getting one monster specimen back to deliver to my wife in Chicago. The Cascade Lumber Company's plant is a good one and very well handled, and while perhaps it negotiates its drying problem of western pine as well as the best, there is still improvement that should be made.

Don't forget for a minute that there are boomers in the land in the Inland Empire. They are just as numerous and busy as further westward. Talk about the living embodiment of the circus poster—they're it.

The California land barker, pestiferous as he is, is a babe-in-the-woods beside some of these Inland Empire fellows—and don't forget that the former is no slouch.

Then I went to Seattle, where Proctor Knox's alluring forensic story of Duluth is duplicated. But as Kipling says, this is another story.

H. H. GIBSON.

Meeting of Box Manufacturers

The National Association of Box Manufacturers met in the fourteenth annual convention at the Hotel La Salle, Chicago, February 19 to 21 inclusive. There was an attendance of approximately one hundred box manufacturers. Unusually close attention was paid to the addresses and discussions occurring in each session and all the sessions were marked by a large attendance.

The opening session of the first day was introduced by F. M. West, president. Mr. West gave a short talk and then introduced L. E. McGann, commissioner of public works of Chicago, who delivered an address of welcome representing Mayor Harrison.

Following a short talk by B. F. Masters, President West delivered his annual address, in which he gave a general resumé of the year's work. He spoke encouragingly of what had transpired during the last twelve months and of future prospects.

Following the report of the treasurer, which showed the finances of the association to be in good condition, Secretary E. H. Defebaugh gave his annual report. He further reviewed the work of the past year and told of the possible benefits from attendance at the conventions, pointing out particularly the good that can come from co-operative action on the part of the members, which can be secured only by getting together. One of the most pertinent proofs of the efficiency of association work, according to the secretary, is the satisfactory prices being realized for boxes. Without the knowledge of general conditions which every member secures from association attendance, such uniformity of prices could not be maintained. In speaking of the matter of substitution of fibre boxes for wooden boxes, Secretary Defebaugh said that the number of claims in the railroad claim offices is incontrovertible evidence that for long hauls the fibre container is inadequate. According to the speaker, it is necessary to convince the wholesale consumer that he reaps an advantage from goods shipped in wooden containers as against goods shipped in fibre containers and that with this advantage he can afford to charge additionally for the goods received packed in wooden boxes. The secretary stated that this persuasion is a matter of salesmanship and that salesmen should be instructed to make every effort possible to convince the wholesale consumer that he is getting better value for goods received in sound condition and that he should be willing to pay a slightly increased price.

H. B. Maxwell, association manager, reported on the accomplishments of the association during his term of office. He spoke particularly of proceedings in the R. W. Pridham case. This case, it will be remembered, was with the idea of securing the same classification on goods packed in fibre packages shipped to the East as at present prevails on similar goods shipped to the West.

The nominating committee submitted the following names as its recommendations for officers for the coming year:

PRESIDENT: W. D. Sexton, Cincinnati, O.
FIRST VICE-PRESIDENT: W. F. Brown, Jersey City, N. J.
SECOND VICE-PRESIDENT: F. S. Blodgett, St. Paul, Minn.
THIRD VICE-PRESIDENT: J. W. Jarboe, St. Louis, Mo.
SECRETARY: E. H. Defebaugh, Chicago, Ill.
DIRECTORS: Bert Hanna, G. L. Crosman, John A. Cook, W. L. Russell, T. H. Ellenberger, H. E. Montgomery, E. E. Fair.

The committee on uniform cost system reported through its chairman, B. F. Masters. The report was followed by considerable discussion and it was finally moved that discussions be continued at the next meeting of the association. This would give the members ample opportunity to digest the contents of the committee's report and to form their opinions.

At the Thursday session R. S. Kellogg, secretary of the Northern Hardwood and Hemlock Manufacturers' Association, gave a talk showing the connection between the hardwood lumber industry and the manufacture of boxes. Mr. Kellogg assured the members that there is no immediate prospect of there being any immediate break in the price of box lumber. His statement in this particular was received philosophically by the members of the association and a discussion of the question established the fact that the con-

sensus of opinion of the members is that an increase in the price of boxes is the only solution of the problem. In fact, there was considerable evidence in the discussions which would indicate that box manufacturers are now getting considerable increase in price for their product. Several members expressed themselves as believing that even with the increased price of box lumber their plants will return a satisfactory profit during the coming year. Other men prominently connected with the lumber business who gave their views on this same question were F. E. Parker, president of the National Wholesale Lumber Dealers' Association, J. E. Rhodes, secretary of the National Lumber Manufacturers' Association, and J. M. Goodwillie, prominent box manufacturer of Chicago.

The committee on uniform classification then reported through its chairman, J. E. Williams. In conjunction with this report was a report of the committee on standardization of the wooden box. The reports and following discussions treated fully of the question of the superiority of the wooden box as a shipping container. A most important phase of the discussion was that having to do with the possibilities of the railroads and the box interests working out a standard for boxes which would result in the continued acceptance of the wooden container as the superior of all shipping containers.

Harry A. Wheeler of Chicago, president of the Chamber of Commerce of the United States, spoke enthusiastically to the attendance of the possibilities of the association he represented. Mr. Wheeler outlined what has been done by the National Chamber of Commerce, told what it is now trying to do and of the future possibilities. He spoke of the increased benefit which would result from increased and continued support on the part of the business men throughout the country through increased membership.

C. W. Price, representing the Industrial Commission of Wisconsin, gave an interesting and instructive talk on the prevention of industrial accidents. He analyzed the causes for the usual class of accidents occurring in industrial plants and pointed out practical methods of preventing such catastrophes. Mr. Price had arranged with the visiting delegates at the convention to visit the headquarters of the Lumbermen's Club of Chicago, where there is on exhibition a complete line of accident preventing appliances. The exhibit contains photographs of every known practical device for the prevention of accidents which can be applied to woodworking machinery of any kind. These photographs were taken from appliances now in successful operation and represent practical ideas rather than merely the theory of accident prevention. The photographs are supplemented by working models of the devices wherever it was possible to exhibit them.

The session Friday, February 21, was mainly executive in character. Following the executive discussions the committee on officers' reports reported. These reports were adopted. The committee on resolutions submitted resolutions on the deaths of the following: Frank Halleck of the W. S. Doig Estate, Brooklyn, N. Y.; Mrs. Henry Stevens, wife of Henry Stevens, formerly manager of the box association; R. B. Dyer, president of the Northwestern Association of Box Manufacturers; W. F. Goessling, St. Louis, Mo.; Edward Germain of Saginaw, Mich. The committee also recommended that votes of thanks be extended to the hotel, to the members of the Chicago trade entertaining the visiting delegates, to the speakers, the officers and the Wisconsin Industrial Commission.

The election of officers followed, the recommendations of the nominating committee being adopted.

The entertainment included luncheon for the ladies at the South Shore Country Club Thursday noon. The ladies also attended a dinner and theatre party Thursday evening. At the same time the men were enjoying a banquet and entertainment in the roof garden of the La Salle hotel.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the Inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 398—Bleaching Wood

Saginaw, Mich., Feb. 14.—Editor HARDWOOD RECORD: We are referred to you by Harry D. Tieman, in charge of the Forest Products Laboratory at Madison, Wis., to whom we had directed an inquiry with regard to bleaching wood.

We have met with a process of bleaching hardwood that removes all sap and stain and natural color, leaving it a pure white. We are under the impression that this is not a new process and we would like to have you advise if you have met with any literature or advertising on the subject.

The above concern has been advised that the only process that we know anything about for bleaching wood is involved in that which is known as the sulphur fume process. Sections of light colored lumber or veneer can be suspended on wires by means of clothespins or their equivalent in a tight box and by sifting a handful of sulphur over live coals in an iron pan or kettle, the surface of woods like maple can be bleached to a very white tone.

Mr. Tieman probably had in mind the Kraetzer process of steaming wood under pressure to contribute to its quick and accurate seasoning. This process simply tends to make the color and tone of wood more uniform, but does not change the color of woods that contain no tannic acid. Woods that are rich in tannic acid, like red gum, red oak, sycamore and mahogany, are materially darkened by this process; and it is possible by treating wood in steam under pressure for a considerable period to render white oak, for example, rich brown in color, and carried far enough, will vulcanize the wood.—EDITOR.

B 399—A Correction

Port Barre, La., Feb. 15.—Editor HARDWOOD RECORD: The copy of your issue of February 10 received. The article you published in regard to The St. Landry Realty Company is correct in every particular with the exception that it has not purchased any timberlands from the Port Barre Lumber Company. Its timber lies in a different section of the country altogether.

This is rather doing an injustice to the Port Barre Lumber Company, and will ask you to kindly correct it in your next issue and oblige.

THE ST. LANDRY REALTY COMPANY.

B 400—Wants Butternut

Rock Falls, Ill., Feb. 13.—Editor HARDWOOD RECORD: Cartier-Holland Lumber Company, Ludington, Mich., suggests that you could likely advise me as to any firms manufacturing butternut. I want a carload of 4/4 and 6/4 firsts and seconds and No. 1 common, on grade. If you can give me any information on this line would appreciate the favor.

The above inquirer has been supplied with a brief list of manufacturers of this wood, who possibly will be able to supply it.—EDITOR.

B 401—Percentage of Moisture in Kiln-Dried Oak

Jackson, Mich., Feb. 10.—Editor HARDWOOD RECORD: Will you advise me what is the percentage of moisture left in oak after it has been through the average kiln? This question was asked me by a varnish man.

The above correspondent has been informed that oak which has passed through an ordinary dry kiln retains probably more than five per cent of its weight in water. Capillary attraction in the wood is so strong that no heat short of burning will compel it to give up all of its moisture.

Air-drying in a room of ordinary temperature, no matter how long continued, still leaves in the wood enough water to weigh from eight to ten per cent as much as the wood.—EDITOR.

B 402—In the Market for Elm

Chattanooga, Tenn., Feb. 5, 1913.—Editor HARDWOOD RECORD: We are in the market for two or three carloads No. 1 common and better, elm, 15", 16" and 17" wide, thoroughly dry. Can you advise where this stock can be had?

A list of manufacturers of southern elm has been forwarded to the Chattanooga inquirer.—EDITOR.

B 403—Evidences of Interest

As proof that it pays to take time to read a legitimate trade paper, HARDWOOD RECORD submits the three appended communications coming respectively from a manufacturer of beds, a prominent wholesaler in the East, and a manufacturer of shuttle blocks. These men found in the last issue of HARDWOOD RECORD ideas which appealed to them as being practically valuable in connection with their business.—EDITOR.

New York, N. Y., Feb. 14.—Editor HARDWOOD RECORD: In the last issue there was an article entitled "New Zealand Hardwoods Might Prove Satisfactory in America." We desire further information and would like to know to whom to write for the same. We should like to get the names of the woods which compare nearest to hard or rock maple, beech and birch and rock elm. We would then want to import a sample lot.

—————COT BED COMPANY, INC.

Philadelphia, Pa., Feb. 15.—Editor HARDWOOD RECORD: I find in your issue of Feb. 10 an article on page 34 entitled "Personality in Salesmanship." This is one of the best articles that I have ever read and if all the lumbermen would read the same, I know that they would be greatly benefited.

The lumber business today is more or less like a race-track, one salesman merely trying to go faster than the other, without really considering the actual outcome of his labor. In other words, it seems to be a case more of volume than of profit and, while I believe that competition is the life of trade in many instances, competition is the death of trade as explained.

I also must admit that the personality of a salesman is a great factor, but that personality must be his integrity and truthfulness and fair dealing with his customers. It is not the number of salesmen that are on the road that counts, but the success of a business depends upon the character of its representatives whose aim should be to make a fair margin for those they represent. Such men are hard to get as frequently such men consider themselves capable of going into business for themselves.

As stated above, I wish it were possible for every lumberman to read this valuable article.

—————LUMBER COMPANY.

Greensboro, N. C., Feb. 15.—Editor HARDWOOD RECORD: Your article on page 34b, Feb. 10 issue, entitled "Useless Hardwoods Will Have Value," was very interesting. The gum you spoke of has been tried by the writer for shuttle manufacture and it was found that it will warp and check. As to the other woods you mention, it will be interesting to note how they will perform in service. My idea would be that the quebracho would answer very well. Can you advise me where I can get a sample of the wood?

B 404—In the Market for Beech

New York, N. Y., Feb. 15.—Editor HARDWOOD RECORD: We are in the market for some 5/8" No. 1 common and firsts and seconds beech and if you can put us in touch with some mill who can furnish same, we will appreciate your attention.

—————LUMBER COMPANY.

While it is recognized that this is a particularly hard item to secure under ordinary conditions, and especially hard under present conditions of stock, it may be possible for this concern to fill its requirements. It has been given a list of possible producers of this grade of stock.—EDITOR.

B 405—Wants Three and Five-Ply Panel Stock

Chicago, Feb. 18.—Editor HARDWOOD RECORD: Please put our name on your bulletin service as we are in the market for three and fiveply panel stock in beech, oak and mahogany and also for 1/8" oak and birch door stock. Kindly see if you can not find some firms who can supply us with the above stock.

—————VENEER AND PANEL WORKS.

B 406—Wants Stock for Packing Cases

New York, N. Y., Feb. 22.—Editor HARDWOOD RECORD: Can any of your readers quote on, or inform me where I may obtain, a considerable quantity of any kind of softwood, sound knotted stock suitable for packing cases, 5/8" or 9/16" thick, 5 to 10" wide, some 3 and 4" taken, 5 to 10' long, bundled and marked for export, giving price delivered at nearest port? Can use three to four cars monthly. This is a steady business throughout the year. May be resawed stock. Must be wood grown in this country.

The above inquirer has been supplied with a list of several manufacturers of crating lumber.—EDITOR.

A prominent railroad in New England is re-trying the experiment of preserving crossties by boring a hole through the middle and filling with oil which can be renewed from time to time. The hole in each is an inch and a half in diameter and extends to within six inches of one end of the tie, the open end being plugged after the oil is put in.

News Miscellany

Coming Annual of the National Wholesalers

All reports indicate that the annual meeting of the National Wholesale Lumber Dealers' Association, to be held at Atlantic City on Thursday and Friday, March 6 and 7, will be one of the largest conventions ever held by that association. Arrangements are being made by members in several cities to engage special cars, and it is very evident that the decision of the trustees to hold the meeting this year at Atlantic City meets with the very hearty approval of the association members.

Arrangements at the Hotel Chelsea, which is to be the headquarters of the association during the meeting, are the most complete ever made for a convention. The floor plans of the hotel are such that the meetings can be conducted on a very convenient and expeditious basis, the convention hall being on the first floor right off the lobby, while the various committee rooms, smoking room, etc., provide a most suitable meeting place. The executive committee is working out a program for the convention and the banquet which is to be held on Friday evening, March 7. Speakers of prominence will attend the banquet. The replies from manufacturing, wholesale and retail associations show that the association and delegate attendance will be unusually large. The ladies will also participate in the banquet.

Several important subjects will be considered at the business meeting and the combination of business and social arrangements is one that will be unusually pleasing to the members and delegates.

Forestry Matters in North Carolina

The third annual meeting of the North Carolina Forestry Association, at its meeting in January, passed resolutions by which it declared its attitude on several important matters of policy.

The state was urged to co-operate with the federal government in protecting the forests on the headwaters of the principal rivers.

The movement to turn over government timberlands to the state in which they are situated was strongly disapproved, and members of the United States Senate and House of Representatives were asked to use their best efforts to defeat it.

Better means were advocated for the protection of the forests in the state against fire, and an increase in the appropriation was asked for that purpose.

The time-honored custom in the South of ranging stock in the woods is severely criticized. "Hogs and cattle," it is declared in the report, "are preventing the reforesting with longleaf pine of vast areas of cut-over forest land in the eastern half of North Carolina." The association recommended a stock law that would put a stop to the unrestricted ranging of cattle and hogs.

The movement for establishing a chair of forestry in the State University was endorsed by the association.

Activities of Memphis Lumbermen

Red gum will be used as the interior finish in the new Chelsea hotel, which is being erected here and which is to be one of the largest structures of the kind in the city. The management first decided on birch, but as a result of the activity of the special committee appointed by the Lumbermen's Club the specifications have been changed from birch to red gum. The latter is to be quarter-sawn and is to be used in its natural color, with the result that it is expected that it will prove quite an advertisement of the beauty and utility of this lumber. The special committee, of which F. B. Robertson is chairman, made its report at the meeting of the Lumbermen's Club, held at the Hotel Gayoso, Feb. 15, and the success of the work of this committee was the source of much gratification to the members, particularly to those who are prominently identified with red gum, either through ownership of gum timber or through operation of plants manufacturing this lumber. It was necessary for the club to agree that the management of the hotel should not experience any loss as a result of the change in the specifications, and this was done. It is not known what the difference in cost will be, but the club is sending a representative to Oshkosh, Wis., to go over the matter with the firm at that point which had the original contract specifying birch. There is a vast amount of gum timber in the Memphis territory and the success of the committee in this instance is accepted by members of the trade here as one of the most important steps taken in the educational work being done in behalf of that particular wood.

The law and insurance committee, through James E. Stark, reported that further investigation had disclosed the fact that fire insurance rates on lumber in Memphis were not only higher than at points north of the Ohio river but that they were higher than those at Nashville and St. Louis. Mr. Stark has gone very thoroughly into this matter, and the further he goes the more convinced he is that rates here are entirely out of line and that they are so excessive that a decided adjustment is necessary. He and the members of his committee held a conference during the past week with a representative of the Tennessee Inspection Bureau but, while a number of propositions were made, none was satisfactory. Mr. Stark had a vast array of figures which he submitted to the club bearing out his contention that rates here are not only too high but that they are distinctly out of line with those on similar risks

at other points. Mr. Stark also introduced to the club a gentleman who has been identified with insurance matters and who declared it to be his opinion that the insurance companies could make substantially lower rates at Memphis and still get away with a good profit. The committee will continue its efforts to secure lower rates, and indications are that the matter will be handled so vigorously that something definite in the way of results will be obtained.

The river and rail committee called the attention of the club, through John W. McClure, to the fact that the Illinois Central Railroad Company had agreed to temporarily withdraw the proposed increase of two cents per hundred pounds on shipments of cottonwood and gum from Vicksburg, Cedar Point and one other station in Mississippi to Memphis. This withdrawal is effective until May 1, when the Illinois Central proposes to put in increased tariffs on all hardwood shipments of lumber from points in Louisiana, Arkansas and Mississippi to Memphis. Mr. McClure states that the shippers of hardwood lumber were represented at the hearing before Special Examiner Elder of the Interstate Commerce Commission Feb. 13, at which time the Illinois Central made this announcement, by J. H. Townsend, manager of the Southern Hardwood Traffic Bureau, and J. R. Walker, special attorney for that organization. The hardwood men did not attend and did not give any testimony because this hearing, it was stated, dealt almost altogether with pine.

The club, on recommendation of the river and rail committee, instructed the secretary to request the Tennessee senators at Washington to support the confirmation of the reappointment of Mr. Clark of the Interstate Commerce Commission.

Among the guests at this meeting was Special Examiner Elder of the Interstate Commerce Commission. Mr. Elder addressed the club and said that, while this was his first visit South, he was very favorably impressed with Memphis. He complimented the lumbermen in particular upon the good feeling which existed among them and which enabled them to combine themselves into such a formidable organization for the protection of their mutual interests. By virtue of his connection with the commission Mr. Elder has had an excellent opportunity to witness the results which have followed the organized efforts of the lumbermen of this section in connection with rate and other problems.

This meeting was well attended and was of particular interest, owing to the number of subjects which came up for discussion. The attendance was large. The usual luncheon was served.

Philadelphia Exchange in Monthly Meeting

The Lumbermen's Exchange held its regular monthly meeting on Feb. 6, President William T. Betts in the chair. After the usual luncheon, a regalement of another sort but of equal relish was furnished by Owen M. Bruner, president of the Philadelphia Wholesale Lumber Dealers' Association who has recently made a trip to the Panama canal, of which he made a thorough inspection, and of which wonderful construction he is well equipped to give an entertaining description and to expatiate exhaustively upon its wonderful advantages to a universal traffic. He illustrated this great work by the aid of moving pictures. This was a treat for which those present feel much indebted to Mr. Bruner. Views of some of the immense lumber camps and timber tracts in Idaho and Washington, and of other interesting Pacific plants were also given. By a neat little trick of Mr. Bruner, as a closing view, President William T. Betts and George A. Howes, appeared in bold relief on the sheet to the excessive mirth of the audience.

At this meeting J. E. Troth, in behalf of Ralph Souder, chairman of the committee on legislation, submitted a report in which the committee recommends that the exchange endorse the bill asking for the repeal of the mercantile tax, which request was made by the joint committee on repeal of mercantile tax, Pittsburgh. The exchange concluded to do this. It also endorses the endorsement of the Alter bill, in the Pennsylvania General Assembly, in Harrisburg, against fraudulent advertising, notifying the Pittsburgh Publicity Association to that effect. A bill in the House of Representatives, Washington, for the purchase of a site on which to begin the construction of a new custom house in the city of Philadelphia was in resolution endorsed by the exchange at this meeting. The American Academy of Political and Social Science, Philadelphia, sent a request that delegates to represent the exchange be sent to the Seventeenth annual meeting, to be held on April 4 and 5. The six sessions of this annual meeting will be devoted to "The cost of living in the United States." President Betts, was instructed to appoint delegates.

Timber Purchase

J. C. Turner, the well-known cypress man of New York, has just purchased 24,000 acres of cypress and tupelo gum timber near Mobile, Ala., from the Mobile Timber Company. The tract cruises about 350,000,000 feet. Mr. Turner expects to begin to operate this timber sometime during 1914. This is only one of the many enterprises in the Gulf coast region in which Mr. Turner is interested.

February Edition Red Book

The Lumbermen's Credit Association, Transportation building, Chicago, publisher of the Red Book, has delivered to its subscribers the February edition giving ratings and financial standing of lumber concerns throughout the United States and several provinces of Canada. This concern, of which William Clancy is the head, has been in business since 1876, and aside from printing the Red Book and issuing reports on the lumber trade, it also has a law and collection department.

Meeting of St. Louis Lumbermen's Exchange

The Southwestern rate case was the principal topic touched on at the first meeting and dinner of the Lumbermen's Exchange, under the administration of the newly elected president, F. H. Smith, which took place at the Mercantile Club, on Friday evening, Feb. 7. There was a good attendance.

President F. H. Smith, called the business meeting to order and asked Charles E. Thomas, chairman of the traffic committee to report on freight rate matters. Mr. Thomas spoke of the proposed advances from the Southwest, telling how comprehensive they were, how the contemplated changes have caused the lumber interests of Cairo, Memphis, and other cities, as well as the Lumbermen's Club to take action. He stated that the advances were a far reaching scheme for other rate advances from the South. He also mentioned that most of the money necessary for the expenses in presenting the case to the Interstate Commerce Commission, had been raised or pledged.

Harold Small, an attorney, who has been retained to conduct the rate advance case before the Commission, then discussed the various phases of the freight rate situation.

H. A. Boeckeler, Thos. E. Powe, G. H. Cottrell and Geo. E. Hibbard also spoke on the subject.

George E. W. Luehrmann, chairman of the fire insurance committee although not at the meeting, sent word that considerable progress had been made by his committee and a report would be handed in at the next meeting.

National Inspection for January

The January statement of inspection issued by the secretary of the National Hardwood Lumber Association shows that during that month 13,599,434 feet of hardwoods were inspected under the bonded certificate. This is an increase of 3,818,603 feet over January, 1912, and was accomplished at an expense of \$191.94 in excess of inspection fees earned. Floods and unfavorable weather conditions at many southern points materially reduced the volume of work.

Since the letter of Jan. 17, five new applications for membership were received, which makes the total since the convention of last June, ninety-five.

The sixteenth annual convention will be held in Chicago June 5 and 6 at the Hotel Sherman. The attention of all members is directed to section 2, article IX, of the by-laws. During the coming month, the recommendations of the inspections rules committee which will be voted upon at the convention on June 6 will be printed and a copy sent to every member. Proposed changes in the inspection rules must be sent to Chairman J. M. Pritchard, Memphis, Tenn., prior to March 5.

R. L. Dooley has been appointed as assistant to inspector H. H. Roberts at Huntington, W. Va., and I. O. Burdette succeeds O. L. Faust as assistant deputy inspector at Memphis.

Biltmore Doings for January

Jan. 2 brought the students of the Biltmore Forest School together at Darmstadt in Germany after the Christmas holidays. The students spent the entire month in Darmstadt.

During January a number of short trips were taken to the forests and wood utilizing establishments in the immediate vicinity of the school's headquarters. The students were enabled to study and observe the gradual increase in the intensity of forest management as it developed with the gradual welding together of the many small principalities which eventually, in 1871, formed the German empire as we know it today.

On Jan. 6 the students paid a memorable visit to old Heidelberg and while there visited the communal forests under the guidance of the supervising forester. Here were encountered some fine stands of chestnut grown from natural seed regeneration on steep hillsides. Chestnut here suffers from wind-shake and is utilized chiefly for its tannic acid and for staves of brandy barrels.

The Balkan war has influenced forestry even in Heidelberg, for the supervising forester is selling the box board quality of pine to be used for ammunition boxes at a price of thirty dollars per cord.

A visit to Mannheim, the terminus of the commercially navigable Rhine, was made particularly pleasant by members of a local firm of timber merchants. Most of the lumber imported comes from Sweden, Norway and Finland, with the United States a poor fourth. This situation will undoubtedly be changed with the opening of the Panama canal. The principal lumber imported from the United States is longleaf pine. Douglas fir is imported to some extent, but there is a prejudice against it, the trade saying that it is too soft for flooring, for which purpose it is chiefly used.

The students made a trip to the plant of the leading German manufacturer of woodworking machinery. Here the points of difference be-

tween American and German woodworking machines were pointed out and explained. The German machine is, generally speaking, more solidly built, and usually has to accomplish a variety of purposes. Among the recent inventions of this firm is a planer which planes the inside of a finished barrel so as to prevent the spoilation of the liquids due to microbes and fungi harbored on the uneven surfaces. A slack stave machine will finish at one operation, from lumber of uneven widths, 20,000 staves a day.

The students have been busy during their days spent at Darmstadt in lumber inspection on yellow poplar, cypress, cottonwood, gum, oak, hickory, sycamore and maple. The school had a considerable quantity of American lumber shipped to it by a large American manufacturer.

Opens Wholesale Office at Cleveland

George N. Comfort, formerly secretary of the Central Lumber Company of Cleveland, O., recently resigned his position with that concern after having been with it for six years, and disposed of his interest in order to enter the wholesale lumber business on his own account. Mr. Comfort has opened offices at 568-70 Rockefeller building, Cleveland. While he will do a general wholesale business, he expects to specialize in northern hardwoods, white pine and other northern woods.

Mr. Comfort started in the lumber business in 1900, being employed at that time by F. W. Gilchrist at Alpena, Mich. Shortly afterwards, he was transferred to Cleveland, taking charge of the company's wholesale pine and hardwood yard operated at Cleveland under the style of F. R. Gilchrist & Co. He was with this company until it sold out, then took a position with the Robert H. Jenks Lumber Company, being department manager for this concern for three years. At the end of that period, the Central Lumber Company was organized and Mr. Comfort was elected secretary. He resigned that position on Feb. 1. Mr. Comfort will operate under his own name.

Switching Controversy in Baltimore

Switching charges, for a long time one of the troublesome questions for Baltimore shippers, are once more engaging the attention of those firms and corporations who receive or send out freight in carload lots. Some time ago the matter was taken before the Interstate Commerce Commission on the plea that the charges made by the Baltimore railroads were altogether out of proportion to the value of the services rendered, and greatly in excess of the rates exacted for a similar service in other cities, thereby putting the Baltimore merchants and manufacturers at a serious disadvantage as compared with their competitors in other cities. The Interstate Commerce Commission, after a hearing, granted partial relief, it having been shown that while the charges were relatively low for switching from one point on a railroad to another point on the same road, they increased disproportionately where the switching was from a point on one road to a point on another road. In some instances the charge for switching a car within the city limits amounted to one-half the freight rate from Baltimore to Pittsburgh. The order of the Interstate Commerce Commission did not go far enough, in the opinion of the shippers, and they appealed to the Maryland Public Service Commission, which, after another hearing, issued still further regulations, wherein the contentions of the shippers were practically sustained. Now the railroads have appealed to the courts for an order to vacate the decree of the Public Service Commission, and the case has been up for a hearing in the Circuit Court here for the last two days. The railroads maintain that the order of the State Commission is unfair to them, that they have expended much time and effort to the end of being first on the ground in the matter of terminal facilities, and that they should not be required to afford the use of these facilities to newer roads. Under the order of the commission, the switching charges were reduced to \$1 a car for ordinary yard switching, and proportionate amounts up to \$7.50 for a more complicated service. The members of the lumber trade here are greatly interested in the outcome of the case, since they are among the shippers who frequently have cars transferred from one point to another in the city, to meet the special requirements of their trade, and they have in times past been compelled not infrequently to sacrifice a large part of the profits by the payment of switching charges, which they considered exorbitant.

Forestry Students on Utilization Trip

The senior class in forestry of the Pennsylvania State College has just completed a forestry utilization trip in north central Pennsylvania, under the direction of Professor R. R. Chaffee. A very interesting visit was paid to the state nurseries in Tioga county. The students also visited various industrial plants, including a basket plant, a hardwood distillation plant, a chemical wood products plant, a tannery and a stave plant.

GEORGE N. COMFORT, CLEVELAND, O.

Special trips were made to the woods operations of the Emporium Lumber Company and of the Central Pennsylvania Lumber Company, where the students were allowed to make a complete study of the hardwood and hemlock timber and the logging and milling operations in the central Pennsylvania region. During the stay at Galeton, the students were privileged to listen to lectures by U. B. Russell on the "History of Lumbering in Northern Pennsylvania," by F. P. Sykes, woods superintendent of the Emporium Lumber Company, who talked on "Portable Sildes and Their Economic Features," and by W. W. Lowell, mill superintendent of the Central Pennsylvania Lumber Company.

On the return trip, the class visited various plants including a paper mill and various sawmills.

A Combination Interesting to Lumbermen

On Feb. 10 it was announced that Elmer H. Adams, Asa G. Adams, Ralph Crews, D. S. Bobb and James E. Wescott had formed a co-partnership for the general practice of law. The co-partnership will do business under the firm name of Adams, Crews, Bobb & Wescott, and will be located on the eleventh floor of the American Trust building.

The members of this firm have for some time been known for their practical knowledge of the lumber business and their ability to successfully represent lumbermen in legal matters. Elmer H. Adams particularly has been actively connected with the lumber business and in fact is now associated with other lumbermen in a hardwood operation in Arkansas.

Annual Meeting Grand Rapids Concern

The board of directors of the A. L. Dennis Salt & Lumber Company, with headquarters at Grand Rapids, Mich., held its annual meeting on Feb. 8, at which the following officers were elected: A. L. Dennis, president; Edward Fitzgerald, vice-president; Earl L. Crossman, secretary; Henry Irema, treasurer.

Inquiry on Freight Bills

Under date of Feb. 13 the Interstate Commerce Commission issued from Washington an inquiry the purpose of which is as follows:

For the purpose of determining whether the rules, regulations and practices in connection with the issuance of form and substance of receipts and freight bills are unjust, unreasonable, unjustly discriminatory, unduly preferential or otherwise unlawful, and taking such action in connection with said receipts or freight bills as may be authorized by law to prevent further violations of the provisions of the aforementioned statute [act to regulate commerce], should any violation be disclosed by said investigation, and particularly for the purpose of determining whether the freight bills or receipts shall include, with respect to the shipments covered thereby, the following:

1. The point of origin.
2. The date of shipment.
3. The correct weight of shipment.
4. The route, including the name and initials of each carrier participating in the haul, and the junction points through which the shipments moved.
5. The initials and number of the car.
6. Adequate description of the property transported.
7. The rate or rates applied to the transportation.
8. A statement of the nature, amount, and point of accrual of each item of charge for stop-in-transit, reconsignment, switching, car service, storage, or any other charge incident to the transportation.
9. Where such bills are presented to the consignee they should also show the name of consignor, and date of arrival of shipment at destination.

The result of the inquiry will be the issuance of necessary orders bearing on the question of freight bills.

Forms New Company in Philadelphia

The Hoban Lumber Company has been incorporated at Philadelphia to do business in southern hardwoods, maple flooring, hemlock, yellow pine, timbers, size, flooring and roofers. George M. Hoban and R. C. DaCosta are the principals in the new company. Mr. Hoban was secretary and director of the Carolina Lumber Company of Philadelphia up to Feb. 15, at which time his resignation was accepted by that concern. Mr. Hoban is a brother of J. E. Hoban of the Hoban-Hunter-Feitner Company of Brooklyn, N. Y. He has had an extensive experience in handling long and short leaf pine as well as hardwoods in the East.

English All the Go

The demand for English furniture and furnishings in the styles made classic by the early cabinet-makers, still continues strong. The Georgian period, including the work of Chippendale, Heppelwhite and Sheraton, seems most in favor, probably because it lends itself more easily to the uses of the day, probably because it gives the decorator a wider scope in which to exercise his inventive and adaptive genius. The earlier English styles, the Tudor, the Elizabethan, the Jacobean and, in some instances, William and Mary, are reserved for special treatments where the size and character of the room permits them to be used as they should. The small, in the sense of compact, rooms of the modern city apartment are not well calculated to hold the massive four-post beds, mantels and fireplaces, chairs and tables of the Elizabethan and Jacobean type. Such furniture requires unlimited space to be used advantageously. It is interesting to note that the heretofore exceedingly popular Louis XVI. style is giving away to bed-rooms, boudoirs and ball-rooms done in Adam, a style of decoration that is once satisfying and worthy when used aright.

Bill of Lading Rules Protested

The Interstate Commerce Commission was recently in receipt of a petition from the Lumbermen's Association of New Orleans, protesting against recently completed arrangements between steamship lines sailing from New Orleans and the local rail lines. The arrangements had to do with the issuance and treatment of shipments of forest products on through bills of lading from points west of the Mississippi river. It was pointed out further in the petition that shipments on local bills are unjustly discriminated against in favor of shipments on through bills of lading. Under the new arrangement, the shipments on the through bills enjoy certain advantages in the matter of free time allowances, additional time for delivery in rail shipment and similar advantages which the shipper on local bills does not have. It further says: "In legal effect, there can be no distinction between shipments on through and local bills of lading for export and no warrant of law for any different treatment in the matter of demurrage, etc." In the petition, the commission is asked to compel publication by the defendant lines of rules which will effect just and equal treatment to shipments on through bills of lading and on local bills of lading. Special Examiner Marshall of the Interstate Commerce Commission will preside at a hearing of the case, which will take place at New Orleans on Feb. 27.

Will Saw Deadheads

A mill has been erected on one of the dams at Merrill, Wis., in which deadheads gotten from the river will be sawed under contract. The arrangement of the mill is unusual. An upright engine is used for operating the rotary, to which the rotary shaft is attached direct. The carrier is operated by a pinion feed. The mill is also equipped with an edger which, however, has only two saws. A slasher is further provided. The boiler is located a short way from the mill and is supported over the fire by cross-arms. The mill crew consists of only three men.

A Lumber Company the Goat

A well-thought out swindling scheme was recently frustrated when the Chicago police apprehended Claude Knapp and F. L. Tarbell. Knapp had been paroled from the Joliet penitentiary, and two days after the beginning of his parole he opened offices in the Marquette building, Chicago. Knapp's aptitude at figures gave him work in the bookkeeping department at Joliet, and while there he learned that the American Hardwood Lumber Company of St. Louis, Mo., had been selling extensively to the prison. Upon gaining his freedom he immediately had billheads printed purporting to be those of the Chicago branch of the American Hardwood Lumber Company.

Knapp then forwarded to one of his cronies at the prison, a magazine, in the leaves of which was contained a billhead made out for a car of expensive hardwoods amounting to considerable money. The scheme had been worked out beforehand, and the man at the prison end forged the name of the foreman of the department, marked the bill O. K., and placed it with some others so that it went to the bookkeeping department. The warden promptly wrote out and mailed a check for the amount specified.

The hitch came when the American Hardwood Lumber Company actually forwarded the car to the penitentiary from St. Louis and sent a bill. When the first bill arrived the accomplice in the prison managed to destroy it, but the second bill was received by the warden.

January Cut and Shipments Northern Association.

The cut and shipments for January, 1912, and January, 1913, are compared in a statement issued by the Northern Hemlock and Hardwood Manufacturers' Association. The report contains returns from the same fifty-six firms in both instances. It shows an increase in hardwood cut of 59 per cent, and an increase in hardwood shipments of 20 per cent. The increase in hemlock cut is three per cent, and the increase in hemlock shipments 17 per cent. The total increase in cut during the year as noted was 30 per cent, and the increase in shipment during the year 18 per cent.

The total cut of all hardwoods in January, 1913, was 26,253,000 feet and in January, 1912, 16,540,000 feet. Shipments of all hardwoods for the same respective periods were 17,920,000 feet and 14,924,000 feet.

The total cut of hemlock for January, 1913, and 1912, respectively, was 19,049,000 feet and 18,435,000 feet. Shipments for the same respective periods were 26,678,000 feet and 22,822,000 feet.

Bulletin on Sanitation in Industrial Plants

The Industrial Commission of Wisconsin has been attracting considerable attention because of the able way in which it has been getting at the solution of the many problems placed before it in the matter of the relations between industrial employers and employees. It has covered the ground comprehensively in many lines, and its latest effort has involved the publication of a series of bulletins, one of which contains general orders on sanitation.

The bulletin enumerates the provisions for the laws on this subject on the statutes of the state of Wisconsin. It further explains the provisions of the law, and in short, places the matter concretely and clearly before the industrial employers of the state, thus giving them every aid in the matter of carrying out the provisions as ordered in the sanitation act.

Lumber From Blighted Chestnut

"I scarcely cut any blighted timber, and dead chestnut is not worth much to me."

The above quotation is from a reply to an inquiry regarding the use of blighted chestnut timber. It expresses very largely the sentiment of many wood users, as to the value of lumber and other products from chestnut affected with the chestnut tree blight. It seems to be a general opinion that the blighted chestnut is either dead or rotten chestnut. The lumberman or wood user who is not familiar with this disease naturally infers that because it is a "blight" it means dead timber in some stage of deterioration. It is true that where the blight first began its ravages in the northeastern United States, some of the trees which are still standing, after being killed by the blight, are in poor condition for lumber or most other chestnut products. It must be realized that blighted chestnut, in order to have lost any of its merchantable value, must have stood dead on the stump for one or more years after being killed. It is safe to state that blight in itself does no injury to the wood, and does not impair its merchantable value. The blight is a bark disease and may be compared to a skin disease. When it attacks and girdles a tree near the base, it produces much the same effect on the wood as though the girdling were done with an axe. It is only after it has killed a portion or all of a tree, that wood rotting fungi and many insects enter the wood, chiefly where the blight lesions occur and the resulting deterioration is much the same as though death had been caused by any other agency.

The wood of blighted chestnut, if cut and utilized as soon as the disease has attacked the trees, and while still green, or before the trees have been dead as long as a year, is in every respect as good as though cut from a perfectly healthful tree. In the production of lumber, all the effect on the wood which the blight itself is able to produce is entirely removed with the slabs during the sawing operation.

It is impossible to separate lumber cut from blighted chestnut from lumber cut from unblighted chestnut. Blighted chestnut does not mean dead chestnut. The defects in lumber from dead trees must not be charged to blight, since the same defects occur in lumber cut from trees dead from any other cause. In the utilizing of lumber from blighted chestnut, there should be no discrimination and there is no reason why lumber from such trees cannot be used the same as lumber from unblighted trees.

Wood's Strength Increases With Age

The natural impression is that new wood is stronger than old. It has been found, however, in a series of tests that some white pine a quarter of a century old is materially stronger than new wood. Pine is the wood on which the experiments were made, but there is no reason to suppose that oak, hard pine or any other wood commonly used in building would behave differently. All wood maintains its strength, except as decay weakens it or fire and mechanical abrasion destroy it.

It is largely a matter of dryness. It is well known that a wood is much stronger when thoroughly seasoned than when green.

Engineers are already using wood for permanent service where it is kept under water. Its permanent reliability under such conditions is literally a foundation fact in engineering. Wood above water is subject to destruction by fire and decay, but if these two enemies are kept away it is difficult to set a limit to the useful life of timber. There are plenty of wooden truss bridges all through the East, whose structures have been protected from the weather and which have been carrying traffic from fifty to a hundred years. Many people who have traveled abroad will recall noted wooden bridges and other wooden structures of much greater age. In fact, were it not for the increasing cost and scarcity of good timber, there is reason to believe that many country highway bridges of moderate span and light loads would be more permanent if built of wood than of steel. Although wood is the oldest historically of our constructive materials, yet the question of change of strength with age has never before been studied.

Greenheart

The construction of the Panama canal lock gates of greenheart has called attention in this country to that wood, which is cut only on the northern coast of South America. The Forest Service has just issued a circular (No. 211) in which the wood is described, and figures are given to show the quantity used. The amount has been decreasing quite steadily for twenty years, due largely to the increased use of concrete in construction. The wood weighs about seventy-five pounds per cubic foot, and is sixty-five per cent stronger than English oak. The color varies from brown to black, but usually is dark green. The circular was written by C. D. Mell and W. D. Brush of the Forest Service.

Personal Appearance Counts

One of the most important things for the young salesman to learn is that courtesy is an essential factor in selling merchandise. It should constantly be borne in mind that every person who enters the store is in a sense an invited guest, and should be treated as such.

The personal appearance of a salesman has a great influence on the customer. Cleanliness, neatness, and the avoidance of extravagance and display in dress should be the rule.

The successful salesman is careful not to make promises which cannot be absolutely fulfilled. It is better to lose a sale than to make

the positive statement that goods will be delivered at a certain time, when there is no certainty that they will be. The best patronage comes from satisfied customers; broken promises do not make satisfied customers.

While successful salesmanship is based largely on big sales, it is important that every visitor to the store be treated with equal courtesy, whether a sale results or not. Polite attention, interest in one's duties, and care in waiting upon customers, are big factors in creating a favorable sentiment. It pays to please the person who is simply looking at goods, because the good impression created by courteous treatment in showing goods will often lead the visitors to become a future purchaser.

A New Thing in Boxes

The large percentage of lumber which goes into the manufacture of wooden boxes insures the success of any idea tending to preserve the life of wooden containers. A man at Wichita, Kan., is responsible for the inauguration of a new idea in knock-down boxes. This box is made up of sections accurately cut so as to fit together, and the idea involves a steel attachment which will hold the pieces together by slipping it over the corners. This should mean that boxes would have a much longer term of life inasmuch as instead of prying off nailed covers and splitting the boards to pieces, it will be necessary only to remove the attachment and the box will fall apart. Furthermore, the railways will undoubtedly grant a concession in the matter of returning the empty boxes packed together in sections, as they make such concessions on empty beer boxes and barrels.

Returns to National Casket Company

J. S. Hickok writes from the office of the Fred S. Morse Lumber Company of Springfield, Mass., that he is severing his connection with that concern and will again take up his former position with the National Casket Company as manager of the lumber department. The National company recently transferred the executive offices from New York to the Oliver building, Pittsburgh, Pa. Mr. Hickok will have his headquarters at that place and wishes it to be known to the trade that his office is always open to his friends.

Fighting Fire by Wireless

At the recent forest fire conference at Seattle, which was attended by western state delegates, members of the Forest Service, and delegates from British Columbia, one of the most interesting topics discussed related to the possibilities of replacing the telephone and telegraph systems by wireless. A representative of a wireless company explained the workings of a proposed plant, and it was believed that apparatus that would cover an area of from 25,000 to 35,000 square miles could be supplied for about \$1,600, and could be carried by mules.

Are Monkeys in Existence in Mississippi Forests?

While it is generally supposed that the monkey family is confined to tropical forests, proof of the falsity of this popular idea is found in the photograph recently sent to *HARDWOOD RECORD* by D. H. Williams of Belzoni, Miss. A cut made from this photograph is shown on this page. It may be that this is a fossilized physiognomy of a pre-historic baboon who perhaps was caught out late one night and sought refuge in the heart of the tree. Judging from the terrorized expression of his face, he spied a knot-hole in the morning and, in trying to force his way through, got stuck half-way and has gradually turned into a petrified monk. At any rate, judging from the ferocious expression of his face, it would not

BABOON FACE ON LOGWOOD BLOCK CUT BY D. H. WILLIAMS, BELZONI, MISS.

be a pleasant sensation to run across this "phys" if one were alone in the immediate vicinity along about dusk.

The baboon "cage" is a dogwood tree; thus it will be seen that there is at least a remote reason for the connection between the face and the tree.

Controlling Timber Beetles

Announcement has been made by the Secretary of Agriculture at Washington that a campaign against pine bark beetles on a tract of 90,000 acres in Oregon has resulted in showing that it is practicable to curb the activities of this destructive pest. The work was carried out for experimental purposes. The number of trees killed on the tract where the repressive measures were executed was 32,480 less than on an adjoining tract of the same size and similar conditions, where no work was done. It is well known that the pine beetle is one of the most destructive forest agencies, millions of trees being killed in some years. Progress in the direction of control of the pest will be welcomed by all lumbermen.

Analysis of Turpentines

The Forest Products Laboratory at Madison, Wis., has published Bulletin 105, showing the result of a long series of experiments in analysis and refining of turpentine. The publication was prepared by L. P. Hawley, chemist in charge. The bulletin is strictly technical in character, and doubtless will prove of much interest to persons who deal in turpentine, either as manufacturers or merchants.

Hardwood News Notes

< MISCELLANEOUS >

The Quigg Chair Company has been incorporated at Livermore, Ky., at \$10,000.

The Acme Refrigerating Company will operate at Hammond, Ind., with a capital of \$10,000.

The Glen Park Lumber Company has been incorporated at Gary, Ind., with a capital of \$60,000.

The Buckeye Churn Company of Sidney, O., has increased its capital from \$150,000 to \$250,000.

The Vaca Land & Lumber Company has been incorporated with a capital of \$15,000 at Norfolk, Va.

J. L. Hudman Lumber Company has been incorporated at Curtis, Ark., with a capital stock of \$16,000.

The Hale-Justice Company has been incorporated at Cincinnati, O., with a capital stock of \$100,000.

The Meadows Manufacturing Company of Pontiac, Ill., has increased its capital from \$30,000 to \$50,000.

The Boyne City Handle Company, Boyne City, Mich., will do business with an authorized capital of \$30,000.

The B. W. Hughes Company has been incorporated at \$50,000 to do a general lumber business at Louisville, Ky.

The Straight Creek Lumber Company has been incorporated at Pineville, Ky., with a capital stock of \$10,000.

The Kenova Sawmill Company has started business at Kenova, W. Va. This company has a capital stock of \$10,000.

The McFall-Heyser Lumber Company is the style of a new incorporation at Cincinnati, O., with \$50,000 capital.

The Covington Manufacturing Company will manufacture implements at Covington, Ala., operating with a capital of \$10,000.

The Johnson-Wilcox Hardwood Lumber Company has been organized at Los Angeles, Cal., with an authorized capital of \$50,000.

The Kuney-Parrette Lumber Company is the name of a new concern at Three Lakes, Wis. This company has a capital of \$20,000.

A new Wisconsin concern is the Conant Basket Company, which will operate at South Milwaukee, with an authorized capital of \$15,000.

The Lakewood Lumber and Construction Company has been incorporated at Whitehall, Mich., with an authorized capital of \$10,000.

The Capitol Body Company has been started at Indianapolis, Ind. This company will manufacture bodies and is capitalized at \$10,000.

The Doll & Zoeller Lumber Company has been organized at Louisville, Ky., with a capital of \$20,000 by J. Louis Doll, Jesse A. Doll and Fred E. Zoeller.

The Buckeye Safety Window Company is the name of a new concern recently incorporated at Cleveland, O. The company has a capital stock of \$30,000.

The Farmers Handy Wagon Company of Saginaw, Mich., has changed its name to the McClure Company, and increased its authorized capital to \$500,000.

Schneider & Brown, a partnership at Marquette, Mich., has been succeeded by the Schneider & Brown Lumber Company, incorporated. The capital stock is \$75,000.

The Curtis & Pope Lumber Company of Boston, Mass., has been incorporated under the same firm style by E. W. Pope, B. Pope and D. A. Lucey of Boston. The company will operate with an authorized capital of \$250,000.

The California & West Virginia Lumber & Mining Company with a three million dollar capital has been incorporated at Charleston, W. Va. Cal. Balmer, secretary of the Gillett Lumber Company, Lima, O., announces that that company is erecting a mill at Lima and will specialize in the manufacture of wagon stock and ball bats.

The East Moline Sash & Door Company of East Moline, Ill., is contemplating the erection of a new factory building, which will embody many improvements. Work will probably be started in the near future.

H. E. Townsend is building a hardwood sawmill at Texarkana, Tex., on the site of the creosote plant destroyed by fire a couple of years ago. The plant will be ready to begin operation in about two months and will give regular employment to about twenty-five men.

The Moosehead Lake Manufacturing Company will operate at Greenville, Me., dealing in and manufacturing both hardwoods and softwoods and their products. The company has a capital of \$25,000 and the officers are C. F. Woodard, president; H. W. Newenham, treasurer, both of Greenville.

The Lucas Land & Lumber Company of Paducah, Ky., which lost its plant by fire a few months ago, has closed a deal whereby it secured possession of the plant of the Mergenthaler Horton Basket Company, which has been idle for over three years. The Lucas company manufactures veneer and boxes and will employ about 125 men.

< CHICAGO >

The West Side Sash & Door Company is the style of a new concern starting at Chicago, Ill. The company has a capital stock of \$52,000.

A circular on oak flooring has just been received from the Oak Flooring Bureau of Detroit. The book contains a summary of the different grades of oak flooring, and some photographs showing important structures in which oak flooring has been used.

The Lumbermen's Club of Chicago will hold a stag party and smoker at the club rooms on Friday, February 28. The entertainment committee has prepared a program which will undoubtedly be superior to any which has yet been carried out. Those attending will be assured of a good time.

The Lumbermen's Association of Chicago holds a meeting today, Feb. 25, at 12:45 noon, at the Hotel LaSalle. This is a regular meeting of the association and luncheon will be at 1:00 o'clock. J. E. Rhodes, secretary of the National Lumber Manufacturers' Association, will address the meeting.

Robert A. Birmingham of the Dieckmann Hardwood Company of San Francisco, Cal., spent several days in this city recently and called at HARDWOOD RECORD offices on Feb. 14. Mr. Birmingham stated that the outlook on the Pacific coast is excellent.

Marshall Butters and Robert Butters of the Marshall Butters Lumber Company, Alliance, Mich., were in the city for a few days last week and during their stay favored HARDWOOD RECORD with a much appreciated call. The Marshall Butters Lumber Company is a comparatively new organization in Michigan.

J. B. Finlay, president of the Moline Pole and Shaft Company, Moline, Ill., called at the offices of HARDWOOD RECORD on Feb. 13.

Fred Mowbray of the Cincinnati firm of Mowbray & Robinson Company was in the city several days last week on business and dropped around at the HARDWOOD RECORD offices.

E. M. Holland of the Cartier-Holland Lumber Company, Ludington, Mich., was in town Thursday and Friday of last week and stopped in at these offices long enough to state that work on the company's new mill at Ludington is progressing very satisfactorily. The new Cartier-Holland plant will be a model and embody many unique features entirely original in Michigan manufacturing circles.

M. L. Pease of the Galloway-Pease Company, Poplar Bluff, Mo., and Saginaw, Mich., made one of his periodic trips to the Chicago market last week.

C. H. Sherrill of the Sherrill-King Mill and Lumber Company, Paducah, Ky., was in the city on business the early part of last week.

J. T. McRoberts, manager of the Wabash Hardwood Company, Memphis, Tenn., spent several days last week with the Chicago trade. Mr. McRoberts reports that sales are easily effected, but that there is some difficulty in getting adequate stock.

I. A. Enshong of the Northwestern Cooperage and Lumber Company of Gladstone, Mich., spent several days of last week with the local trade.

Frank T. Sullivan, manager of the Buffalo yard of Hamilton H. Salmon & Co. of New York, stopped off in Chicago last week on his return from a trip to the Northwest. Mr. Sullivan found time to call at HARDWOOD RECORD offices.

W. D. Reeves of the W. D. Reeves Lumber Company of Little Rock, Ark., has been in the city for several days on business.

M. J. Quinlan of the Menominee Bay Shore Lumber Company of Soperton, Wis., spent a few days the early part of last week with the local trade.

Frank I. Abbott of the Frank I. Abbott Lumber Company, Chicago, returned on Friday of last week from an extended trip to Memphis, Arkansas and other points.

R. S. Kellogg, secretary of the Northern Hardwood and Hemlock Manufacturers' Association, Wausau, Wis., was in Chicago three days last week in attendance at the meeting of the National Association of Box

Manufacturers at the Hotel LaSalle. Mr. Kellogg, who is optimistic in his views of the lumber situation, stated that there is no possibility of a break in prices for a long time to come.

◀ NEW YORK ▶

Local lumber dealers are interested in the Murtagh-Jackson workmen's compensation bill now before the legislature. The bill is being opposed by nearly all manufacturers and other employers of labor, and the lumber trade of the state was represented at a hearing on the bill at Albany Feb. 19. It is expected that the measure will be modified before final action is taken on it.

On Feb. 6 G. A. Mitchell, head of White, Gratwick & Mitchell, gave a theater party and dinner at the Hotel Vanderbilt to the officers and department heads of the various affiliated wholesale selling companies. There were about thirty present. This is an annual event, but this year broke all records for a good time.

The New York Lumber Trade Association held its regular meeting on Feb. 19 at its headquarters, 18 Broadway. Three new members were elected and other routine business transacted at a meeting of the board of trustees held immediately after the regular meeting.

B. P. Whedon of W. D. Young & Co., manufacturers of maple flooring, Bay City, Mich., was a New York visitor last week. Mr. Whedon was on his usual business trip and had traveled the middle and southwest territory and New England States. He looks forward to a strong market and a higher range of prices.

The East River Mill & Lumber Company held a directors' meeting last week at which time D. J. O'Connell was elected president, to succeed the late Thomas J. Crombie, and C. D. Folsom was elected secretary and treasurer to fill the vacancy caused by Mr. O'Connell's promotion. These men and P. C. Anderson compose the directorate of the corporation.

The Maley, Thompson & Moffett Company, specialists in Cuban mahogany and walnut, headquarters at Cincinnati, O., and branch office at 65 Beaver street, Manhattan, has just received at this port a cargo of fine mahogany logs from Cuba. The shipment comes from Moffett, Robbins & Company, Cuban branch of the Cincinnati house.

The Consolidated Lumber Company of Georgia, with headquarters at Brunswick, Ga., has closed its New York City sales office and hereafter will handle all business direct from the main office. This will facilitate shipments and is in line with the company's plan to make its service as complete as possible. It is making a special drive on rail business into the Middle Atlantic States.

C. S. Powell, formerly of Bay Side, Long Island, has opened an office in the Wilson building, 1270 Broadway, where he will conduct an export and domestic hardwood business.

G. F. Farrell, formerly president of the O'Neill Lumber Company of Jersey City, has disposed of his interest in that concern to S. Henry Baldwin and brothers. The officers of the company are now: P. A. Baldwin, president; G. B. Baldwin, vice-president, and S. Henry Baldwin, secretary and treasurer.

The stockholders and directors of the Lumber Insurance Company of New York met in annual session on Feb. 5. The following officers were elected: G. A. Mitchell, president; W. H. Gratwick, vice-president; Guy White, treasurer, and R. H. McKelvey, secretary. Geo. M. Stevens, Jr., was elected to the board of directors. The financial statement as of Dec. 31, 1912, was most gratifying, showing a big increase in surplus to policy-holders and total assets.

◀ BUFFALO ▶

The ruling of the Interstate Commerce Commission on the transit privilege pleases the Buffalo lumbermen, especially the hardwood dealers whom it most concerns. It means the doing away of the rule forbidding substitution at transit points, as for instance oak for maple and vice versa. For some time the hardwood men have been handicapped by the regulations in force by the railroads, and the local market will now be on a much better basis than it has been. The commission went into the matter thoroughly and held two or three hearings at which Buffalo hardwood dealers were present.

Willis K. Jackson of Jackson & Tindle, with members of his family and others, sailed on Feb. 22 for a trip to Panama and the West Indies.

O. E. Yeager was among the business men from this city who appeared before the legislature on Feb. 19 in opposition to the Murtagh-Jackson workmen's compensation bill. Nearly every business and trade association was represented.

A. W. Kreinheder made a trip to the Tennessee mills of the Standard Hardwood Lumber Company this month. He states that operations in that part of the South have been much delayed by wet weather.

T. Sullivan & Co. have lately been getting in stocks of maple to replenish the supply in yard. Reports from the office state that one-inch Nos. 2 and 3 basswood in this market has been well cleaned up.

H. A. Stewart, who was recently in West Virginia, states that buyers are very numerous at the mills there and that supplies of chestnut and poplar are being picked up rapidly at stiff prices.

G. Elias has returned from an eastern business trip. The firm of G. Elias & Bro. has found the hardwood trade very good this month, with a demand for all sorts of stock.

B. E. Darling of Blakeslee, Perrin & Darling, Inc., was lately in the

South looking after the purchase of hardwoods. The firm has a large amount bought in most varieties and is laying in quite an amount of cypress.

Lugh McLean was at the mills of his lumber company in the South for a week this month. Angus McLean of Montreal has been spending some days at the company's offices here.

The National Lumber Company reports that trade has been exceptionally good this month. James A. White, president of the company, lately took an office in the White building, where he will look after the interests of the W. H. White Company.

M. M. Wall has returned from a two weeks' trip to Mt. Clemens, where he went with his friend Peter McNeil of the McNeil Lumber Company. The Buffalo Hardwood Lumber Company has been selling quite an amount of birch this month.

W. P. Miller of Miller, Sturm & Miller has been in Ohio and other western states this month, looking over lumber stocks and closing a deal with two or three mills for shipment of hardwoods.

Anthony Miller finds trade showing considerable improvement since the first of the year. He has a well-selected stock and finds a good sale for oak, birch and other woods.

◀ PHILADELPHIA ▶

The Thomas E. Coale Lumber Company reports increased trading, with promising outlook. It recently divided its Pittsburg branch of business into two subsidiary companies which will facilitate the handling of the trade. One company will be known as the S. B. Dill Company, recently incorporated with a nominal capital of \$5,000, and with headquarters in the same suite of offices as parent concern. It will specialize in railroad ties and timber. The officers are: President, S. B. Dill, formerly with the Thomas E. Coale Lumber Company; secretary, Frederick H. Ely, also of the old house; treasurer, R. H. Moore.

The second company will be known as the E. W. Cross Lumber Company, recently incorporated, \$5,000 capital, offices in the Oliver building, Pittsburg. The president, B. W. Cross, formerly in charge of the Pittsburg branch of the old concern, having had about twenty years' experience in the lumber business, needs no introduction to the trade. Frederick H. Ely is secretary; R. H. Moore, treasurer, associated with the Thomas E. Coale Lumber Company, and is also treasurer of the S. P. Bowers Company of Philadelphia. It will do a general wholesale lumber business.

John H. Schofield of Schofield Brothers, owners of the Saltkeathie Lumber Company, says there has been no interruption to trading since Jan. 1, and their fiscal year, ending March 31, will show the biggest year's business they have ever had. Robert W. Schofield is at the mill in Schofield, S. C., hurrying up shipments.

Charles G. Blake, manager of E. V. Babcock & Co., reports accelerated business, with every indication of further increase as the season advances.

Ben C. Currie of Currie & Campbell, says business is fairly good and inquiries more liberal, which promises well for the outlook. James H. Campbell and William N. Lawton of this house are at their mill in Jacksonville, N. C., hustling out stuff.

Howard B. France, secretary and treasurer of the Monarch Lumber Company and of the Haddock-France Lumber Company, reports business well sustained and the outlook very favorable, providing prices are not forced to a prohibitive point. The large corporate consumers stand ready to shut down on buying as soon as any attempt is made to force values.

The large warehouse and lumber sheds of B. F. Hiestand & Sons, Marietta, Pa., were destroyed by fire, Feb. 8. The loss is estimated near \$250,000.

◀ PITTSBURGH ▶

J. N. Woollett, president of the Aberdeen Lumber Company, spent a good part of this month in the Southwest buying gum and cottonwood. He unloaded one barge of cottonwood at Louisville last week and has three more barges coming up the river for early distribution.

H. C. Messler, of the J. M. Hastings Lumber Company, spent two weeks recently in the South. He reports the export trade in fine condition there.

The W. P. Craig Lumber Company announces that the prices are still strong and business is first-class. It is still handicapped by the lack of cars at some mills.

The Adelman Lumber Company is getting into a very nice business in general hardwoods. A. Adelman has been working the Ohio trade the past week.

A. G. Breitwieser of C. E. Breitwieser & Co., a new hardwood concern, was also working Buckeye retailers early in the month. His concern is arranging to do considerable business in cypress this year.

The Foster Lumber Company has eight mills of its own cutting hardwood on tracts in Tri-State territory. It shipped forty cars of white oak last week, most of it being bill stuff.

D. L. Gillespie of D. L. Gillespie & Co. was in the Middle West on business a few days last week. H. G. Clark of the same company has gone to Mississippi for a few days.

The Mell-Viall Lumber Company is a new concern at Kittanning, Pa., formed by Howard W. Mell and O. H. Viall and others of that place.

The E. W. Cross Lumber Company is getting under fine headway for

a new concern, and B. W. says that business looks good all around the Pittsburgh district.

The E. H. Shreiner Lumber Company is getting ready to sell a lot of chestnut and poplar for it has contracted for some fine stocks of these woods this year. Mr. Shreiner lately made a trip among the southern mills.

H. T. Bettinger, of the Nicola Lumber Company, has been on a buying expedition in the South for several weeks. The Nicola company is getting a fine business this spring and says everything looks good.

◀ BOSTON ▶

Leonard J. Jackson, who for thirteen years has been connected with the W. A. Fuller Lumber Company, Leominster, Mass., is now connected with the Lyon Cypress Company, at Caryville, Ga.

The Emery Lumber Company, Portland, Me., has been incorporated with a capital stock of \$10,000. The promoters are C. N. Haskell, Leslie L. Mason and Irving E. Vernon.

The Bangor Lumber Company, Bangor, Me., has been incorporated with a capital stock of \$50,000. The incorporators are: Henry Patton, James Q. Gulnac, Albany, N. Y.; Don A. Sargent, Bridgeport, Conn.; D. Allston Sargent, South Brewer, Me.; Fred C. Patton, Albany, N. Y.

The Keswick Lumber Company, Bangor, Me., has been incorporated with a capital stock of \$25,000. The incorporators are: M. G. Lowell, Waldo P. Lowell, Bangor, and John R. McVonnell, Marysville, N. B.

There has been more doing in the building line in Boston during the past winter than for several years. Other cities have experienced a similar increase. Several office buildings have been completed, which have called for a large amount of interior finish, and the mills in this section have been kept very busy.

Peck & Marcoullier, lumber dealers and woodworkers, Westfield, Mass., have dissolved and the business will be conducted by George F. and Arthur D. Marcoullier, under the name of Marcoullier Brothers. Abner E. Peck and his son, Luman O. Peck, retired from the firm, but will continue in the lumber business.

The Thames River Lumber Company of New London, Conn., at its annual meeting voted to increase its capital stock by \$25,000, making a total stock of \$100,000.

The E. C. Wright Block Company, Brockton, Mass., is building a large factory in that city, for the purpose of manufacturing last blocks. This will make a demand for large quantities of hardwood lumber, especially maple.

Sarah A. Leatherbee, widow of John W. Leatherbee, one of the pioneers of the lumber industry in Boston, died at her home in Jamaica Plain, late in January, at the age of eighty-eight years.

◀ BALTIMORE ▶

President Fred Arn, the new executive of the National Lumber Exporters' Association, acting on an invitation of the National Wholesale Lumber Dealers' Association, has appointed Harvey M. Dickson of the Dickson Lumber Company of Norfolk; John L. Alcock of John L. Alcock & Co., Baltimore, and Walter Hart of Price & Hart, New York, official representatives at the annual meeting of the wholesalers, which will be held at Atlantic City March 6 and 7.

William Otis Price, for years engaged in the hardwood export trade here, with offices in the Continental building, Baltimore and Calvert streets, died on Feb. 12 at his home, 1906 Walbrook avenue, after an illness of about two years. For a year he had been at his office only at rare intervals, and for several months he was confined to bed. Mr. Price was born forty-five years ago in Frederick county, Maryland, and first became identified with the hardwood trade as an inspector for Price & Heald. Later he formed a partnership with his brother under the name of E. E. Price & Bro., which partnership was dissolved after some years, when W. O. Price engaged in business on his own account. He was very successful as long as his health remained good. He held membership in the National Lumber Exporters' Association and was identified with other movements to promote the best interests of the trade.

Robert McLean, a well-known hardwood exporter and official of the Battery Park Lumber Corporation, with a mill at Battery Park, Va., returned Feb. 17 from a several months' trip abroad. Mr. McLean reports that the hardwood situation on the other side is decidedly encouraging, and his views fully bear out the optimistic accounts sent out in recent months about the export business. Mr. McLean found that the demand for all kinds of stocks was good, even brisk, and that prices were being well sustained. He is a large shipper of gum, which wood, he states, is holding its own and runs very firm.

H. L. Bowman, sales manager of the R. E. Wood Lumber Company, Continental building, has gone to Rift, W. Va., to look after the operation of the company's mill there and to confer with the superintendent in regard to the special requirements of the company. From there it was his intention to proceed to Fontana, N. C., where the company is about to put in operation its new mill, erected to take the place of the plant operated for some years. G. L. Wood, the general manager of the company, is also at Fontana, giving the work of construction his personal attention.

David T. Carter & Co., hardwood men, have moved from the tenth to the ninth floor of the Calvert building, the expansion of their business requiring more office room.

E. F. Burke, president of the Battery Park Lumber Corporation, has moved his office from the Stewart building to the Munsey building, Calvert and Fayette.

◀ COLUMBUS ▶

Upon the application of the Jobson Lumber Company, 528 City avenue, John T. Dunnick was appointed receiver of that company. Mr. Jobson claims to be surety on notes amounting to more than \$15,000, of which \$3,000 are due now. Receiver Dunnick gave bond in the sum of \$10,000.

D. R. Winn of the A. C. Davis Lumber Company has returned from a buying trip in the cypress district of the South.

The McFall-Heyser Lumber Company of Cincinnati, Ohio, has been incorporated with a capital stock of \$50,000 to deal in lumber and operate mills. The incorporators are: W. E. Heyser, Weaver Haas, Charles J. Hunt, D. A. Rebbaeh and Norwood J. Utter.

Representatives of Ohio lumbermen and builders in conference with Governor Cox, requested that the optional feature be incorporated in the Green compulsory workmen's compensation bill, which is in the hands of the Senate labor committee. Most of the members of the delegation favored the compulsory provision in the measure but objected to the clause which makes the state the exclusive liability insurance agent.

With a mechanics' lien law to be enacted and appropriations for an extensive program of state building, local architects and contractors anticipate a revival of building operations as soon as these questions are settled by the general assembly. There is a lull just now in building plans and operations, owing to the uncertainty of the mechanic lien proposal. While a bill approved by representatives of the various interests involved has been drafted, it is feared that changes may be made altering the purpose of the law by the legislature.

J. A. Ford of the Imperial Lumber Company says trade in hardwoods has been good, prices firm and stocks growing a little scarcer, which has caused an advance in prices.

W. W. Hammerick, a wholesaler of Detroit, Mich., was a visitor in Columbus recently.

John Henderson, secretary of the Hope Lumber Company of Weston, W. Va., called upon Columbus shippers recently.

F. Everson Powell of the Powell Lumber Company reports a fair business in hardwoods, with the volume as good as can be expected under the circumstances. Stocks are only fair and there is not a great deal of trouble in receiving shipments.

W. B. Sissons, sales manager for the Sowers-Leach Lumber Company, says trade is about the same with prices high. Mr. Sissons looks for a good demand for hardwoods when the spring building season opens.

L. B. Schneider, sales manager for John R. Gobey & Co., says hardwoods are strong and inclined to advance. Stocks are very scarce and shipments are a little slow in coming out.

R. W. Horton, sales manager for the central division of the W. M. Ritter Lumber Company, says the demand is good for all grades and varieties of hardwoods. Both quartered and plain oak are especially strong and advances have been announced in the past two weeks. There is also a good demand for poplar, especially the lower grades.

F. B. Pryor of the W. M. Ritter Lumber Company has returned from a business trip in Michigan.

◀ TOLEDO ▶

The Skinner Bending Company reports a good business, the demand being much better than it was a year ago at this time. This concern has plenty of material on hand as it carries an unusually heavy stock at all times.

The Gotshall Manufacturing Company reports the general demand good and prices strong. This concern is greatly handicapped on account of the fire suffered last fall. The plant will be rebuilt as soon as the weather permits.

The Toledo Turning Works is running at two-thirds capacity and the management is looking for a heavy spring call.

The Toledo Bending Company is operating at two-thirds capacity and reports the demand for its product fair, although the management predicts that the strike difficulties in this country and the war in Mexico will affect the demand considerably. This concern does considerable exporting.

The Piqua Furniture Company of Piqua, O., manufacturer of library tables, by the voluntary act of all the stockholders, recently went into the hands of a receiver. S. Mendelsohn was named by the court as receiver. The factory will be operated by the receiver. The company was capitalized at \$55,000.

The Bryan, O., factory of the Bryan Showcase Company, which was recently destroyed by fire, has concluded not to rebuild in Bryan and is looking for a new location. It is intimated that Findlay, O., may be chosen. This concern is one of the leading manufacturers of display cases in the country.

◀ INDIANAPOLIS ▶

Fred C. Gardner of E. C. Atkins & Co. has been elected president of the Columbia Club.

The Furnas Office & Bank Fixture Company has increased its capitalization \$12,000.

M. W. Mix, of the Dodge Manufacturing Company, Mishawaka, has been re-elected president of the Manufacturers' Bureau of Indiana.

H. C. Wiese has been appointed receiver for the Roach-Brown Manufacturing Company, manufacturer of tables and kitchen cabinets, on application of the W. M. Ritter Lumber Company, a creditor. Assets are \$11,000 and liabilities about \$12,500.

With an increase in capitalization, the Hoosier Veneer Company has been reorganized and incorporated with an authorized capital stock of \$100,000. The principal stockholders in the reorganized company are William T. Connor, Harry E. Dougherty, Frank Manners, Joseph Gross and Robert L. Connor.

The Hagerstown Lumber & Manufacturing Company has been granted a charter by the state and will conduct a manufacturing and retail lumber and planing mill business at Hagerstown. The authorized capitalization is \$15,000. Those interested in the company are Daniel B. Clark, Henry M. Keagy, Oscar Werking, Daniel O. Dilling, Horace Hoover, John M. Werking, William Stout, Eli Wiseheart, John C. Clark, Charles L. Stetelmeyer and A. R. Jones.

MEMPHIS

All danger from flood at Memphis has passed and even the plants which were closed down on account of high water have been able to resume operations. There were only a few of these and they were located on Wolf river. The interruption to manufacturing operations was extremely limited this season and lumbermen are congratulating themselves on the fact that the third highest stage in the history of the Mississippi river at Memphis has come and gone with so little injury and inconvenience.

South of Memphis conditions are not quite so favorable. There is still a large area overflowed near Beulah, Miss., and a number of manufacturers of hardwood lumber are finding themselves in a rather unenviable position. They have both timber and lumber under water, and in some cases the plants are out of commission and probably damaged to some extent. No breaks have occurred except at Beulah and advices from both sides of the river indicate that the levees will probably hold intact.

There has been a decided change for the better in weather conditions during the past week. Very little rain has fallen and the ground is drying out. So much rain has fallen since the first of the year that logging work has been very much interfered with. Operators of sawmills and owners of timberlands are glad of the change for the better in weather conditions because it will be possible to get out timber on a more liberal scale. Work in the woods since the first of the year has been quite limited and the timber outlook is not very encouraging at the moment.

The Valley Log Loading Company loaded for Memphis during January slightly less than 1,200 cars of logs on the Yazoo & Mississippi Valley line. This company says that it is having considerable difficulty in securing all the equipment necessary for the handling of log shipments. It says that it ought to be loading about 1,600 to 1,700 cars of logs per month, with the result that it is operating at less than seventy-five per cent of its capacity. An unusually large supply of timber was gotten out on the right of way of the Yazoo & Mississippi Valley line last fall and winter and this is now being loaded as fast as equipment can be secured for that purpose.

Russe & Burgess, Inc., have recently bought a considerable quantity of additional timberlands in Tunica county, Miss. This firm has owned a great deal of timber in the Mississippi valley for a number of years, and has found purchases there quite profitable. The exact amount purchased in the last instance is not known, but it is understood to have been considerable.

Arrangements have been completed for the trip to Panama and points in Central America to be made by prominent Memphians under the auspices of the Business Men's Club. A special train will be run from Memphis to New Orleans. Among the prominent lumbermen who will go on this trip are the following, all of whom are to be accompanied by their wives: Mark H. Brown, S. B. Anderson, Frank May and W. A. Ransom. There have been so many applications for additional accommodations that efforts have been made during the past few days to secure a second boat from New Orleans. Negotiations to this end, however, have been unsuccessful and those late in making their reservations will find it impossible to go.

Gatlett & Foley, Olney, Ill., have announced plans for the erection of a large sawmill and slack barrel stave plant at Harrisburg, Ark., for the development of timber on a large tract of land purchased in Poinsett county a short time ago. The company will not only locate its plant at Harrisburg, but will also build a standard gauge railroad from that point to its timberland holdings some miles distant. It is said that work on the plant will begin within the next sixty days.

The Arcola Hardwood Company has received its charter. The company is capitalized at \$10,000 and will engage in the hardwood lumber business at this point. The principal incorporators are: C. D. Hendrickson, Sam George, George Keith, W. R. Sent and W. H. Harrelson. Mr. Hendrickson has been prominently identified with the hardwood lumber industry of Memphis for a number of years.

J. W. Dickson, president of the Valley Log Loading Company, is confined to his home with a broken ankle, the result of his foot turning with

him in getting out of a taxicab the night of the masked ball at the Chickasaw Club.

The ordinance covering the arrangement between the city of Memphis and the Rock Island System has passed final reading and it is announced that work will shortly begin on the immense terminals to be erected by that system. It is provided in the ordinance that work on these terminal facilities must begin within thirty days after the passage thereof. It is provided by the congressional enactment that work on the bridge itself must begin by the latter part of July. The bridge and terminals are to be constructed by the Memphis & Arkansas Railway, Bridge & Terminal Company.

Advices received here from Jackson, Miss., indicate that practically all the lumber manufacturing plants in that state are operating on full time and that they have been interfered with to only a limited extent by the high water in the Mississippi. These dispatches also indicate that the car shortage is only a matter of memory, though it is pointed out that some localities are having difficulty in securing all the equipment necessary.

The Dugger & Goshorn Company has filed application for an amendment to its charter through which it seeks to increase the capital stock from \$30,000 to \$100,000. The document is signed by the principal incorporators. The company has recently established a band mill at Varner, Ark., and has purchased additional timberlands in that section. It has likewise increased the capacity of its plant at Memphis and otherwise enlarged the scope of its operations.

The Tennessee Hloop Company will have its plant for the manufacture of hoops, heading and staves in readiness for operation within the next few weeks. This firm recently increased its capital stock to \$100,000 in order that it might establish a plant for the manufacture of heading and staves, as well as elm coil hoops. Members of the Anderson-Tully Company are among the principal stockholders in the Tennessee Hloop Company.

BRISTOL

The Peter-McCain Lumber Company reports business in good condition. The company's mills here are now running full time.

There were numerous eastern buyers on the Bristol market this week. They report a scarcity of stocks in this section, although shipments for the past few weeks have been heavy.

W. S. Whiting, a well-known lumberman of Asheville, N. C., was a visitor this week on the Bristol market.

John T. Dixon of the John T. Dixon Lumber Company of Elizabethton, Tenn., was in Bristol this week on business.

The Carolina Spruce Company is installing a large mill on the Black Mountain Railway, in western North Carolina, which will soon be ready for operation.

The Paxton Lumber Company reports business in good condition. The company's mills are busy and it is doing a large volume of business.

Bristol lumbermen are now enjoying the fruits of their recent victory over the railroads, before the Interstate Commerce Commission. The milling-in-transit charge at Bristol has been reduced from one and one-half cents to two cents per hundred pounds.

D. D. Hartlove of Price & Heald, Baltimore, was among the eastern hardwood buyers on the Bristol market this week. He has bought heavily in this territory and is now shipping out a large amount of stock.

Numerous country mills about Bristol, which have been idle during the winter, are preparing to resume operation as early in the spring as possible.

LOUISVILLE

The visit of the members of the Louisville Hardwood Club to Nashville as the guests of the Nashville Lumbermen's Club on Feb. 18 was one of the most enjoyable visits of the kind ever planned. It went through without a hitch, and the Louisville men left for home at midnight after one of the most strenuous days in the way of enjoying hospitality that they had ever experienced. The visit will probably prove to be the first of several of this kind, not only between the Louisville and Nashville clubs, but for all of the hardwood associations of this district. This was the key struck at the smoker which was the final feature of entertainment devised by the Nashville lumbermen, and it was declared that the visit of the Louisville men marks a new era in club work in the hardwood producing district. The Louisville crowd was about sixteen strong, and made the trip in a special Pullman sleeper attached to the regular Louisville & Nashville trains. The lumbermen were met at the depot by the Nashville men, who took the visitors automobile before breakfast. This was served at the Hermitage hotel. Following the meal a trip was made in autos to the lumber mills and flooring factories of the western end of the city. Lunch was enjoyed at the Commercial Club. The afternoon was given over to the business in other parts of Nashville, the lumbermen returning to the central part of the city in time for an elaborate dinner at the Commercial Club. Following this the visitors were given a box party at the Princess theater, and upon its conclusion were further entertained at a smoker at the Commercial Club, when oratory and story-telling were given an opportunity to become evident for the first time. The Louisville lumbermen were then taken to the depot in autos, and rolled into their berths at

midnight with the sense of having been "shown" that Nashville has a brand of hospitality no whit inferior to that of Louisville. The Nashville Club will shortly be asked to sojourn in Louisville. Edward L. Davis, president of the Louisville Club, and Hamilton Love, head of the Nashville Lumbermen's Club, vied with each other in tossing verbal bouquets in the direction of their respective organizations.

The Louisville Board of Trade has filed a formal complaint with the Interstate Commerce Commission, asking that the Louisville & Nashville be compelled to exchange switching facilities with other roads. Lumbermen, who are daily affected by the regulations of the Louisville & Nashville shutting out other lines on competitive business, are keenly interested in the progress of the complaint.

Harry E. Kline of the Louisville Veneer Mills, is chairman of the Point Improvement Association, composed of lumbermen and others who are seeking the construction of a dike around the northeastern portion of Louisville for the purpose of protecting the industries located there against the overflow of the Ohio river. The government has agreed to survey the Point and take the project under consideration. It is probable that the work will be done by joint expenditures on the part of the municipal and federal governments.

Continued advances in ash and plain oak have featured the local situation of late. The general belief among lumbermen, however, is that prices have about reached their limit, and that it will not be good policy to attempt to shove them much higher. Large consumers have arranged their year's work on the basis of prices current earlier in the season, and it would be hard on them and would probably affect consumption if quotations were increased to a great extent. The local lumbermen, as a rule, are willing to go ahead on the present basis and turn over as much lumber as possible.

J. E. Davis, vice-president of the Edward L. Davis Lumber Company, is now associated with that company actively, after having been at Hope, Ark., for several months. Mr. Davis was working on a timber tract there with the Ransom interests of Nashville, and was intending to operate a sawmill for the manufacture of the lumber. The plan now arranged, however, is to have the lumber cut by contract. Consequently Mr. Davis will not be compelled to maintain his residence at Hope, but will be able to devote his time to the Louisville situation.

The new resaw of the Norman Lumber Company at its Holly Ridge, La., mill has been started in operation. The company now expects to average 1,000,000 feet of lumber a month.

The Swann-Dav Lumber Company has announced plans for the erection of a large mill near McRoberts, in the recently opened up eastern Kentucky district. The company is said to have secured one of the finest bodies of timberland in that part of the state. It is principally poplar.

The C. C. Mengel & Bro. Company, mahogany manufacturer of Louisville, has increased its capitalization from \$1,700,000 to \$3,500,000, a total increase of \$1,800,000. The company's business has been growing rapidly, and the additional capital will be used to enable it to take care of expansions as they develop. No definite plans for improvements have been made, however.

◀ MILWAUKEE ▶

Louis Leidiger was elected president of the Merrill Veneer Company at the annual meeting of the directors this month. Napoleon Desrosier is vice-president, and W. A. Runge is secretary-treasurer.

The Badger Basket & Veneer Company of Burlington has been reorganized and the capital increased to enable the extension of the business along several lines. H. Wegwart, president, will become sales-manager. Ralph W. Story, secretary-treasurer, who recently purchased a one-third interest in the concern, has taken over the business management. An extension will probably be made to the factory this summer.

Another chair factory is to be erected in Sheboygan. The Sheboygan Couch Company has been incorporated for \$50,000 and contemplates erecting a large factory in that city for the manufacture of furniture.

Articles of incorporation have been filed by the Kuney-Parrette Lumber Company of Three Lakes. The concern has been incorporated by Charles T. Kuney, J. P. Parrette and R. L. Parrette with a capital stock of \$20,000.

Several carloads of machinery are being received by the owners of the new Peshtigo sawmill and it is being installed as rapidly as it is received. The structure is being rapidly completed, the open winter having permitted more work than usual.

The F. Eggers Veneer Company of Two Rivers, one of the world's largest veneer goods manufacturers, has acquired the plant of the defunct Plymouth Veneer Company of Plymouth. The two plants will be combined at Two Rivers.

The investigation in wood distillation, which has been carried on during the last three years at the United States Forest Products' Laboratory at the University of Wisconsin at Madison, is to be further developed by supplementary work at the University of Washington. Dr. L. F. Hawley of the Wisconsin laboratory has just returned from the Northwest where he co-operated with the Washington men in getting the investigations under way. The United States Forest Service has set aside \$10,000 for the work in the western state. Scientific data concerning the utilization of mill waste, of logging waste and of stunted forest growth is being obtained. The work will also be continued at Wisconsin.

Kraetzer-cure LUMBER

☞ Kraetzer-Cured lumber is susceptible of being thoroughly kiln dried or air dried in less than one-third the time ordinarily required for seasoning unsteamed wood.

☞ Kraetzer-Cured lumber does not case-harden, check, end-split or stain, and dries without warping or buckling.

☞ Kraetzer-Cured lumber has a uniform tone of color. Its working qualities are greatly improved, and the beauty of the flake on quarter-sawed stock is enhanced.

☞ Kraetzer-Cured lumber dries out to materially less weight than unsteamed wood, ranging from 200 to 500 pounds per thousand feet.

☞ Kraetzer-Cured lumber will neither shrink nor swell, and the grain will not raise when water stains are employed in finishing.

☞ Kraetzer-Cured lumber is not impaired in strength or quality by the process.

☞ Kraetzer-Cured lumber is produced by the use of the Kraetzer Preparator, a steel cylinder permanently closed at one end and fitted at the other end with a quick-opening and closing steam-tight door, manufactured by

The Kraetzer Company 537 South Dearborn Street CHICAGO, ILL.

Kraetzer-Cured lumber is produced by the following well-known manufacturers:

- John Schroeder Lumber Company....Milwaukee, Wis.
Maple, Birch and Oak Flooring
- Russe & Burgess, Inc.....Memphis, Tenn.
Red and Sap Gum, White and Red Oak
- Bennett Hardwood Lumber Company, Memphis, Tenn.
White and Red Oak, Red and Sap Gum, Sycamore and Cypress
- Lamb-Fish Lumber Company.....Charleston, Miss.
Red and Sap Gum, White and Red Oak, Cypress
- Santee River Cypress Lumber Co.....Ferguson, S. C.
White and Red Oak, Red and Sap Gum, White Ash
- Forman-Earle Company.....Heidelberg, Ky.
Poplar, White Oak and White Oak Flooring
- C. L. Willey.....Chicago, Ill.
Mahogany and all figured Foreign and Domestic Woods
- New England Hardwood Co.....Mountain Mills, Vt.
Birch, Beech and Maple
- Saline River Hardwood Company.....Pine Bluff, Ark.
White and Red Oak, Red and Sap Gum

Kraetzer-cure LUMBER

The Hardwood Market

< CHICAGO >

Chicago trade is at present divided into two classes—those who have lumber to deliver and those who have not. It is not a question locally of selling stock, but entirely of buying. Stock sells and at good prices and, judging from the sentiment of most of the members and their expressed opinions of the situation, this status of affairs will continue for some little time. Most standard woods in both northern and southern stock are not only in active demand, but commanding a very satisfactory level of prices. Oak, of course, is predominant in demand, but, in keeping with the conditions in a great many other points, ash is another extremely active factor. Maple, birch, beech and other northern woods are moving actively.

The factory trade is good in Chicago. The mild weather of a couple of weeks ago started a number of building operations which have been checked for a short time by the cold weather immediately following. There is every reason to believe, however, that building business will be unusually active during the spring and summer months.

< NEW YORK >

Strong conditions still prevail in the local hardwood market, and there is no immediate prospect of slackening. Good lumber is hard to obtain and there is a large demand for all that finds its way into the market. The continued improvement in the matter of poorer grades is taken as an indication that the demand for lumber is healthy and will continue so. Such woods as have been leaders in this market are still in good call at high prices, with oak and ash leading the way. Buyers who stayed out of the market at the first signs of higher prices now realize that the advances have been genuine with the result that local stocks are low and the demand for actual needs is great enough to absorb all that comes in. Buyers returning from manufacturing points report low stocks, difficulties attending manufacture and high cost of stumpage, features which mean anything but a falling off in values.

< BUFFALO >

Hardwood dealers state that trade has been very satisfactory so far this month and most of them are selling quite a fair amount of lumber. Logging conditions in some localities have not been as favorable as they usually are in winter time, and this has had much to do with keeping up the price of stock. There is firmness almost everywhere in the list, with the prospect of this feature continuing. Some dealers feel that prices are not likely to work much higher than at present, but say that if they do it may lead to some curtailment of orders by manufacturers.

The chief wood in demand continues to be plain oak, with quartered showing more firmness than it did some weeks ago. Maple and birch are also holding up well. Brown ash is in better demand and is being used a good deal for crating purposes. Beech shows improvement and basswood has picked up somewhat. Poplar in most grades is also in better demand, and mills have but small stocks at present to offer.

< PHILADELPHIA >

A gradual strengthening of the hardwood market is noticeable during the last fortnight. Among the wholesale consuming industries buying continues active, and the large corporations especially are buying freely for ties and railroad timber. Boxmasters are working on increased orders, and the general outlook is promising for steady trading throughout the year, the paucity of material being the only difficulty. For the wholesaler without strong mill connections, the situation at the mill ends is not very encouraging, and the query "Can you deliver the goods?" is unflinchingly made by the purchasing agent at this time. There is fear that the manufacturers may force values to a height that would act as a boomerang, apropos of which danger, many of the readers of HARDWOOD RECORD, have made the remark that the cartoon in the issue of Feb. 10 hits this particular nail squarely on the head. The respective positions of the hardwoods remain as previously reported. Plain oak continues the topper, with quartered oak forging rapidly to the front; ash holds firm; gum is strengthening; maple in good demand; birch makes new friends; mahogany and veneer market is active; beech, poplar and basswood are also in good call.

< PITTSBURGH >

Things are moving along at a very steady pace in lumber buying although the volume of business has not been quite so large on recent orders as wholesalers anticipated. Yardmen have been a little bit slow in coming forward with their orders, as many of them think that lower prices can be secured later on. They are going to be badly mistaken in this idea. All quotations are held very firm on hardwoods, and stocks are scarce. Mills are not gaining any in supply. The impassable roads and the floods, together with car shortage, have made it uniformly difficult to get anything like a full quota of hardwood shipments this winter. Southern hardwoods are very firm in demand and export trade is reported good. The furniture and implement people are taking a large amount of stuff this winter and look for good business all the year.

< BALTIMORE >

None of the recent developments in the hardwood market have been such as to cause manufacturers and dealers to take a less favorable view of the situation or to cloud the outlook. The demand keeps up surprisingly well in practically all divisions of the business, with a wide range of prices. It cannot be said that any easing off has occurred. Consumers are evidently obliged to provide for large requirements and the hunt for lumber goes on so actively that the mills have been unable to accumulate considerable stocks. The tone of the market is rendered all the firmer, perhaps, by the fact that the almost bottomless state of the roads makes it very difficult to haul logs or to get lumber to railroad stations. This renders sawmill operations and the distribution of the output very difficult and tends appreciably to keep the range of prices firm. Oak is not only holding its own, but appears to show additional strength, the quotations at present being almost the highest ever realized in the trade.

The export movement is also brisk, notwithstanding the rather liberal

forwardings that have been made in recent months. On the one hand, there are foreign brokers who warn against the danger of over-shipments and a declining market, and on the other the caution is expressed that with the quotations going higher the foreign buyers will be encouraged to employ substitutes. It is probable that the foreign movement has not assumed such proportions as to affect prices unfavorably, although part of this result must also be attributed to the increased requirements of the buyers abroad.

Poplar is holding its own, with extra wide lumber just a shade stronger than it has been, but with prices by no means satisfactory. The prevailing tendency is to use wide stocks more freely than has been the case, but the demand is not yet such as to insure for the manufacturers such returns as lumber of this kind should bring. All other hardwoods are in very acceptable shape, with the outlook encouraging and the free stocks hardly affording an adequate selection. Many inquiries are received from domestic buyers as well as from foreign countries, and gum especially is reported to show an improvement. Cypress is said to be easier, with the most pressing needs met, and the buyers now in a position to hold off a little and see what the near future may bring forth in the way of political and general business developments.

< BOSTON >

The hardwood lumber business has been checked somewhat by the materially higher prices that manufacturers and dealers are asking. All reports from manufacturing centers show that the offerings of hardwood lumber are small and in the majority of cases holders are very independent and will not make sales unless they obtain full asking prices. Buyers realize that today's market is firm and that the outlook shows no relief for some time to come, yet they will not purchase far ahead of their actual wants. Manufacturing consumers have been fairly busy, especially those making office furniture. Chair manufacturers have been exceptionally busy. The demand for interior finish has been excellent and mills in this section have been very busy. The demand for plain oak has shown quite a little increase of late, even though prices are higher. Quartered oak has been attracting quite a little more attention and prices are firm. The demand for maple is very good. Ash is attracting more attention.

< COLUMBUS >

Hardwood trade in central Ohio during the past fortnight has been active in every direction. The volume of business has been good and the price list is very firm. In fact, every change in quotations has been toward higher levels. The tone of the market is good and the future outlook believed to be excellent. The movement of the various grades has been uniform and as a result there has been no accumulation of stocks. The lower grades have shown the greatest strength, although there is a good demand for the upper grades, especially in oak and poplar. No trouble is experienced from a lack of cars.

Dry stocks are very scarce in every locality. As a result the price list remains firm. Mills have been making every effort to increase stocks, with the result that they have scarcely kept ahead of the demand. Dealers are buying well and so are the factories. Furniture concerns are good buyers since successful mid-winter exhibits.

Quartered oak is ruling firm and prices are high. Stocks are light. There is also a good demand for plain oak and recent advances have been recorded, especially in the better grades. Chestnut is one of the strongest points in the market. Poplar is strong and stocks are decreasing. Ash is moving better. Basswood is selling well and other hardwoods are firm.

< CINCINNATI >

Fine weather during the past week has been very favorable to the yardmen who are handling lots of lumber, both in-bound and out-bound. Trade conditions are very satisfactory; all wood consuming plants in the territory drawing supplies from this market are busy and well supplied with orders to insure a continuation for some time. All returning lumber salesmen after covering their territory do not hesitate to make this claim, and these trips are resulting in good bookings for both present and future shipment. The furniture trade is especially active at this time, and the implement manufacturers are very busy. Box factories are as busy as can be, and are constantly inquiring for suitable stock for their requirements. Planing mills are good users of stock and are working full time in an effort to get stocked up for early spring business. There are many inquiries for nearly every item on the hardwood list, and while quotations in answer to same are high, satisfactory results are being obtained.

The yellow pine and cypress dealers are all well pleased with the situation, having just about closed a very good year, and that right on the eve of the opening of another big building season. Mill prices are high and retailers are being urged to place orders liberally, but prefer to wait, expecting to find surpluses at mill points and thereby get some concessions. This is hardly likely as all mills are busy getting out export stock and railroad material for which there has been a very heavy demand all winter, and the yard stock produced at mills and remaining unsold at this time is very small, there being no accumulation. Therefore prices will remain firm for the present and advance as the season grows.

Plain oak is much the strongest on the hardwood list, and as high in price as dealers can remember. All grades in oak are so scarce as to cause some apprehension. Thick ash also is quoted high and is hard to locate. All other thicknesses and grades of ash are selling well. Quartered oak is doing nicely and prices are very firm. All low grades suitable for boxes are in active demand with low stocks to draw supplies from; top prices are asked for this stock. Chestnut is in active demand at satisfactory prices for all grades, G 4 sound wormy being most inquired for. Maple is in great demand and is becoming one of the strong items on the list. Cottonwood is also greatly improved in upper grades, while the No. 2 and 3 common grades are very hard to locate and are bringing stiff prices. Hardwood flooring is quite active for this time of the year, and prices are satisfactory, with indications of advances, which are necessary owing to the increasing price of rough lumber.

The increasing demand for good grades of poplar is very encouraging to dealers who have held good sized stocks waiting for a change in conditions. Low-grade stock is as scarce as ever and prices are very strong. Dealers believe now that there will be a good market for No. 1 com-

TIMBER TALKS

Looking Backward, 1918

I COULD have bought that tract of timber in 1913. It was offered at a low price on an estimate showing the quantity of lumber it would have produced had it been cut at that time. It is worth double that price or more today and through closer utilization it will produce one-third more in values than it would have under methods then in vogue. That would have been at least

166 per cent. in five years

Five years from now what will your conclusion be?

"I am glad I bought it,"

Or

"I wish I had bought it?"

If you live in the present, if you are interested in present opportunities rather than in reviewing those of the last decade, your conclusions will be "I am glad I bought it."

If you are a member of the Ancient and Slothful Order of Hindsighters you will tell future generations what might have happened, if—

James D. Lacey & Company Timber Land Factors

Portland, 1104 Spalding Building
Seattle, 1009 White Building

mon and better all this year, and also that wide stock will be in greater demand than for some time.

There is a splendid demand for all low grades of cypress, and good prices are being obtained. Planing mills are fair buyers of the better grades, but the heavy demand for this class of material will not come for about thirty days when dealers expect a very good business. No. 1 shop in all thicknesses is in good demand and growing stronger. Dressed stock for building purposes and hard stock is a little slow at this time, but the numerous inquiries for this stock is evidence of early buying. Prices are quite satisfactory.

TOLEDO

The hardwood market continues strong. Low grades are in heavy demand, crating and boxing materials being practically out of the local market. Oak continues a leader, with white ash a good second. Low-grade basswood is being called for and shows unusual strength, while firsts and seconds are slow. Hickory continues fairly strong. The demand for hardwoods seems to be greatest from Ohio and Michigan territory although inquiries are general and hardwood men are a unit in the opinion that the coming summer will prove one of the strongest seasons known on this market for many a long day. Building plans continue and embrace some immense work, both municipal and investment. Residence building has continued all winter, and it is believed that the coming season will embrace fully as much work as the season just past, which was the biggest known in this city. Sash and door factories, hardwood flooring concerns and column manufacturers are running their factories heavily for the season of the year and are making large plans for the summer business.

INDIANAPOLIS

There has been no material change in the hardwood market in this vicinity in the last two weeks. Business has been good and somewhat better than for the corresponding period of last year.

Prices continue stiff in all grades with no indications of any early reduction. All grades of oak are in special demand and the prices are much stronger than a year ago. There are many inquiries, which give promise of some nice contracts within the next few weeks. Most of the local hardwood concerns appear to have fairly ample stock on hand.

MEMPHIS

Business in hardwood circles is good and the movement of lumber is quite large. The demand is relatively better for the lower grades of cottonwood and gum and all grades of plain oak than for the other items. Offerings are rather scarce and this accounts for the fact that prices are so firmly held. There is scarcely a large buyer in the market for any one of the items who is able to secure prompt shipment of his needs. The movement of quarter sawn oak is fairly free and a satisfactory business is reported in ash. The upper grades of cottonwood are not as active as the lower but they are in reasonably good request. Red gum is in pretty good demand in all descriptions with the exception of 4/4. This is slow, as has been the case for some time. Sap gum is wanted at pretty full prices. Cypress is in good demand and indications are that there will be an active business in this lumber during the remainder of the spring, as building operations throughout the country are quite large. The demand for American hardwoods on the part of European importers and consumers is quite good and a large amount of lumber is being sent from Memphis to foreign markets. A considerable portion of the demand for plain oak is for export.

BRISTOL

Lumbermen of Bristol and this section report the lumber business as brisk. The unusually mild winter has enabled the mills to turn out much more stock than usual for the season of the year. The roads have been in fair condition and there has been much more hauling of logs and lumber than usual. Trade is better than for a long while, and the hardwood dealers say that the outlook is most encouraging. Further advances in prices are expected. The belief of the lumbermen here is that business will continue to improve rapidly during the spring and summer. They do not believe that the shifting political situation nor the prospects of tariff legislation will injuriously affect trade.

LOUISVILLE

Extremely favorable conditions now exist in the hardwood field, judging from the experience of local lumbermen. The demand is strong and general, prices are good, with a decidedly upward tendency, and stocks are in fair shape, though of course badly broken by the brisk demand along certain lines. Plain oak, for example, has not been allowed to accumulate, and any lumberman with an odd car or two of dry stock is usually able to dispose of it without any effort. Quartered oak is also improving, both the demand and the price being somewhat better than heretofore. The poplar situation is also better, for while good poplar is not particularly strong, common grades are moving briskly. There is an improved demand for wide poplar from carriage and automobile builders, and though the latter have been using metal to a large extent, it is beginning to look as if the automobile manufacturers are inclining

toward wood again, and consequently toward the use of poplar. If this turns out to be the case, there ought to be another boom in poplar such as happened a few years ago. The demand for ash is so great that the supply is altogether insufficient to take care of the wants of consumers. Car-builders particularly are buying it in quantity, and many customers are asking that shipments be made green from the saw. The outlook is for continued good trade. Everybody in the business world seems to have forgotten about March 4, and the belief here is that the change of administration will be accompanied by little or no uneasiness on the part of business at large.

◀ ST. LOUIS ▶

A very good trade condition is reported by the St. Louis hardwood dealers although the severe winter weather of the past several days has prevented the volume of business that was expected. In spite of this, however, the demand is most satisfactory. Oak and ash head the list as to demand, with cottonwood, gum and cypress following very closely. Poplar, No. 1 common and better grades, is not being called for very freely. Other items are in fair demand. Reports from the producing territory in the South continue to be most discouraging as to conditions. There has been much rain, which has prevented logging and if the present weather continues for any length of time, the cut for the first half of the year will fall much below the requirements. Dry lumber is exceedingly scarce at the mills, and this is most encouraging to the local dealers who have nice stocks on hand, as it will greatly enhance the values. As to cypress, there is a seasonable degree of activity being shown and prices are remaining steady and firm. St. Louis distributors are well pleased with the amount of business they are doing and the outlook. The demand from the northern territory is expected to increase as soon as the weather becomes more pleasant. Orders for factory stock are reported as most satisfactory.

◀ MILWAUKEE ▶

The unusually favorable weather in Wisconsin is proving an important factor in the hardwood business. Active building operations are under way, not only in Milwaukee, but all over the state. Farmers have been making the most of their opportunity to catch up with much delayed building, while there is also much activity in the smaller cities and towns about the state.

The shortage of stocks at the northern mills, especially in upper grade dry stocks, is causing considerable inconvenience. Wholesalers are forced to continually postpone delivery on orders. Stocks in the birch and maple line are particularly low and prices have made several gains during the past few weeks. Basswood, ash and elm are in good request, with stocks not especially large. Reports from the northern mills say that it is some time since stocks have been so low, and most of the concerns are behind on orders. The supply of plain and quarter-sawed oak is light and everything in No. 1 and No. 2 inch plain oak is absorbed as soon as it is ready to ship. Reports of flood damage in the South have sent prices up again.

All the local manufacturing plants, including the sash and door concerns, interior woodwork plants and the furniture factories, are placing some fairly good orders. Stocks on hand at most of these plants are light, and it is only fair to suppose that they will be forced to buy rather freely from now on, that they may be in readiness for the spring rush that now seems inevitable.

◀ GLASGOW ▶

The continuation of the carters' strike is responsible for business being decidedly quiet in the west of Scotland during the past fortnight, but once it is over, there should be a return of the active conditions existing of late. Many of the large works have been compelled to close down, through inability to get supplies. Some wood is being delivered, but this is applicable only to deliveries out of town. In these cases it is possible to get wagons alongside the quay and loaded.

The imports of birch logs so far this season have been disposed of, and the demand still continues active. Birch planks are also in good request, but until the present, arrivals have been few. Imports of wagon oak planks, which have been on a fairly liberal scale recently, are being readily absorbed, showing a continuance of the good condition of this branch. The steady movement in mahogany, oak, canarywood and gum is still maintained, and the consignments now about due should do well.

The shipbuilding industry is still largely responsible for the movement in evidence, and extensive demands are certain to emanate from this source for a considerable time to come yet, so much so that it is already being prophesied that another record year's output will eventuate, provided no serious labor troubles interfere. The prosperity of shipbuilding on the Clyde has been most phenomenal, and it is gratifying to think that the Clyde has surpassed all records in shipbuilding and marine general. The report show the output of the Clyde district equal to that of the whole north of England put together, exceeding that of Germany, and almost double that of the United States.

Quebec shippers have now put in their annual appearance in quest of contract business, but very little business has resulted. Some of the larger buyers have still quite a quantity of last season's import, so that there is little likelihood to contract at the current level of values.

Mahogany

In Veneers and Lumber

That is Mahogany

☐ Right now we can offer to the discriminating buyer a comprehensive stock of as fine Mahogany Veneers as have ever been produced.

☐ These Veneers are made from both Cuban and African wood; were cut from the pick of the choicest logs obtainable, and show a remarkable variety of figure of the most alluring character.

☐ In Circassian Walnut we can offer an equally attractive line of veneers, in fact, such a line of Circassian in character of wood, figure and manufacture as has never been equaled.

☐ In solid Cuban wood, largely four-quarter in thickness, we have a limited stock of exceptional character.

☐ At this time the Willey Mahogany and Circassian holdings in lumber and veneers are by far the best that can be shown in the United States.

☐ Intending purchasers of any kind of Foreign or Domestic figured woods and veneers are cordially invited to visit the Willey mills, and veneer and lumber warehouses, on Robey Street near Blue Island Avenue.

☐ Ready access can be had to the plant by taking a Blue Island Avenue car at the postoffice on Dearborn Street and alighting at Robey Street.

C. L. WILLEY, Chicago

Largest Mahogany Veneer and Lumber Producing Plant in the World

W H Y ?

WHY DO more than 320 of the most prominent and successful lumber manufacturers exchange nearly \$26,000,000 of indemnity against fire loss at

Manufacturing Lumbermen's Underwriters

B E C A U S E !

BECAUSE it is the oldest and strongest inter-insurance association among lumbermen, being now in its fourteenth year.

BECAUSE \$728,910.41 cash savings have been returned to members.

BECAUSE \$756,787.21 cash surplus, owned entirely by the members, has been accumulated.

BECAUSE \$2,012,427.96 has been paid in losses under prompt and equitable adjustments without resort to quibbling or technical controversy.

BECAUSE it was the first to settle lumber losses on a market value basis.

BECAUSE the regular, frequent and thorough inspections given the plants of all members help them to prevent fires, thus materially reducing both the fire waste and the cost of indemnity.

EASTERN REPRESENTATIVE, John L. Cochran
601 W. 115th Street, New York City

YOU pay a *little* more for our hardwood lumber than you do for many others', but it's worth *much* more.

With our modern and first-class equipment and expert operatives, we couldn't make bad lumber if we tried to, because the *quality* and *size* of our virgin tough mountain white ash, red birch, yellow poplar, buckeye, maple, red oak, cherry and basswood, averaging less than three logs to the thousand, and 95 per cent sixteen feet, is the best type of hardwood timber growth in the United States, and shows a larger percentage of *firsts*.

If you are a discriminating buyer, let's get acquainted.

The "What & Why" of McIlvain Service

With yards in the heart of the best lumber districts, we are able to fill practically any lumber order. Having fifty or more shipping points, we are able to facilitate prompt delivery. The size of our organization enables us to quote rock-bottom market prices. Our business has been built on giving our customers such service as would be a continual source of satisfaction—we would continue building.

An important feature of McIlvain Service is the monthly stock list—A postal will bring "Lumber News" regularly

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

The T. Wilce Company

22nd and Throop Sts. CHICAGO, ILL.

Welcome to Our City

When you are buying your ticket for a trip into the hardwood country, don't forget to tell the man to make Louisville, Ky., your destination. It's unnecessary to arrange merely for stop-over privileges, for the reason that when you get here we'll make things so interesting for you that it will be unnecessary to proceed further.

You know all about the traditional Kentucky welcome, of course, and it's taken for granted that you realize that this is still on tap, ready for wanderers like yourself who don't have a chance to enjoy life in God's country very often. But we've got more than a mere welcome; what is more to the point, we've got the goods.

In these piping times of good business, with everybody in the market for something or other, and a lot of items as hard to find as the storied needle in the hay-stack, the advantages of trading in a market like Louisville are even more apparent than at other times.

That is to say, you can get quartered oak, and plain oak, and poplar, and ash, and hickory, and mahogany, and veneers, and panels, and about everything there is to be had in the hardwood line, right here; it's a good deal like going into a department store and buying a refrigerator in the basement, a diamond ring on the first floor, a suit of clothes on the second and a dinner on the roof. Anything you may happen to want is here. If you don't see it, ask for it.

We'll be looking for you.

 HARDWOOD LUMBER Memphis, Tenn.

500 Copies Sold Within a Week After Prospectus Was Issued

Hardwood Record announces the issue on April 15, 1913, of an Authoritative Commercial and Scientific Book

American Forest Trees

By **Henry H. Gibson**, Editor **Hardwood Record**
 Edited by **Hu Maxwell**, Wood Utilization Expert

The Work Involves :

First: A botanical description of the more than 300 species of American forest tree growth.

Second: A physical description of the wood of these species.

Third: A recital of the chief uses of all important American woods, together with suggestions of advantageously broadening their uses.

Fourth: Complete information concerning the range of growth of all varieties.

Fifth: Related trees are logically grouped according to families and spe-

cies; important species covered in substantial detail, and brief mention of the woods of minor importance.

Sixth: Scientific name of each tree is recited, as well as the various common names by which it is recognized in different parts of its range of growth.

Seventh: The properties of the various woods are carefully analyzed, particularly weight, hardness, stiffness, strength, elasticity, toughness, color, figure, and seasoning and lasting properties.

☐ The book will contain between 650 and 750 pages, will be printed on the best quality of enameled paper, and handsomely bound in half leather, dark green roan back and corners, with basket cloth sides, silk head-bands, gold stamping on the back, and gilt top.

☐ The work will be illustrated with more than 100 full-page pictures on plate paper in sepia, outlined in orange, from photographs, covering all the chief commercial varieties of virgin forest timber growing in the United States; and also with numerous engravings, from drawings and photographs, showing leaf and flower forms, etc.

☐ The price of the work is \$6.00, delivered by express or mail, and is sold only on subscription.

☐ An order blank, and a prospectus, showing the character of the paper, size of page and style of printing will be forwarded on application.

Review and Outlook

General Market Conditions

ACTIVE INQUIRY AND PURCHASES have marked trade of the past two weeks, but there is no noticeable inclination in quite a few of the larger markets to purchase only according to immediate requirements rather than buy large stocks for future use. The wisdom of this policy on the part of the buying contingent of the lumber trade is very justly open to criticism inasmuch as such a policy is confessedly because buyers anticipate a break in present hardwood market prices. As iterated and reiterated numerous times in this column, the best evidence obtainable leaves no room for doubt as to the impossibility of there being any general recession in hardwood values for at least six months to come. It is not likely that the best element in the hardwood trade will make great efforts to raise present values to any great extent. There is absolutely no reason to believe that the present level will not be maintained or slightly increased.

Reports continue to come from the North that the log input has been disappointing in a good many sections, and that northern mills will not, in many cases, cut the amount of lumber which they had anticipated. Continued difficulty of logging is still noted in many southern points, and in fact the only really favorable logging conditions prevail in the southeastern hardwood sections, where favorable tides have brought down very satisfactory quantities of logs in rafts and drives.

The month of February was reported in most quarters as exceeding in demand and values the same month in 1912 by a very favorable margin. That month closes and March opens with an excellent demand from practically every source of consumption. Railroads are reporting plans for extensive improvements, such reports being issued from different railroad headquarters continuously. These improvements and additions embrace expenditures in rolling stock equipment as well as in stations, bridges and smaller structures.

All furniture exhibits during the past winter have been marked by unusually favorable purchases, and the demand for material by furniture houses is consequently very satisfactory.

Actual purchases until recently on the part of automobile manufacturers were not active inasmuch as these manufacturers were rather waiting the termination of the many automobile shows taking place in different parts of the country. However, the order books of most of the leading auto manufacturers in the country show that their outputs will be decidedly increased during the coming year.

No new conditions have developed regarding the export trade. Foreign business conditions continue on a par with the condition which has maintained for some time. Until recently the Scottish trade was held up and considerable confusion resulted from the

strike on the part of the Scottish draymen, but the latest advices are to the effect that the dispute has been settled by arbitration, and it is anticipated that former favorable conditions will soon make themselves manifest.

A general survey of this country reveals continued shortage of stock at practically all points, and in all woods with the exception of red gum in the better grades. Handlers of this wood report that there is some little accumulation.

The late winter has somewhat retarded the opening up of building operations, although reports from practically every important city in the country reveal the fact that building permits provide for decidedly increased building operations. Fifty of the largest cities report building contracts let during February which will average a ten per cent increase over operations for February 1912.

Wilson Inspires Confidence

AREMARKABLE UNDERTONE OF CONFIDENCE in the new administration at Washington is apparent throughout the country and the personality of our new President, his straightforwardness and apparent honesty of purpose have resulted in a sentiment distinctly favorable in all business circles. It is interesting to note, however, that invariably any comment on the change of administration treats of the new President as an individual rather than as an adherent to a political party so long in the background of national politics. It would appear from this that the body politic did not necessarily elect a Democratic administration but rather elected Woodrow Wilson, the man. That this feeling is justified is borne out by the expression of the new President in his inaugural address. He does not hesitate in saying that the interests of the country will receive first consideration rather than party interests. Judging from the way in which he has adhered to his promises in his past political connections, it is perfectly safe to expect that he will make every honest effort to put into effect such policies as he commits himself to.

The recent election and the change of administration have had some effect on business in some quarters, but the most pessimistic will not claim that it has had the deterring influence which is usually so apparent. Uncertainty has been the main contributing factor to any uneasiness of this kind and now that the new President has actually taken the administrative chair and has given some clew as to his ideas and intentions, there is still no apparent reason for legitimate business to have any apprehension as to what the newly elected administration may do.

In his inaugural address, which will undoubtedly in future years be considered as a classic ranking almost with Lincoln's Gettysburg address, President Wilson makes a direct and frank appeal for the

support of every forward-looking man imbued with a spirit of patriotism and there is no excuse for any honest citizen withholding such co-operation to the extent to which he has the power to give it, whether it be in the matter of mere moral support or through the medium of more powerful political influence. We have a democratic president and in spite of all dire forebodings he "looks good."

Front Cover Picture,—Mount Hood

THE ILLUSTRATION ON THE FRONT COVER of this issue of HARDWOOD RECORD presents a scene familiar to most readers. Those who have not seen Mt. Hood itself are acquainted with it through pictures. It had a prominent place in the geographies which most of us thumbed in the public schools; and in later years railroads, land companies, and promoters of northwestern resources have been liberal in their use of the conspicuous mountain as a center piece for some of their finest representations of scenery.

The great mountain is set for show. Rising to a height variously estimated at from 11,225 to 12,000 feet, it looms vast on the horizon when seen from the Willamette valley forty or fifty miles west. It stands head and shoulders above all the peaks and ridges of the region within a radius of fifty miles, and has no rival or competitor between Mt. Ranier, far north of the Columbia river, and Mt. Shasta which marks the termination of the Sierra Nevadas in northern California. The peak is an extinct volcano, and occupies a prominent place in a volcanic region of vast extent and formerly of great activity. The last glow of subterranean fire died out ages ago, and fields of lava now mark the course and direction of the flows which once inundated immense areas.

When seen from a distance, the shape of Mt. Hood betrays its volcanic origin. The long, gentle slopes lead to the peak from all sides. Ravines have formed low down the slopes, and these measure the amount of erosion which has taken place since the mountain-building process ended. The time since then cannot be measured in years, for human history is silent; but the work of weather and of running water shows that ages have passed since erosion began and the fires ceased their activity.

Though vast periods of time are recorded on the peak's face, yet Mt. Hood is young, as the ages of mountains are measured. Compared with some of the mountains of the eastern part of the continent—the Blue Ridge, for instance—it is an infant beside a Methuselah. Erosion has as yet had time only to scratch the surface of the western peak, but it has worn the Blue Ridge to the roots; has taken enough from its summit to overtop Mt. Hood.

A visit to Mt. Hood adds greatly to one's appreciation of its vastness and solitude when it is afterwards viewed from a distance. Most eastern people who have made its acquaintance have not been much nearer than Portland or the Willamette valley. From that distance in clear weather it shows grandly, particularly late in the afternoon when the sunshine is at the proper angle to give color to the snow and rocks.

Quashed at the Last Moment

ONE OF THE LAST ACTS of ex-President Taft before handing over the reins of government to President Wilson was his veto of the Sundry Civil Appropriation bill, which contained two amendments that would have resulted in rank class legislation. These amendments were introduced by representatives and each passed the House with a good majority. The first provided that no part of the appropriation should be expended in the prosecution of any organization or individual for entering into any combination or agreement having in view an increase of wages, shortening of hours, or bettering the conditions of labor, or for any act done in furtherance thereof, not in itself unlawful. The second provided that no part of the appropriation should be expended for the prosecution of producers of farm products or associations of farmers who co-operate or organize in an effort to obtain and maintain a fair and reasonable price for their products. These two amendments are so flagrantly in the interests of classes that it is difficult to conceive what influenced the House of Representatives to let them get by. The only reasonable excuse is that the labor and farmers' vote looked too good to them

to sacrifice. At the same time, an unpleasant spectacle is offered in the efforts of our national House of Representatives to pass such legislation while its courts are actively engaged in an effort to secure some evidence that would tend to prove that members of the lumber trade should pay excessive fines or go to jail because they have merely been trying to insure themselves a fair living out of the sale of their products.

Government Price List Discontinued

THE UNITED STATES FOREST SERVICE has recently announced that henceforth it will not publish the quarterly list of lumber prices which it has issued for five years. These lists were started in 1908 and originally were issued monthly. While in some instances they have not conformed to the ideas of all as to exact values, they have for the most part been an accurate guide to lumber prices throughout the country. They have been based on a vast amount of information obtained not from a limited number of concerns, but from representative mills in each lumber producing territory. The work has unquestionably been of material benefit to everybody connected with the manufacture, sale or consumption of forest products. At the same time, the Government has repeatedly announced that returns were not coming in as satisfactorily as it desired and that if the lumber trade would co-operate to a greater extent, the price lists could be made much more authentic than heretofore.

The reason given for the discontinuance of their publication is that various individuals and associations have undertaken the work of securing the survey of market values and that with these organizations in the field, there is no real use for the Government's continuing the work. It may be that the efforts to make a substantial cut in the the service. The Forest Service is undoubtedly better equipped than any association or individual could be to secure this information and it is surely to be regretted that it has felt it necessary to discontinue the work. It may be that the efforts to make a substantial cut in the appropriation for forestry work has had some effect in influencing the minds of those in charge of this matter.

An Insight Into Foreign Credits

THE AMERICAN EXPORTER is admittedly weak in his knowledge of the credit of prospective foreign customers. With characteristic American egotism it is considered that American business methods and American ingenuity of manufacture would successfully take care of the sale of his products, and for this reason he has not given his foreign sales department or his foreign credit department the attention which it justly merits.

In contrast to the policy of the American exporter, the painstaking efforts on the part of the British Government to closely analyze foreign markets is distinctly brought out, particularly in South America. These efforts have resulted in the acquisition of a vast trade to South American countries both from England and from Germany, while on the other hand American exporters, although they ship considerable quantities to the countries in South America, are not assured of a continuous and steady market there. This is merely an instance illustrating the lack of attention given to foreign market conditions and credits.

Exporters should be interested then in a publication of very practical value, which has just been issued by the Bureau of Foreign and Domestic Commerce at Washington. It deals with the much discussed credit problem, but presents it in a new way.

A part of the book is devoted to an exposition, by Commercial Agent Archibald J. Wolf, of credit methods and facilities in Germany, England and France, in which he shows how and by whom long terms of credit are granted in the export markets, what facilities make these extended credits possible, and the advantages and disadvantages of the system.

There is also included a review of present methods of financing foreign shipments from the United States, and an analysis of numerous letters from American manufacturers with regard to their credit practice in the export trade.

Furthermore, an important series of consular reports from all

parts of the world are included. In these reports the American consular officers describe fully local conditions. Thus the subject is considered from different angles, and the reader is given an accurate idea of what the exporters in foreign countries can and cannot do in granting credit; what American exporters are doing and can do, and what the foreign importer is accustomed to expect in the matter of credit from the American exporter.

As a supplement, the book is equipped with examples of forms for use in financing foreign shipments, and lists of banks in the United States having foreign departments, and foreign banks undertaking the collection of drafts.

The report presents the general foundations and principles involved, and also gives definite data that is of immediate practical value. It presents no ready-made solution for the credit problem, but sets forth rather the facts, and outlines the principles that should govern foreign credit dealings.

This publication as stated is issued from Washington under the direction of the superintendent of documents at the government printing office. The Government has been successful in issuing a multitude of publications of considerable importance practically at the mechanical cost involved. The book in question can be secured for the sum of thirty cents, which expenditure should be well justified by the vast amount of information it contains as enumerated above.

Poor Products Are Poor Advertising

IN A RECENT ISSUE of a Canadian contemporary is given an illustration of a door manufactured in this country, which is accompanied by a paragraph stating that the door was made of sugar pine with birch veneered panels, and that the veneer was warping and pulling loose due to poor quality of glue and workmanship. The article suggests that this is the character of a great deal of millwork sold on Canadian markets by American houses and that Canadian manufacturers of such products should make every effort to give publicity to these features with the idea of securing such trade for local manufacturers rather than letting it get out of the Dominion.

HARDWOOD RECORD does not believe that in any line of business knocking a competitor's products is good selling talk. It does not believe that the average American manufacturer of doors of any character turns out the line of goods as intimated in the article referred to. Nevertheless, American manufacturers shipping any line of finished product to any foreign country, either on this continent or abroad, should bear in mind the human proclivity to see the bad things in the world rather than the good. We are constantly led to believe that the world is growing worse because the newspapers give more publicity to murders, divorce and similar scandals. In the same way, a foreign manufacturer of products similar to those manufactured in this country might very readily use a few scattered cases in which poor articles were furnished the Canadian trade as evidence that American manufacturers are not up to the mark in quality of production and workmanship. There is undoubtedly a tendency among American manufacturers in all lines, not alone the lines dealing with forest products, to occasionally give too little attention to the character of the work going into the manufacture of products for export when such export market has actually been secured. The average American is perhaps fooled by the remarkable growth of industries and commerce of the United States into the belief that no other country is so well equipped to turn out as high class an article as is

our own; but in this he is far from right. The American manufacturer in all lines must lend every effort if he wishes to maintain the prestige enjoyed at present in all foreign markets by the American goods.

Accurate Knowledge Required in Introducing New Species

AN ADDRESS WAS RECENTLY DELIVERED by a prominent Londoner, treating of the efforts on the part of Australian manufacturers of forest products to introduce such products into English and European markets. There is a wealth of timber in Australia, particularly of hardwood. A good deal of this timber is of excellent quality. Australian interests have succeeded in establishing an extensive and elaborate testing laboratory in which woods from the various species are given crucial tests through which can be demonstrated their utility in different lines. Armed with reports of these tests, Australians have invaded European and English markets with the idea of demonstrating that the qualities of Australian timber entitle such species to general use in those markets. The success of these pioneers has not been very marked. The address referred to criticizes the method of introduction, stating that the average consumer is not at all interested in the mechanical properties of wood, but wants to know merely the color and general character of the wood texture.

HARDWOOD RECORD cannot subscribe to this, inasmuch as it has been its contention for years that knowledge of the adaptability of certain wood species for certain purposes and that the only way of acquiring this knowledge is through an intimate study of the structure of the wood of different species. Without technical data, the introduction of new species is based on mere guess-work. A certain wood will appear to resemble another more prominent species in color and character and for that reason it is supposed that

it will be readily adapted to the uses for which the old species is marketed. In many cases where a new wood is thus introduced, it will fall down absolutely when put to the test in the finished article.

No one will maintain that the efforts of the Forest Service in this country in the matter of supplying such intimate technical knowledge of wood structure have not been of vast importance and benefit to the lumber industry. Therefore the successful introduction of an unknown species requires first, accurate and reliable data as to the technical character of the wood, which data should, however, be couched as much as possible in practical terms; second, an intimate and practical knowledge of all the fields to which this wood might be successfully applied.

Substitutes for Circassian Walnut

ELSEWHERE IN THIS ISSUE of HARDWOOD RECORD may be found a review or synopsis of a circular on Circassian walnut published by the Forest Service. Users and admirers of this beautiful wood have long felt the need of more exact information concerning sources of supply, and the character and qualities of the product. It has been known in a general way what Circassian walnut is, and whence it comes, but many things relating to the wood itself and to the business of procuring and marketing it have not been clearly understood. The circular goes somewhat minutely into several of these matters. One point in particular will surprise many persons; for it is shown that English walnut which produces the nuts of commerce, French walnut, and that from Italy and Austria, are all the same

UNSOLICITED TESTIMONIAL

University of Missouri Columbia

COLLEGE OF AGRICULTURE
Department of Forestry

March 3, 1913.

Hardwood Record,
Chicago, Ill.

Gentlemen:

I want to thank you for your kindness in sending us the copies of Hardwood Record which we failed to get just after Christmas. I consider it one of the very best papers in the work I am handling here at the Forestry School that I can get.

Very truly yours,

ERNEST C. PEGG,
Instructor in Forestry.

species botanically. The principle difference is that Circassian walnut, as the wood is known to the trade, comes from forest-grown trees in their native home among the mountains of Turkey, Persia, and southeastern Russia, while the others are planted stock, the wood of which never equals that from the native range.

A point touched somewhat incidentally in the Forest Service circular is worth attention. It relates to imitations of Circassian walnut, and two well-known American woods are shown to bear close resemblance to the oriental product. They are butternut and red gum. The former does not appear to have been much employed as a substitute, but its color and grain match well with those of the eastern species, except specimens of the finest figure which may be readily distinguished from the best butternut. Red gum has been extensively employed as a substitute for Circassian walnut. The figure when carefully selected needs no doctoring to make it pass for the genuine article. Experts can tell the difference upon close and careful inspection, but the ordinary observer cannot. Large quantities of red gum successfully and satisfactorily pass as Circassian walnut in the markets of this and other countries when worked into products, such as furniture and interior finish.

The question may naturally be asked why it is necessary to sell red gum as a substitute or imitation. Why cannot the wood stand on its own merits? If it is as handsome and as serviceable as the genuine Circassian walnut, and such seems to be the case, why not sell the gum under its own name, on its own merit, and let it achieve a reputation for itself? It has been exploited under other names long enough and it is time for it to come into its own. It has been bought and sold in Europe for a long time as satin walnut, though botanists know of no tree by that name. The evident purpose of those who use the name is to pass the gum as some form or variety of Circassian, English, French, or Italian walnut, all of them being the same wood under different names. It is sold across the water as hazel pine or hazel wood also, which is clearly an attempt at disguise, though, strictly speaking, it is not a misrepresentation because red gum belongs to the hazel family, and is a first cousin of the small witch hazel of this country.

An Unfair Influence

THE FORWARD PROGRESS of civilization is necessarily marked by changes in methods of manufacture and in the raw materials used in all lines. These changes sometimes result in a distinct advantage to humanity but occasionally, on the other hand, the substitution of one character of raw material for another means the introduction of a commodity which is not as well qualified to meet the requirements as is the deposed raw material, and this introduction effects an unjust hardship to the manufacturers of such raw material. At any rate, the question will eventually resolve itself into a proper adjustment according to which each material will find its proper sphere of usefulness, and its encroachment on the domain of some other raw material will be limited. But this process of evolution should be natural and not stimulated artificially. It is to be regretted that any body of men possessing power of a certain kind but not directly interested in one class of raw material as opposed to another should throw its weight in the interests of the producers of one of those classes.

It has been suggested that the leading architects of the country through their organizations are lending their support to reinforced concrete construction as opposed to mill construction, the idea being that the less efficient architects are not equipped to design and supervise the erection of intricate reinforced concrete construction. The result of such a plan, if it were successfully carried through, is apparent. With the powerful influence of the big architects of the country working for the elimination of mill construction as far as possible and adhering to concrete construction, the effect upon the lumber business would be tremendous.

Must the Lumberman Be a Banker?

CONSIDERING THE WAY in which terms of sale are treated, the answer to the above query would be "yes." This is a question which has commanded the attention of the trade for a long time and it seems as far as ever from any concrete solution. Various associations at various times have inaugurated terms of sale

which govern the question theoretically very satisfactorily, but it seems to be an impossibility to legislate into the purchasers of lumber the practice of adhering to the terms of sale on which they buy their stock. The present and generally prevalent practice of ignoring discount terms and taking from ten to thirty days' additional time with the discount is a serious thing with the lumber trade and means in the aggregate immense loss of actual money. The average lumberman is forced to carry a considerable percentage of his trade for indefinite periods beyond the period of discount.

It would seem that the ideal terms of sale would provide for no discount whatever, although it is conceded that this idea is somewhat Utopian. It is presumed when the lumberman sells a bill of lumber that the stock is worth the price that he charges for it. Hence, it is difficult to see, considering the question in a theoretical way, why he should be forced to strike off two per cent discount. It is recognized that such a procedure, however, would be out of the question when applied to practical business methods. The reason for the discount provision is partly with a view of weeding out the good accounts from the bad. It is partly a matter of custom and partly a mere recognition of that human proclivity to consider the prompt payment of just debts something which we are not in any way morally bound to carry out.

Looking at the question from the first standpoint, the discount is a good indicator of whom not to sell to. As a general thing, a man who makes a practice of ignoring terms of sale and of not discounting his bills should be watched pretty closely in other matters. The habit of overlooking discounts would indicate either that he has insufficient capital or that he is morally a little off color in his business relations. Of course, if he is at fault in the latter particular, there is no apparent remedy. If, however, he is operating on an insufficient capital, but is sound morally and generally trustworthy, it would seem that the logical thing for him to do would be to borrow sufficient additional capital on a four to six months' basis to discount his bills. He would find that the difference between what he had to pay on borrowed money at six per cent annually and the saving he would effect through securing two per cent discount for payment within fifteen days of the shipment of lumber would be considerable.

As Predicted

AT VARIOUS TIMES IN THE PAST, HARDWOOD RECORD has had occasion to comment editorially upon the character of a certain so-called lumber company operating under the style of the International Lumber and Development Company, with headquarters at Philadelphia. HARDWOOD RECORD was never able to see anything in the nature of an honest, straightforward business proposition in this company and said so emphatically. These predictions have been backed up by proceedings against this concern during the past year, the latest news emanating from the court room where these proceedings are being held, being dated March 3. United States District Attorney Swartley on that date outlined the government's case against this company, proving beyond any reasonable doubt that the defendants defrauded stockholders out of \$6,000,000 by false representation and misleading literature circulated through the mails. It was shown that the reported immense holdings of the company in Mexico were fictitious and it was further proven that the semi-annual dividends paid by the company were paid out of money received for stock sales rather than out of profits. The district attorney submitted evidence to show that no actual dividends were earned in two years' operation. It was further shown that the reported cut of this company exceeded by two-thirds the actual cut, and further that the lumber manufactured was sawed from timber not cut on the company's lands, as had been claimed. The ridiculousness of some of the defendant's claims is instanced in the widely circulated reports of its immense international fleet; it was shown that this fleet consisted of one steamer, one launch, two sailboats and two rowboats.

There is only one possible outcome for these proceedings, and they serve as a striking illustration of the fact that "murder will out."

Pert, Pertinent and Impertinent

THE DEMOCRATIC SUNRISE

"I Can Use That Money Now, But I Wonder If It Isn't Preparing a Load for the Little Shoulders That Must Bear the Burden Later"

Meeting of Chicago Association

Editor's Note

The lumber trade is not so much concerned with the present condition of business, for present activity is too apparent to leave room for doubt. On the other hand, however, lumbermen seem to be seeking information as to the future trend of the lumber business, both in the immediate future and during the next few years. The following article contains an unusually able speech by J. E. Rhodes, in which the question is analyzed in an authoritative and complete manner.

The monthly meeting of the Lumbermen's Association of Chicago, held at the Hotel La Salle on Tuesday, February 25, was productive of unusually profitable information and discussions. The meeting was preceded by the usual pleasing luncheon.

Immediately following the gastronomic feats, the newly-elected president, Murdock MacLeod, opened the business session, outlining in a general way the plans having to do with the regular meetings of the association for the coming year. With the exception of the summer months, the year will be marked by a meeting every thirty days in conjunction with a luncheon or supper.

Mr. MacLeod suggested that there are a multitude of subjects which can be profitably brought up at such sessions, and that it is his aim at future meetings to have a discussion of market conditions and general business conditions having a bearing on the lumber business.

President MacLeod then introduced J. E. Rhodes, secretary of the National Lumber Manufacturers' Association.

Mr. Rhodes first said that Chicago is recognized as the largest lumber market in the world, and further that he fully appreciates the conditions which have made possible the transferral of his personal interests to Chicago. He outlined the purposes and personnel of the National association, showing that it is designed only for the consideration and treatment of problems of national interest, and that it does not consider in its scope the consideration of the smaller questions and details of the various branches of the lumber business. He told of the varied and extensive interests making up the membership of the National association as embodied in the various allied associations belonging to it.

Mr. Rhodes referred to the maintenance of a credit rating department by the association as one of its most important features, and said that in the near future the Blue Book, published by the National Manufacturers' Credit Corporation, a subsidiary to the National Lumber Manufacturers' Association, will open a branch office in Chicago.

Referring to the long anticipated forest products exposition, the speaker said that it has been decided that the possibility of the early inauguration of a general lumber advertising campaign is precluded by the lack of available funds, but stated further that in place of inaugurating such a campaign, active steps are being taken to put into concrete shape plans for the proposed lumber products exposition. He said that the first exhibition will be made in Chicago next fall.

Referring to the scope of the National association's efforts, Mr. Rhodes said that his organization is lending every aid possible to the general move for the purpose of removing the national tariff question from politics, and in favor of creating a permanent tariff commission to adjust tariff questions and rates in a logical and businesslike manner, independently of political conditions.

Another national question to which the association is lending its strong support is monetary reform; the revision of the present Sherman anti-trust law is also being advocated. The speaker said that if these three questions can be carried to a conclusion in keeping with the desires of the important business element of the country, the possibility of financial panics will be eliminated, and the only hard times will come from crop failures, wars and similar national catastrophes beyond the control of mankind.

The speaker then proceeded to a discussion of general market conditions. He said that with a membership of 1,400 large saw-mills cutting 13,000,000 feet of lumber annually, there can be no room for doubt as to the absolute groundlessness of the suggestion that there is a lumber trust maintained by large lumber operators, who are members of the association. He further said that the

government's census report shows that there are 36,000 large mills operating in the United States, which cut a total in 1910 of 36,000,000,000 feet of lumber. The idea of such a multitude of individual concerns being controlled by any concentrated interest is too absurd to be worthy of consideration.

In speaking of Pacific coast conditions, Mr. Rhodes said that this section of the lumber industry suffered heavily following the panic of 1907. Its products were sold below cost in many cases, and a multitude of firms failed. Business there has attained a satisfactory status only within the last six months. According to the speaker there is every reason for believing that this condition will be maintained for at least six months to come. The hard winter in the logging districts of Washington affected a very decided shortage in fir logs, and in consequence of this, in addition to the healthy demand, prices have been steadily advancing for some time.

The speaker's analysis of the effect of the Panama Canal on the general lumber business was particularly able. He maintained that no direct effect will be felt for at least five years, arguing that in order to ship lumber through the canal from the Pacific coast points to the eastern markets it is absolutely essential that boats carrying as large a load as 5,000,000 feet, and capable of being loaded and unloaded in two days be built. The present boats being used are generally speaking much smaller than this, and practically without exception require as much as three weeks for loading and unloading. It would hence be manifestly necessary to have return cargo in order to operate these craft at a profit.

Under present conditions there is no cargo that could be taken back with the exception of coal, and inasmuch as the Pacific coast sections are producing considerable quantities of coal, any effort to ship these would hardly be successful. Another serious drawback would be inadequate wharfage to receive large shipments of Pacific coast stuff at eastern ports.

Mr. Rhodes qualified his remarks with the statement that what he had said applied to Pacific coast lumber, but that Pacific coast timber would, as in the past, be extensively used in eastern points. Mr. Rhodes said there is anticipated on the coast an advance on stumpage within the next year, which would result in a decided advance in Pacific coast lumber products. Any increase on these products would result in proportionate increases on all lumber products.

The speaker next analyzed conditions in the yellow pine field, stating that the apex of yellow pine production was reached in 1909, when the yellow pine cut was more than one-half of the total cut of the country. Conditions in yellow pine have a direct effect on conditions of all classes of lumber marketing. He said that in addition to the naturally forced reduced cut, the marvelous development of the South calls for an increasing amount of lumber for local consumption. He made the interesting observation that the state of Texas now consumes more lumber than it produces.

In analyzing the yellow pine values, the speaker said that the average price of yellow pine at the mills is at present from \$17.50 to \$19.50, and that it is anticipated there will be a rise in values from one to two dollars in the not far distant future.

Mr. Rhodes said that in 1911 twenty-eight yellow pine mills began operating, and that they cut during that year 156,000,000 feet of lumber, but he said that during the same period, ninety-seven yellow pine mills cut out their timber entirely, which mills had manufactured during that year 500,000,000 feet. Two hundred and fifty large yellow pine mills cut seven per cent more in 1912 than in 1911, but they shipped ten per cent more.

In speaking of northern pine, the speaker said that in 1911 the

cut was 1,500,000,000 feet, and in 1912, 1,000,000,000 feet, and that on January 1, 1913, there were 818,000,000 feet of northern pine lumber on hand, but that this was 160,000,000 feet less than on January 1, 1912.

In speaking of the cut and shipments of northern hemlock and hardwood, the speaker said that the total hemlock and hardwood cut was nine per cent less in 1912 than 1911 and the shipments twenty-eight per cent more.

In referring to the Inland Empire, where mills are manufacturing white pine, Mr. Rhodes stated that cut and shipments had both increased satisfactorily, but that shipments have increased at double the rate of cut. He stated that the pine of the Inland Empire will be an increasing factor in the eastern markets, and that stock at present is very scarce.

In speaking of conditions in the hardwood field, Mr. Rhodes stated that the open winter in the North has militated seriously against getting in a satisfactory amount of logs, and that while operators had anticipated a large cut this year, they will actually manufacture a decreased amount of lumber.

Mr. Rhodes said that the increasing population and the decreasing timber supply have a constant tendency toward raising prices, and said further that increased values are more or less periodic, the trade now experiencing one of these periods.

The speaker maintained that lumber prices would never be as low as they had been in the past. This increased value has a future significance in that with the greater value of forest products more attention must be directed toward perpetuating the supply. He said that we are merely repeating history as is shown in forest conditions in Germany. The growing worth of the product of the forest, and hence their growing economic importance to the nation, will necessarily result in a strengthening sentiment on the part of the public demanding some voice in the administration of the lumber industry. He said that this sentiment will take the form of a demand for government supervision of manufacture of privately owned timber, of the timber tax question, forestry, forest fires, etc. He said that while the question is not immediately imminent, it is commanding increased attention constantly.

He said that the present excellent condition of the lumber business is but a step in the development of this ultimate condition, and that eventually cut will be regulated by forest growth, and prices will be extremely high. The larger lumber interests of the country having a long time investment in forest lands are treating this question broadly, and are already considering the practicability of administration along more advanced lines.

Mr. Rhodes made the startling statement that in twenty-five years yellow pine manufacture as a national industry will be no more, and that at the end of that time it will have been reduced entirely to a local status, but that it will always be maintained as an industry treating of local interests.

Mr. Rhodes closed his remarks with the assertion that never before in the history of the lumber business have conditions been so generally good as now. In all sections of the country, where is manufactured every kind of forest product included in American lumbering, the demand is actually in excess of supply.

Following Mr. Rhodes' talk, in answering a question as to the effect government owned timber will have on the lumber business when marketed, he said that one-third of the standing timber is owned by the government, but that it has thus far been sold in small lots at prevailing market prices. He said that restrictions in logging, which must be recognized by those purchasing government timber, make it difficult to compete with operators in privately owned stock on the part of those cutting and sawing government stumpage. He said that the policy of the Government has always been against the creation of large operations in government timber, and that government lands will never be thrown wide open.

In speaking of the possible effect on shipments of lumber from the Canadian Northwest with the removal of the lumber tariff, Mr. Rhodes said that at present the British Columbian forests have no great amount of lumber which would find a logical market in the United States. He said further that the astounding develop-

ment taking place in Canada will create a market for practically all of the products of the Canadian mills, but the speaker contended that present marine laws in effect in this country, which restrict shipments of products in coastwise trade to vessels of American register and manned by American seamen, is an unjust burden on American manufacture. He said that if these laws are not radically changed, Canadian lumber will on the opening of the Panama canal be marketed extensively in the eastern cities.

George J. Pope then told of the work of the special committee appointed to consider the question of the erection of a building for the housing of lumber concerns and allied industries, which will house also the Lumbermen's Association and the Lumbermen's Club.

E. A. Thornton told of the recent decision on the part of the Interstate Commerce Commission at Washington regarding milling-in-transit tariffs, stating that the creation of milling-in-transit tariffs are now left entirely in the hands of the carriers, who are, however, to be governed entirely by present statutes on this question. He said that shippers should request a voice in the formation of any such tariffs with the idea of insuring their being just to the shipper.

F. L. Brown moved that a resolution be adopted thanking Mr. Rhodes for his able talk.

The meeting then adjourned.

White Cedar from British Guiana

Those who have studied the tree flora of British Guiana are well acquainted with the tree locally called white cedar. It is not one of the cedars so common in the United States, nor is it the Spanish cedar (*Cedrela odorata*), but belongs to the Bignonia family of plants and is known botanically as *Tabebuia longipetals*-Baker. The Indians in British Guiana call this tree warikuri or waracoori. It is found here and there over the less wet parts of the savannas, and wherever the forests are found on drier ground it is more or less abundant. Along the banks of the rivers that intersect the drier regions it is plentiful. White cedar grows most abundantly up the Lamaha canal that leads into Georgetown. The largest trees usually attain a height of from fifty to seventy feet, and from fifteen to eighteen or twenty-one inches in diameter. The logs generally square about ten inches. With the exception of its bark it bears no resemblance in any of its parts to the red cedar, which is the local name for the Spanish or cigar-box cedar.

White cedar when full grown is a dark brown, hard, heavy, and close-grained wood with a white sap, very durable, especially under ground, but splits on exposure to the sun. It is probably the best wood procurable in British Guiana for foundations. The wood is as easily worked as white pine, and is serviceable for all kinds of indoor work in building. It is also useful as a furniture wood, and where lightness of material is required might be largely used. The grain is straight and fine and the wood takes an excellent polish. Inquiries have been made for the timber for export, to be employed as match wood, for which purpose its lightness and straight grain particularly adapt it. Residents on the rivers use it in house building and for many other purposes. Those who are well acquainted with its qualities and merits say that for interior finish one of its principal recommendations is that it is never attacked by wood ants. This is a very great merit in a tropical country where the white ants are so destructive to wood.

The leaves are simple, about six inches long; the flowers white, of the size and form of the catalpa tree so common in the United States. The flowers are succeeded by elongated pods that are filled with flaky membranous-winged seeds. The white cedar was first described in 1888 and named by Mr. Baker, which proves another of the many instances of very common and useful trees that have awaited so late of *Tabebuia* in British Guiana. These trees resemble *prima vera* which is considered one of the most beautiful trees in tropical America. The white cedar is also highly esteemed for shade and ornament, and recently has been introduced into Georgetown, British Guiana, where it is easily cultivated.

L. L. D.

With the Veteran Panel Man

"I am not much of a word juggler," remarked the veteran panel manufacturer, smiling over an order which had arrived in the afternoon mail, "but it occurs to me that furniture dealers handling the output of a concern we have just heard from are going to have the job of explaining about veneered goods simplified a good deal."

"What's the system?" inquired a visitor who had dropped in to pass the time of day.

"Selling veneered oak or mahogany, as the case may be," he replied, chuckling, "for solid without making any misstatements about it. It saves time and conscience, I suspect."

"But don't you believe," broke in the other, "that it's best to come right out and tell the ultimate consumer that veneered work is veneered, and why it is better than the other kind? Why run the risks incident to deception of that kind when the benefits are so negligible?"

"That's all right, too," said the panel expert; "but what I have in mind is perfectly legitimate. As you will see by this order, we are going to supply some tops and panels for this furniture house, and are going to use oak cores, along with our figured quartered oak faces; so that it will be a plain matter of fact to say that the furniture is made of solid oak, since nothing but oak will have been used in producing it."

"You think, then," suggested the inquirer, "that this is going to be a case where discretion is the better part of valor, and where diplomacy will beat a stuffed club?"

"That's about it," was the reply, "although I am far from urging a retail dealer to back down and out on the question of the advantages of veneered goods. The trouble is that most of them are too willing to do it anyway, and goods made up under the specifications of this order enable them to make their selling talk truthful and at the same time accord with what may be the prejudices of the customer."

"Speaking of the use of cores of the same material as the face veneers, the practice is getting to be rather general. In fine work particularly it is desired, as this makes it unnecessary to veneer the edges of the panel or to band-rim the core with material similar to the face. Of course, the cross-banding is exposed, but its thickness is not great enough to cause any trouble. A lot of mahogany panels are now made up with mahogany cores for musical cabinet work. In a good many instances these panels have to be cut out in various ways, exposing edges which would be hard to veneer; and it is thought to be cheaper, as well as more effective, to use mahogany all the way through, instead of trying to save a little on the material and risk an unsatisfactory job."

"Occasionally lumber prices are in favor of using this plan, too. For instance, chestnut is pretty scarce at present, and I have an idea that I may be able to pick up some wormy oak that can be used on this job at a figure little in advance of what the chestnut would have cost. Oak of all kinds is high at present, though, and this may be difficult. But by studying the conditions of the market, the panel man can frequently take advantage of the opportunity to do the job a little better than otherwise and at not a great deal of additional cost."

"It is bad policy, however, to do special work of this kind without making a charge for it. If your customer specifies oak cores, then he ought to pay a price in keeping with the specification. The panel man should be given leeway in the use of core material, and if the consumer takes it upon himself to determine what it shall be, a higher price should be charged than when this feature is left to the discretion of the manufacturer. In the case cited, the oak may cost a good deal more than chestnut cores, and the cost of the panels to the buyer must be increased accordingly. On the other hand, it would be bad policy to make the same charge one time because lumber prices warranted it, and then attempt to raise it another, as a result of changes in the cost of material. It's better to have a general rule on this subject and stick to it."

"Another reason for using cores of the same material as the face veneers is that this material is usually stronger than that ordinarily used for core-stock. In other words, when your panel is going to be subjected to a good deal of strain, it is unwise to put in core material that is not calculated to stand up under it. Table material is frequently made up in this way, because the principal consideration is strength."

"This is a good deal like some furniture manufacturers I know, who are using mahogany to a large extent. They even enamel over mahogany, largely, they say, to avoid the necessity of having to veneer the backs of their drawer fronts. They figure that the cost of the veneering and the cheaper character of the material would make their article less attractive to the trade, and so they go to what seems on the surface to be an unnecessary expense in order to be able to offer something good. That shows knowledge of human nature. A lot of people will buy a mahogany bedroom suite, even if it is enameled, and pay the higher price asked for it, without question. Like the woman who wears hand-embroidered lingerie, nobody sees it, but she knows it's there and gets a lot of satisfaction out of that fact."

"That apparent disregard for material costs is not in keeping with the modern cry about the excessive waste in woodworking plants, is it?" suggested the visitor.

"Well, you know enough about the waste problem to realize that a lot of the talk on the subject is beautiful sunshine," replied the panel man. "Incidentally, I have just declined to renew a contract with a manufacturer of refrigerators to whom I was selling a big quantity of $\frac{3}{8}$ " three-ply glued-up plain oak panels. They were of exceedingly small dimensions, and when we first landed the order we thought it was going to be a great thing for the factory, and enable us to get rid of a lot of plain oak that would otherwise be a total loss. The price per foot we quoted looked pretty good, compared with the figures on larger panels, which would require the cutting up of fresh sheets."

"We happen to have a cost system that is pretty effective, and by the time figures on all the factors entering into the cost of production were available, we discovered that we were presenting our refrigerator friend with about \$16 on every thousand feet. The cost of handling the small stock, the greater difficulty in working it and the decreased efficiency of our presses in taking care of that kind of stuff operated against its being a profitable venture, and we have dropped the proposition like the proverbial hot potato."

"The only way to make money out of business of that kind would be to charge just as much for the material as we would if no waste were going to be used; and of course the consumer doesn't want to pay as high prices as that would result in."

"I would like to gamble that many people in our business who are burning up a lot of money in labor expense to get value out of their offal will find, if their cost systems serve them properly, that the business isn't going to produce enough of a profit to enable an extra dividend to be declared."

Car Statistics March 1

Statistical bulletin number 139 issued by the American Railway Association states that the total surplus of freight cars March 1, 1913, was 58,529, and the total shortage on the same date was 27,148. The total surplus February 15, 1913, was 52,700 cars, while the total shortage on that date was 30,517 cars. The total surplus February 28, 1912, aggregated 44,984 cars, while the total shortage February 28, 1912, aggregated 37,142 cars.

Compared with the preceding period as last reported in the regular bulletins, there is a decrease in the total surplus of 5,829 cars and further compared with the preceding period, there is a decrease in the total shortage of 3,369 cars. Compared with the same date of 1912 there is an increase in the total surplus of 13,545 and a decrease in the total shortage of 9,994.

Woods Used for Walking Sticks

Walking canes have for many years formed a distinct trade, and the stock exhibited by retail dealers is often very attractive, not only because of the variety of the canes, but also because of the beautiful finish and artistic styles. Hundreds of tons of sticks are cut not only in this country, but are imported from all parts of the world, solely for use as walking canes. Immense quantities are constantly being brought from the East and West Indies, South America, Africa, China, Java, and Singapore. From the latter country come all the varieties of bamboo known in the trade by distinct names, such as the "dog-head" cane, so called because a portion of the root is left attached to the stick, which, having two protuberances like ears, gives it a striking resemblance to a dog's head. These trade names are not familiar to botanists; they are usually more adapted to convey to the popular mind the appearance of the cane than to indicate the botanical nomenclature. Though so many varieties of bamboo are constantly imported from China and Japan and very largely used, nothing definite is known as to the species producing them. About fifty years ago a very beautiful stick was introduced from Borneo under the name of Rajah cane, the hardness of this stick, together with its beautiful markings of dark lines, caused it at once to become very popular. The name Rajah is said to be derived from the fact of the export duty which the Rajah of Borneo claimed. While enormous quantities of this material were and still are being imported, nothing is known as to its botanical origin further than that it is the stem of a palm.

A favorite cane is made of pimento wood, or allspice (*Pimenta vulgaris*). This is more particularly adapted for umbrella handles owing to its extreme rigidity and strength and its non-liability to warp. This wood is imported from the West Indies often in rather large billets and with a crook, from which a knob or hook is formed. Many of the canes made of orange and lemon wood are also derived from the West Indies and they are among the most highly esteemed of all woods used with the bark on. These are valued on account of the white lines seen so abundantly on the highly polished bark. They are also employed for umbrella handles, the bark being removed and the stick smoothed for this purpose. The orange canes may be easily recognized by the beautiful green bark, with fine white longitudinal markings, and the lemon can be detected by its symmetrical proportions and the regularity and prominence of its knots.

The well-known Malacca cane (*Calamus scipionum*) also makes a very beautiful walking cane. It does not come from Malacca, as its

name would indicate, but is imported from Siak in Sumatra. These canes are valued according to the length of their internodes; a perfect stick of the required length taken from between the nodes often brings a very fancy price. A genuine Malacca cane should be finished in the natural wood and have the proper taper. Many of those in the market have had their nodes worked down and after they are stained, painted, and polished, they are extremely difficult, except to a practiced eye, to detect from a natural Malacca cane.

A great many sticks are imported into the United States, either directly or indirectly, from Algeria, where these kinds are grown for commercial purposes. The kinds derived from Algeria are the pomegranate, olive, myrtle, and the leafstalks of the date palm. All these, especially the olive and myrtle, have been and are still in great demand. In addition to these a number of English-grown sticks are shipped into the United States. The principal ones are ash, oak, elm, holly, hornbeam, blackthorn, cherry, maple, hazel, crab, aspen, box, and the common furze. The medlarwood and chestnut are occasionally imported into this country. Guelder rose (*Viburnum opulus*) a native of Europe, is sometimes imported under the name of teazle or Balkan Rose. The young saplings of the ash, whether of native or foreign growth prepared with the bark on, often require very little treatment at the hands of the workmen except in forming the heads. After they are cleaned and polished they make excellent canes. Very few of the foreign ash saplings are in their natural condition sufficiently straight for use as walking canes, and require straightening. The Carob (*Ceratonia siliqua*), quantities of which are imported from Algeria, must be straightened by mechanical means. The method of straightening has been described as follows:

"The canes are buried in hot sand over a stove until they become quite pliable. In front of the heap of sand in which the rough sticks are plunged is placed a stout board, five or six feet long, fixed at an angle inclined from the workman; in the edge of this board are square notches. When the stick has become sufficiently pliable by being buried in the hot sand, the workman places it in one of the notches, and strains and bends it till he has succeeded in producing a perfectly straight stick. In this way the most crooked, and, to all appearance, worthless sticks, are made so straight that the result appears almost impossible, more especially when it is borne in mind that the workman has no other guide but his well-trained eye to help him. When straightened to his satisfaction the sticks are placed on one side and as they cool they become perfectly

CANE AND UMBRELLA HANDLES

rigid." This is an important step in cane manufacture.

The application of heat is an important element in the operation of the cane maker. The same power which makes a crooked stick straight is applied to make a straight one crooked, and the hard, brittle stems of the bamboo, the partridge, and the Rajah canes, as well as the various kinds of material obtained from Europe, where nature has not provided any kind of knob or crook, are by the application of heat curled into the necessary shape to form a handle.

Large quantities of canes are made in England, Germany, France, and other parts of Europe, where they can be made for less than they can be manufactured in this country. For that reason the United States imports many canes in the finished state from the large manufacturers in England and Germany. France ships in here very tastefully-mounted canes, and Germany sends the best kinds of ebony and painted canes of all sorts. For substantial and selected class of canes the German manufacturer is noted, not only at home

but in the foreign markets. Large quantities are exported annually to North and South America, as well as to other parts of the world. The following is a partial list of the woods now used for making canes, classified according to their origin:

Algeria—Olive, myrtle, pomegranate, carob, medlar, orange and lemon, eucalyptus, chestnut, cork, juniper, baytree, date palm leaf stalks, wild bamboo.

Tropical America—Pimento, coffee, flowered ebony, soapwood, briar, supple jack, orange and lemon, yellow sanders, myrtle, snakewood, black torck, gru-gru, wild bamboo, niob, greenheart, and sucupira.

England—Blackthorn, oak, crab, warted crab, whitehorn, hazel, maple, furze, ground ash, holly, hornbeam, birch, mountain ash, cherry and dogwood.

China—Ordinary yellow-root bamboo, tonquin reed, Carolina reed, dog-head cane, betel cane, whangee, whampoa bamboo.

Australia—Midgeu, Cardwell, Loya, bramble.

Other kinds from the East—Partridge (cane, Penang lawyer, Malacca, Siak, Rajah, root rattan, Bakow (a palm), jungle (a palm), ebony, zephyr, chi-chi, teatree (not tea), and Assyrian thistle.

Wholesaler's View of Co-Operation

Editor's Note

The following communication is from a prominent eastern wholesaler, and contains an exposition of his views on the question of co-operation as advocated in an address delivered before the recent meeting of the Hardwood Manufacturers' Association of the United States, which address was printed in full in the February 10 issue of HARDWOOD RECORD.

A few weeks ago at a lumber association convention a well-known hardwood operator spoke on "The Co-operative Spirit." It was a good talk in general, and some of the facts as presented by this gentleman were very true and the people at whom they were aimed should take hint and mend their ways.

In the second paragraph of this address, as printed in the February 10 issue of this publication, the writer enumerated a list of ills that are felt by manufacturers in general. The present writer has been at the manufacturing end of the game in past years and can fully appreciate what the "co-operative" spirit would mean if rightly applied to each and every branch of the business. But the trouble is that unless it is adopted at each successive step of the trade-channel and carried out by all, it will be useless to think of it. That is why all co-operative schemes, or nearly all, have failed.

After all, when we have a lot of criticism fired at us, the best thing to do instead of "getting our fur up" is to investigate the matters deeply and see if there is just cause for the kick. At the manufacturing end in past years, before he became a wholesaler, the writer had just as many troubles and was in hot water most of the time, and yet nine-tenths of the claims were just and proper. The wholesalers he found in general were a fair and high-minded lot of business men, with much better and clearer ideas of merchandising and sales than he had, and as a consequence the only just and proper thing to do was to investigate and learn. The writer is not throwing this at the gentleman named above, but is simply citing instances. Some years ago—just to show how some mills handled their accounts—a certain mill took an order and shipped a car to an eastern wholesaler—a man of undisputable reputation. There was trouble on the stock on account of inspection—in fact, it was refused. The wholesaler, however, like most of his class and with a disposition to help out on a car that was badly handled at the shipping end, quickly passed it on to another consumer and with but small deduction to the shipper. The latter, however, went completely up in the air, so to speak—branded the wholesaler as a robber and closed its books against him. Incidentally, the wholesaler, with a view of bettering conditions for this mill, made several suggestions as to the grade and the way it should be put up for that market. If this were done, he said, a large and profitable business for both could be built up. The changes necessary were simply to ship in accordance with the rules. This showed a disposition to work along co-operative lines. Did the mill profit by the other's better ideas of merchandising? It did not. Now let's see what happened further.

The mill sold a similar grade to another wholesaler in that town and the same thing happened, and for a third time the affair was

repeated with still another wholesaler. Then the mill refused to ship anything more to that market and branded the whole crowd with his private unregistered opinion. In each case the fault was with the mill. The grade was poor. The mill refused to acknowledge it and would not even question its inspector. The wholesalers received scathing letters in answer to their criticism. A manufacturer in any other line of business would have immediately investigated at his end and if wrong would have thanked the wholesalers for their criticism and said that the trouble would be at once remedied and that he would hope for still further business. Well, after some years of trouble this manufacturer *was compelled* to remedy his grades. This example is an illustration of only one phase of the business.

The writer of the article referred to states that there are charges that even the organizations are dominated and run solely in the interests of certain big mills. It would not seem to the writer that such a condition exists, although he is not in a position to take one side or the other; but the remark above suggests a thought. It seems that there should be a real school of training maintained by the associations. To go into the thought further it would seem that in such a case there should be a chief deputy inspector for say quartered oak, plain oak and gum; another for birch, beech, maple and ash, and so on, they all to be under the direction of the chief inspector, a man who is unquestionably first in his profession. At least twice a year all the inspectors of the association should be called in to the main office and thoroughly examined and drilled in any changes from the rules in use before. If this were done there would be no cause to complain against the association inspections, and it would be up to every manufacturer to send his inspectors to be trained by the deputies. Excepting from the most critical consumer, you would then have no kicks or refusals based on the grade of your stock. Such a step might also have the effect of effecting a unity of purpose between the two associations, which result we have all been trying to accomplish for some years.

To get back to a further discussion of the co-operative spirit—the gentleman is perfectly right in saying that manufacturers should make their own inspection rules. The wholesalers and consumers should be left out of it. The wholesaler, unless he finances the mill, is in reality but a factor of distribution. His suggestions, however, if practicable, should be taken in account. The consumer should be entirely left out of the making of rules for the manufacturers. Some grade that is standard will fit his requirements, just as the gentleman suggests. When there is a real standard of inspection rules there will be less of a deviation of prices for all grades—provided the widths, lengths and dryness as well as texture is the same or nearly so. This would redound

to the benefit of all the mills. It should further work to the interest of the wholesalers in general. A mill that maintains a sales force must get from two to three dollars a thousand more for its stock than a mill that sells through a wholesaler. The wholesalers can then sell at the same price as the mill first mentioned and yet prices all around will be the same—in fact, in the first case the mill can quote the wholesaler the lower price and do a greater volume of business.

The gentleman speaks of grade-stuffing. He is right. There is nothing the legitimate wholesaler has a harder fight against than this evil; but there is another thing (and it should be called an evil) which is detrimental to good business and is against good merchandising policy, namely, the practice of putting up especially fine grades to sell at the same price as the bulk of manufacturers charge for the standard or so-called standard grades. The writer has in mind one West Virginia manufacturer who puts up a grade of number one common that contains about a third of ones and twos. Yet he sells it at a price sometimes less than the market, but mostly at the price of the market. Is it good merchandising to give away cold, hard-earned dollars? The writer wouldn't say a word if this manufacturer asked a price equal to the value of the stock, but this is rank injustice to other manufacturers of a like grade and kind, as well as a big loss to himself. The writer puts up a grade of red gum that is at least five per cent better than that usually shipped, but he gets a proportionately higher price than the market for the stock. That is, in the strictest sense, good merchandising and, in fact, the only right policy. It seems to the writer that here is a field for co-operation, and perhaps some education administered to these manufacturers would put into practice some of the ideas that co-operation suggests.

The gentleman hit the nail squarely on the head when he said that costs are receiving too little attention, especially the selling costs. Traveling expenses are always going up, owing to the ever-increasing cost of living. For the latter reason our office help expect more; all salaries are higher, in fact. This must be taken into account in sales-costs and most figures should be revised constantly so that an absolute basis is assured.

Considering another question, the "frivolous complaints" as to shortage and grade should be carefully investigated. The writer's concern adopts the following policy in all cases wherein either of the above instances the dispute is small. We compare the two tallies and if the difference is something like 300 feet, we enclose both tallies with a letter saying, "We do not claim that our inspectors are infallible

and there is always a chance for an error. At the same time there is the same chance on the part of your man. For this small difference it would cost us considerably more to investigate or send an inspector than the worth of the disputed stock. Now, you are fair-minded—don't you think the proper thing to do is to divide it up, each standing half?" Or in the case of a few hundred feet off grade the same strain could be applied—possibly mentioning the fact that (in the case of a shipment of No. 1 common) there might be a corresponding amount of higher grade in the ear that had simply been counted and inspected as the grade sold. In nearly every case we find that these small matters can be so adjusted. Of course, in the case of any particular customer, if these matters happened repeatedly, we would most assuredly make a thorough investigation, and if right make the customer see the point.

There are always ways of handling similar matters to advantage—a little thought and experience in close personal contact will soon tell you how to do it. You can never really get away from these small matters and it simply resolves itself into a matter of tactful handling.

Near the end of the talk referred to the gentleman says, "The more direct and intimate the contact between the producer and the consumer, the less there will be of sales costs in proportion." The writer begs to differ in that statement, and he does not look at it from the viewpoint of the lumber business alone. He has closely studied the methods of the largest concerns in other lines—those of national reputation—as well as to talk with their sales managers and cost experts. They are all agreed that the wholesalers are the factors of economic distribution. Nearly every article you can think of is handled through wholesalers, even though it is advertised by the manufacturer himself, and if space permitted the writer could show absolute proof of these statements.

Do you know that nearly every line of business has been through the mill-to-consumer idea and had to give it up because it is not equipped to do it? The men in general at the manufacturing end are not the right type of merchants; they may be efficient in manufacturing, but they hardly know the first principles of merchandising. The manufacturer-to-wholesaler-to-consumer trade channel is the only and proper one—first, because it makes each a specialist, and, second, because it is the most economic. The manufacturer spends his entire time reducing his costs and perfecting his manufacture—he has no sales worries. The wholesaler is then a sales specialist and has no manufacturing worries. Costs in both cases are lower. It has been proved so many times that it is hardly necessary to go into it again.

Traffic Matters Around Memphis

The railroads, as forecasted in the last issue of HARDWOOD RECORD, have voluntarily withdrawn the increased tariffs, affecting shipments of lumber and lumber products from milling points in the South to Canadian destinations, amounting to from two to six cents per hundred pounds. This advance was strenuously opposed by the Southern Hardwood Traffic Bureau, representing hardwood lumber interests of this city and section. Hardwood lumber interests from other southern centers also appeared at Cincinnati and St. Louis to give testimony calculated to bring about an order from the commission countermanding the advance. The railroad officials evidently came to the conclusion that the time was inopportune or that the lumbermen had made out entirely too strong a case against them. They have therefore voluntarily withdrawn the advance and have thus taken the matter out of the hands of the commission which had it under advisement. It was suggested a few days ago that the Southern Hardwood Traffic Bureau might insist upon a ruling from the commission in connection with the case, but it is now said that the action of the railroads ends the controversy.

Announcement has also been made that the western lines have cancelled the proposed increase in tariffs from points in Louisiana and Arkansas to Ohio and Mississippi river crossings. The ad-

vance was to have been about two cents per hundred pounds. A short time ago the western lines withdrew the proposed increases from points in the West to destinations in Kansas and Nebraska. This is only another way of saying that the railroads have voluntarily withdrawn increased tariffs in three distinct cases. In not a single instance have they been successful in getting an advance approved by the commission.

The withdrawal of the advance on the part of the western lines has resulted in a change in the schedule of the Interstate Commerce Commission. A hearing was to have been held at St. Louis, covering the proposed advance which has been withdrawn, but this has been changed from St. Louis to Memphis. The hearing at this point will be for the purpose of taking testimony in connection with the proposed increase in rates from Memphis and Mississippi points to New Orleans and it will be well attended by the officials of the Southern Hardwood Traffic Bureau and other prominent lumbermen of this city and section.

George D. Burgess, president, J. R. Walker, attorney, F. B. Robertson and other officials and members of the Southern Hardwood Traffic Bureau have just returned from New Orleans, where they went to attend the hearing before the Interstate Commerce Commission in connection with the through bill of lading contro-

versy. The Southern Hardwood Traffic Bureau had charge of the case of the Anderson-Tully Company, through which it was sought to secure an order from the commission compelling the railroads to issue through bills. Mr. Burgess said on his return to Memphis that the west side lines had already begun issuing through bills and that an agreement had been reached between these lines and the steamship companies providing that exports on through bills were to be exempt from demurrage and that deliveries from railroads to ship side were not to be delayed beyond a period of eleven days. Members of the export trade of New Orleans very vigorously attacked this agreement as between the steamship companies and the west side lines on the alleged

ground that it marked discrimination as between those who handle their exports into New Orleans on local bills and those who handle their export shipments on through bills. Mr. Burgess, however, believes that the agreement which has been effected between the steamship companies and the railroads will not be interfered with by the commission and that the outlook is very bright for a permanent victory in this controversy. Exporters here are very much pleased with the result of the agreement between the steamship companies and the railroads because they are of the opinion that it will make it possible to handle export shipments of lumber on a very much more satisfactory basis than during the past year and a half.

Ebonies of Commerce

Ebony is the trade name of a wood that is exceedingly hard, heavy and susceptible of a high polish. The true ebonies are obtained from several species of *Diospyros*, and are so deep black as to be used to personify blackness. The best known ebony is the calamander, or coromandel wood (*Diospyros quersita*) of Ceylon, and is much esteemed for ornamental cabinet work. It is a scarce and beautiful wood, exceedingly hard, fine, close-grained and heavy. This wood has a pale reddish or dark brown color, and is crossed by large pith rays, or isolated elongated patches of a deep rich brown color, passing into black. The luster is silky where the pith rays are small, but higher and more varying where the rays are larger and the grain coarser. Calamander wood is considered by many persons the handsomest and one of the most valuable of all the dark woods; the root has the most beautiful appearance. This wood is now getting scarce and the old carved ebony furniture from Ceylon is much admired and often sells for fabulous prices.

Belonging to the same genus as the calamander is the ebony of commerce (*Diospyros ebenum*), which, on account of its color and denseness, is so much used by turners, and for inlaying work by cabinet makers. This tree yields the best kind of ebony wood, but it varies in quality as it grows from sea level to the elevation of 5,000 feet in Ceylon. A number of other species of *Diospyros* are known to yield in great abundance the black ebony of commerce. Those of the East Indies are *Diospyros chloroxylon*, *D. cordifolia*, *D. mabola*, *D. melanoxylon*, *D. roylei*, and *D. tomentosa*. The ebony from the west coast of Africa is usually the most perfect black, that from Mauritius and Ceylon being variegated more or less with cream brown. *Diospyros cordifolia* yields a wood that is a dark brown, strong, durable, and is difficult to work. Ebony of a very superior quality is procurable in the western districts of the Madras presidency, as well as the northern Circars. Sixteen-inch planks of a fine uniform black have been obtained chiefly from Coorg and Canara. Smaller pieces are procured from Cuddapa, Salem, Nuggur, etc., but there is no steady demand, though it is a peculiarly fine timber for cabinet work, and some of it is well veined for ornamental purposes. Ebony may be obtained in Siam, but the quality is said to be not very good; small quantities are exported from there every year to China.

There are a number of entirely unrelated woods from widely separated parts of the world which pass under the general name of ebony. In addition to the 130 or more species of the genus *Diospyros*, which yield the hard, black woods, the genera *Brya*, *Dalbergia*, and *Maba* produce different kinds of ebony. The green ebony supposed to be furnished by *Brya ebenus* is obtained from Jamaica and other parts of the West Indies. The heartwood of this tree is dark green, and the sapwood is almost white. The wood is hard and susceptible of a very high polish. It is much used for rulers and other small work, also in parquetry. Another green ebony is said to be obtained from *Jacaranda mimosifolia* in Brazil. The name green ebony is also applied to the wood of *Excoecaria glandulosa* of Jamaica. Several species of *Dalbergia* yield what is known as blackwood or rosewood. One African species, *Dalbergia melanoxylon*, is used very extensively, and practically all so-called ebony from Africa is from this tree. It is found both in

East and West Africa. The ebony from Madagascar is doubtless of this species. Another tree which yields ebony is the ironwood (*Maba buxifolia*) of Ceylon. This is only a small tree, but its wood is valuable, being exceedingly hard and durable.

The bulk of the ebony used in Europe comes to Hamburg and Havre, which are very important centers for the ebony trade; the dealings in Havre are more considerable, perhaps, than those at Hamburg. The trade is largely supplied with wood from Madagascar, West Africa, Ceylon, Bombay and Macassar, and the importation in 1911 was as follows:

Madagascar	347.6 tons
West Africa.....	1,432.4 "
Ceylon and Bombay.....	53.4 "
Macassar	983.9 "

The prices of the West African kind ranked from \$1.10 to \$2.10 per 100 pounds; of Madagascar ebony from \$1.75 to \$3.90 per 100 pounds; and of Macassar ebony from \$1.50 to \$1.95 per 100 pounds.

The importation of ebony into the United States for the last five years was as follows:

Year	Value
1907.....	\$79,222
1908.....	98,832
1909.....	80,805
1910.....	92,777
1911.....	74,002

Metal Not Strong Enough in This Case

The contest between wood and metal goes on. It has been taken for granted by some persons that metal can be substituted for wood in most positions, and that the only thing to consider is cost. Experiments are showing the fallacy of this belief. There are many places where metal is an unsatisfactory substitute for wood, leaving out of consideration all regard for comparative cost. The plow beam is one such place. Formerly all were of wood, and by almost unanimous consent oak was used. Then iron and steel began to appear as substitutes, and for a time it seemed to be taken for granted that they were better, but trials in crucial tests failed to show it.

In a slow, steady pull where the ground is soft and free from obstructions, there may be little difference in service of a metal and of a wooden plow beam; but other conditions must be met. Rocks are struck and roots and stumps encountered, and it is in such cases that the wood beam proves its superiority. A cast iron beam is liable to snap short off if the plow strikes an unyielding object, while the steel beam under such circumstances is liable to bend and buckle and is thrown permanently out of shape. It is next to impossible, or at any rate it is expensive, to straighten a plow beam after it has been bent.

The elasticity of wooden beams permits them to yield under sudden strain and shock, and recover their original form almost instantly. Permanent distortion is so rare that it is practically unknown. A plow beam of wood may break but it rarely does so, and breaking is about the only mishap that can put it out of use. The lightness of wood is also of advantage.

One Source of Flagrant Waste

It is a well-known fact that the supply of good white oak is becoming decidedly restricted. This is reflected in the constant increase in prices. A prominent member of the Tight Barrel Stave Manufacturers' Association recently stated that "standing timber

WASTE IN CUTTING WHITE OAK STAVES, ARKANSAS.

has advanced at least fifty per cent in price within the last year, and when you find a virgin tract the advance is more than one hundred per cent. * * *

In addition to this we are compelled to go back fifteen or twenty miles from the railroad, and in some cases more, to get suitable timber for making staves, whereas a few years ago timber could be had eight or ten miles from shipping point, which makes our haul bill from fifty to seventy-five per cent more. * * *

Several years ago it was a common occurrence to work a tract of timber and get from fifty to sixty per cent prime staves. I venture to say at present the average of prime stock produced does not exceed twenty-five per cent."

With this decrease in the supply of available timber the necessity of better utilization becomes apparent if the industry is to be supplied. While the consumer may dislike the idea of paying higher prices for his supplies, nevertheless such increases are inevitable and are the natural outcome of the law of supply and demand. Everyone regrets to have timber wasted in any manner but not everyone is willing to pay the price which will make complete utilization possible. Not until the scarcity of timber reflected in high prices makes it absolutely necessary for every concern which operates to utilize completely all merchantable material, will lumbermen practice strict economy of the forest resources of their timberlands. The statement is proved by conditions in European countries today. Utilization is complete in those countries where prices are high, but where prices are low, as is the case in northern Norway, utilization is no closer than it is in the United States.

The amount of timber that has been left in the woods to rot because it would not pay to take it out is enormous. Most of this, however, was necessary waste. To have saved it would have involved a still greater loss in energy and capital. It has been, and still is to some extent, a common failing of many well-meaning but misinformed enthusiasts to denounce the lumberman for destroying the forest. Such persons do not realize that enormous waste would result if

timber were not cut. In a virgin forest growth is virtually at a standstill, for while individual trees are growing all the while, others are dying off just as fast. It is only by removal of some of the timber that growth of the remainder is possible. Before the advent of the lumberman the trees died from natural causes or were blown down or were killed by fire. The forests as a whole were rarely destroyed but only certain of the trees composing it. The lumberman has hastened the process of the removal of old timber and while his methods were wasteful they are usually less so than those of nature.

It is not sufficient that the owner of timber should be opposed to all waste, for if his lands are poorly situated as to market or topography or transportation facilities waste will result whether he lets his timber stand or cuts it. Good intentions alone will not prevent waste. No owner could be more anxious to secure complete utilization of every forest product than is the United States Forest Service and yet some of its timber sale areas reveal little if any better conditions than are to be found on neighboring private lands. There is usually this difference, however, that the government tries to leave the forest in the best possible condition for subsequent growth of timber. Until the price of timber exceeds the cost of growing, it is going to be difficult to get many private owners interested in forestry. That time is rapidly approaching, for our

virgin supply of timber is becoming decidedly restricted and as we must depend almost wholly on our own forest resources for the future supply it is very evident that timber values are bound to increase sufficiently to cover the cost of production. Nothing seems more certain.

The wastes referred to above have for the most part been unavoidable. There are other kinds of waste which can be avoided and that they are allowed to exist is an evidence of extravagance, inefficiency or carelessness. The stave manufacturer quoted above states further: "I do not think there is any line of business handled as carelessly as the

WHITE OAK WASTED IN THE MANUFACTURE OF SPLIT STAVES: IN THE OZARKS.

WASTE IN CUTTING WHITE OAK STAVES, ARKANSAS.

stave and cooperage business. We are very careful in selecting a tract of timber, and after agreeing on the price, we pay our good money for this timber. We then turn the valuable tract of timber over to a man or a crew of men to have it worked into staves and

bolts, and in nine cases out of ten, this is the last the purchaser ever sees of this timber, until it is delivered in his yard, either in staves or bolts. And what a pitiful sight to behold: bolts made of every conceivable shape; staves sawn too light, too short; thin edges and no proof on staves—this is what he actually sees. He does not know what has happened in the woods. He has not had time to go and see. He must buy another tract of timber and keep his mills running."

Here then is evidence of unnecessary waste. In dealing with a wood like white oak fit for staves there should be no excuse for bungling. Surely the wood has become scarce enough and the price high enough to put a premium on good workmanship. And how about the work in the woods? Perhaps if the purchaser of the timber would spend a little more time on the ground where his bolts or staves were being cut he could improve his material and effect sufficient economy to make it unnecessary to hustle after new tracts so strenuously.

One of the most promising methods of securing complete utilization is through a proper combination of different kinds of wood-using plants. Operators engaged in the manufacture of special products, such as cooerage stock, wagon material, handle wood, etc., take out only such material as is suitable for their individual uses and leave the unused portions of the trees to waste on the ground. Often not to exceed one-half of the merchantable material in the tree has been utilized. Other timber is injured by the felling of the particular trees desired. Stumps frequently are as high as three feet, or twice what is necessary.

The argument of the small specialty man is that in his locality only certain choice products can be taken at a profit. He contends that there is no demand for lower grade materials. The fact in the case is that it is not so much because there is no market for the other material as it is that the operator is not equipped to supply it. The small specialty men have little portable mills and operate as jobbers for the manufacturers who handle their products. These concerns afford financial backing and either give the jobber a contract to remove timber from company lands or assist him in securing stumpage here and there from settlers. The price he is to receive is fixed by the company and often he is under such financial obligations that independent action is prevented. He gets out only such material as the company desires and as this is usually limited to one or two choice products, excessive waste of merchantable timber results.

For instance one large cooerage concern in the Ozarks has about twenty-five small millmen jobbing for it for stave bolts alone. There is food for thought in the fact that the company does not let these jobbers work on its own lands but gives them contracts to cut outside stumpage it has secured. Comparison of the cutting areas left by the jobbers with those of the company's own men reveals the extent of the unnecessary waste. In the former case only half the commercial material in the tree has been taken, the remainder left in high stumps, top logs and somewhat defective portions which would not make prime staves but were capable of supplying material for other purposes.

This particular cooerage company logs its own timber and transports the logs from the cutting area to the mill by rail. There every log is converted into the particular products for which it is best suited. While cooerage is the principal product, the company finds it highly profitable to secure thorough utilization of its timber by producing lumber, ties, construction stock, hubs, felloes, chair and

furniture squares, insulator pins, etc., from material which is not suitable for cooerage.

This ability to secure complete utilization is not confined to the large mill. Small portable mills can be equipped at reasonable cost for working up all sorts of material. Instead of cutting the bolts all over the woods the logs are hauled to mill and such as will produce staves are so utilized without waste. If there is handle stock it can be separated, and so on for many things from the choicest to the most common. The man who says there is no market for the by-products is more often than not speaking without knowledge of actual conditions. The demand usually exists or can be created but it requires some business ability to take advantage of it.

Following are some examples of the grades and specifications of rough stock and squares for factory use in making special hardwood products:

Wagon axles: Squares from 2 $\frac{3}{4}$ " to 6" x 7" and 6 feet long.

Wagon bolsters: Squares from 3" x 4" to 4" x 6" and from 4' 1" to 4' 6" long.

Wagon reaches: Squares from 2" x 4" to 2 $\frac{1}{2}$ " x 5" and from 8' 10" to 14' long.

Wagon poles: Squares from 2 $\frac{1}{2}$ " x 4" tops and 4" x 4" butts to 3 $\frac{1}{4}$ " x 3 $\frac{1}{4}$ " tops and 3 $\frac{1}{4}$ " x 5" butts and 12 feet long.

Wagon eveners: Squares from 2" x 4" to 2 $\frac{1}{2}$ " x 5" and from 4' 2" to 4' 6".

Single trees: Squares for turning, 2 $\frac{1}{2}$ " x 3" x 36".

Neekyokes: Squares for turning, 4" x 4" and from 44" to 48" long.

Wagon felloes: Squares for sawing, short clear cuttings 10" to 14" wide and from 24" to 30" long.

Hub stock: Blocks in the round for turning, from 9 $\frac{1}{2}$ " to 12" in diameter inside bark and from 12" to 15 $\frac{1}{2}$ " long.

Spokes: Squares for turning, 2" x 2 $\frac{1}{2}$ " x 30".

Implement stock: Factory stock, board and planks for cutting, to grade No. 1 common and better.

Handle stock: Bolts 40" long, split or in the round.

In addition there is usually a market for railroad ties, fence posts, piling, poles and occasionally for cordwood. That it pays to manufacture diversified products rather than a specialty alone is proved by the fact that it is being done and in places, too, where the single specialty man says it can't be done. It means getting out of the old rut and that for some is impossible; it also means getting a price for the special stock commensurate with its intrinsic value.

Woods for Shuttles

A recent consular report from Bradford, England, gives figures on dogwood and persimmon used in that country for shuttles. These woods are cut wholly in the United States. England dogwood is known as cornel. The shuttle manufacturers purchase their supplies of wood from wholesale merchants at Liverpool, either in the form of logs or, more generally, in blocks, packed in bags, cut to sizes ready for working up. The dogwood logs vary from 4 $\frac{1}{2}$ to 6 inches in diameter and 4 feet 4 inches to 6 feet in length; the persimmon logs vary from 6 to 20 inches in diameter and 6 to 10 feet in length. These are sold by the ton (2,240 pounds) at prices that range from \$15.82 to \$19.47, depending on quality and the state of the market.

The dogwood blocks cut to sizes are said to be selling at the following prices: Width, 1 $\frac{5}{8}$ —1 $\frac{3}{4}$ inches; depth, 1 $\frac{3}{8}$ inches; length, 12—13 inches; price, \$6.57 to \$9.73. There are said to be three qualities.

One firm states that \$19.47 is the highest price it has hitherto paid for persimmon blocks. Quotations follow: 2 by 1 $\frac{1}{2}$ by 14 inches, \$6.08 to \$7.30; 2 $\frac{1}{2}$ by 2 by 18 inches, \$17.52. A ton is equal to about half a cord.

Some of the English shuttle makers use African boxwood. Formerly most shuttles were made of Turkish boxwood, which is now too expensive for that use.

Circassian Walnut

The Forest Service has published circular 212 on Circassian walnut (*Juglans regia*). It was prepared by George B. Sudworth and Clayton D. Mell, and is replete with information for those who buy, sell, or use this wood. Many persons have experienced difficulty in their attempt to secure statistics on the quantity used, the sources of supply, and the cost of placing it on the market. Several other matters concerning this interesting wood have been little understood, and confusion and misunderstanding have resulted. The circular just issued will clear up many of these points, and will prove interesting to the general public.

One thing which will surprise most people is that Circassian walnut now grows entirely round the world in the north temperate zone, following the region of mild climate from northern China across Asia, Europe, and the United States, to California. In most parts of this belt which encircles the globe it is a planted tree. It is not known just how large its original range was; but apparently it included the region near the southern shore of the Caspian and Black seas, and it is not improbable that it spread from that country both east and west by means of planting. It reached Europe a long time before the Christian era, and it now grows in most of the southern and western countries of that continent. The different names by which the tree is known include English walnut, French walnut, Italian walnut, and Austrian walnut. It is the tree which produces the English walnuts and the Manchurian walnuts of commerce. It has been extensively planted in California and grows well in the southern states, bearing nuts abundantly as far north as Washington, D. C.

It is the wood and not the nuts that interests lumbermen. Planted trees have never developed wood with the beautiful figure obtained from that which grows wild on the rugged mountains south of the Caspian and Black seas. Some excellent material comes from the region northwest of the Himalaya mountains in India where it is not improbable the tree grows naturally. At any rate, specimens nine feet in diameter and over one hundred feet high have been reported in that region, and pure forests of considerable extent occur. That timber is now a long distance from market.

Circassian walnut is bought by the pound at shipping ports. The weighing is done while the logs are in the rough, with the bark on, and of course the sapwood is weighed also, though it is useless to the purchaser. The sap is from four to six inches thick, and the purchaser of the logs removes it and ships the heart only. He thus leaves behind as useless about half the wood he buys at four cents a pound equivalent to about \$200 a thousand feet board measure. It can be readily understood that the chips in a Circassian walnut shipping yard constitute a very costly waste heap.

After the purchaser has bought the logs and prepared them for shipment, he must pay—if in Russia—an export duty of \$20 a ton to the government. Next comes the freight charges on the long haul to market. If the wood is for the United States where most of it finds market, it must be shipped from 6,000 to 9,000 miles before it reaches the factory where it is converted into veneer or other products. It is believed that about 2,500,000 feet, log measure, of Circassian walnut reaches the United States yearly.

The cost of cutting the logs and delivering them at the seaports or other points of shipment is high. They are hauled long distances over poor roads. The green wood is too heavy to float, and log drives of this walnut are unknown. So excessive is the labor which is necessary in transporting the timber from the mountain fastnesses to shipping points, that those who sell the logs at the high price of four cents a pound make little more than living wages.

No other timber tree has been exploited more than Circassian walnut, and the demand for it has always been greater than the available supply. Much of the Circassian walnut now used in various parts of the world comes from the shores of the Black sea, and from other regions as far as Persia. The greatest outlet of southern Russia is probably from Odessa. None of the wood grown in western Europe is shipped to this country. That grown in England is

not equal in quality to the wood from the Caucasus, though it is much sought after for furniture, and particularly for gunstocks. In fact, the demand for these purposes in western Europe is so great that the domestic supply invariably fails to meet it, and at times there has been great dearth of the wood there. Realizing the importance of a home supply, France passed an act in 1720 prohibiting the exportation of Circassian walnut. The shortage of supply in Europe has been due chiefly to the enormous demand for gunstocks in times of war. The wood of approximately 12,000 trees was required early in the nineteenth century for this purpose alone. In consequence, large numbers of plantations were established throughout England, France, and Germany. Some of these were very extensive; one founded in 1818 near Boulogne, France, contained about 30,000 trees.

Widespread consumption of Circassian walnut for gunstocks and furniture continued in Europe until its cost became very high and importation began from the Orient. Liverpool and London were then, and still are, the chief ports of entry from which Circassian walnut is reshipped to continental Europe and to some extent to the United States.

Profit from growing Circassian walnut in Europe for timber is much less than it once was, both because large quantities (about 20,000,000 feet) of our native black walnut are annually shipped there, and because the wood is now coming from the East.

Dry Circassian walnut weighs about forty-five pounds per cubic foot, is hard, compact, easy to work and split, moderately tough, and durable in contact with the soil. It shrinks very little in seasoning and does not crack or warp. The heartwood is dark chocolate brown, often shading from light brown to black. Barked and other highly figured forms of the wood take a beautiful finish. Radial (edge-grain) and tangential (bastard) cut boards are always lighter in tone than transverse sections. In light-colored sticks the annual rings of growth are clearly but not strikingly defined, but in dark specimens are very indistinct. The pores are irregularly scattered.

The wood of trees grown in poor upland and hilly soils has a beautiful fine grain and texture, while the wood grown in rich lowland soils is much coarser and less beautifully marked. The best qualities of timber are obtained from vigorous sound trees over one hundred years old, which rarely have a clear length of more than twelve feet. The most beautifully veined wood is in the roots and burls, the latter being particularly common on trees near the Black sea. The grain in such growths is so interwoven and twisted as to produce the most curious and irregular figures, giving the wood an unequalled value for veneer. A single tree of fine figure sometimes sells for several thousand dollars. Expert agents who are employed by large dealers in this wood are constantly in the principal markets on the lookout for exceptionally fine logs, and when one is discovered it is purchased without much regard for the price asked for it.

Various woods are sold as substitutes or imitations of Circassian walnut. Although it is usually easy for expert buyers to recognize true Circassian walnut in the logs, it is often difficult to distinguish the wood from some of its substitutes when these have been skillfully stained and finished. There are many good African, Asian, and South American woods which are similar in structural qualities to Circassian walnut, though none possesses the magnificent figure, delicate tones, and velvety texture of the walnut. Chief among the woods which resemble Circassian walnut in general appearance is the so-called satin walnut, tassel wood, hazel pine, or red gum (*Liquidambar styraciflua*) of the United States, the wood of which has been sold as Circassian walnut both for furniture and for interior finish. The wood from butt logs of red gum is often handsomely veined and mottled, and is strikingly similar in general appearance to Circassian walnut. Butternut is so similar in color and grain to Circassian walnut that it could be substituted for the less handsomely figured wood of the latter. The light and dark browns, and the black veining of the Oriental wood, however, readily distinguish it from the solid brown shade of butternut.

Annual National Wholesalers

That sterling and foremost lumber organization, the National Wholesale Lumber Dealers' Association, held its twenty-first annual meeting at the Hotel Chelsea, Atlantic City, on Thursday and Friday, March 6 and 7.

There was only a moderate attendance at the first session, but this gradually grew as the various meetings progressed, until at the final meeting, on Friday afternoon, there was the usual representative gathering. This meeting, of course, was made up largely of eastern manufacturers and wholesalers, but there was a considerable sprinkling present of allies of the organization from the South and Middle West.

The address of welcome was made by the Hon. William Riddle, mayor of Atlantic City, who addressed the meeting on the subject of "Commission Government," in which he ably contrasted the advantages of this municipal government with that of the old council and department system.

N. H. Walcott of Providence on behalf of the association made a suitable response to the mayor's address.

On motion, the reading of the minutes of the last meeting and the roster of members was omitted.

President Parker delivered his annual address as follows:

Address of President

The National Wholesale Lumber Dealers' Association, now assembled in its twenty-first annual meeting, has had an honorable career. Founded in New York City in 1894 by a handful of eastern and Michigan lumbermen, it has continued to grow and prosper until its membership now numbers over four hundred, distributed among thirty states and Canada, and its influence is widespread in the whole range of the lumber trade from manufacturer to retailer.

It was in a spirit of bettering the conditions existing in the lumber trade that the fifteen men met and incorporated under the name now recognized as one of the leading trade associations of this country. Consider the object of the association as defined in its charter—"To protect members against unbusinesslike methods in the wholesale and retail lumber trade; to foster such trade and commerce; to reform abuses in such trade or business; and to secure freedom from unjust or unlawful exactions; to diffuse accurate information among its members as to the standing of merchants and others by and with whom such trade or business is conducted; to produce uniformity and certainty in the customs and usages of said trade and of those engaged therein; to settle differences between its members, and to promote a larger and more friendly intercourse between them." I submit that the National Wholesale Lumber Dealers' Association has fully lived up to its purposes as defined in its charter, and is entitled to the support of every wholesale lumberman.

The past year has been an active one in most departments of association work, and I believe the organization machinery was never in

better shape to produce results for our members than at the present time. The good judgment and painstaking efforts of our efficient secretary, aided by his able corps of assistants, has brought the organization to a high degree of efficiency which has been reflected by the unusual harmonious relations which have existed between this association and all branches of the lumber trade during the past year; and in the many matters which have been presented and passed upon, this association has displayed a spirit of fairness and good judgment which has given it a high standing with other associations and individuals with whom it has come in contact. Our relations with the several lumber manufacturing and retail associations were never more harmonious, and much good has resulted to the lumber trade from the combined efforts of our association acting with other lumber trade associations to correct abuses in several matters affecting the lumber trade.

Our retail friends have felt, I believe, that they have had our support in their efforts to keep the lumber business in proper channels, as all lumbermen recognize that any change in policy which would disturb the relations between manufacturer, wholesaler, retailer and consumer would bring about chaotic conditions which could not but affect seriously all branches of the lumber business, and bring a detriment to all and a benefit to none.

The first and most important work of the association has always been and is now, in my opinion, the work covered by the bureau of information and legal department, and while I will leave to the chairman of the bureau and the manager of the legal department to give a detailed report of the work which this department is doing for our members, I feel it is my privilege to point out to all of our members the great value of these departments.

The bureau of information, or credit department, is splendidly equipped to give accurate information regarding the financial standing and business methods of wholesale and retail lumber buyers, such as can be obtained from no other source. Over thirty-two thousand lumber buyers are rated by this department, and up-to-date reports can be promptly obtained upon request by mail or telegraph, giving the financial responsibility, moral business risk and business methods of any of these buyers. No mercantile agency can furnish the valuable information that the bureau is able to give, and no member can afford to be without these reports.

I wish to compliment the chairman of the bureau of information and its department manager, for having brought the bureau up to a still higher grade of efficiency this year by their careful and painstaking work; and if the association had no other asset than its bureau of information, this alone would remain a monument to the usefulness and good results of our association work. Having served for several years myself as chairman of the bureau of information, and having been instrumental in the starting of the legal department, and knowing what these departments are doing for our members and the lumber trade as a whole, you will pardon me if I indulge in a superlative when calling to your attention the splendid work being done and the results accomplished by these departments.

Our chairman advises that he is at present getting up a blue book of good words from our members who are using the bureau, and I earnestly

E. F. PERRY, NEW YORK, N. Y.,
SECRETARY.

F. R. BABCOCK, PITTSBURGH, PA.,
TRUSTEE.

R. M. CARRIER, SARDIS, MISS.,
TRUSTEE.

ask any of our members who are not members of the bureau to secure a copy of this blue book and give its contents careful consideration.

The legal department in connection with the bureau of information had made rapid strides since it was established in 1904. The important work of the legal department is the collection of claims, and I submit to you figures from its records, showing a steady growth. Claims to the amount of \$1,434,727.00 were placed with the department from Jan. 1, 1905, to Dec. 31, 1911, and of this amount \$1,217,344.00 were settled, and I venture the statement that this is a much larger percentage of claims settled, and at a much lower cost than can be shown by any commercial agency. I ask the heartiest support from all our members to the bureau of information and legal department. They alone are worth many times the expense of both association and bureau dues, and their usefulness merits a continued growth and increased patronage.

The railroad and transportation committee, through its bureau, has done good work for our members during the past year. Information and assistance covering a wide range of transportation matters has been furnished members, and many claims for loss and damage in transit, overcharge in weight, rate, misrouting, etc., have been handled, for which a nominal charge has been made based on the actual amount collected. Many of our members fail to appreciate the effective work done by the railroad and transportation bureau. In obtaining free allowance in weight for stakes used on flat and gondola cars, this association, through its railroad and transportation bureau, has benefited the whole lumber trade in saving it many thousands of dollars; and the bureau is in a position to compel the railroads not now making this allowance to do so. I ask your careful attention to the detailed report of the chairman and traffic manager of the railroad and transportation bureau, noting especially its efforts in connection with the National Lumber Manufacturers' Association to obtain a correction of the abuses in the weighing of shipments of lumber.

The legislation committee has had but few important matters submitted during the past year, but this committee is always on the alert to look after the interests of the lumber trade in protecting it from unjust and burdensome legislation which is continually cropping out in national and state legislatures; and our members are urged to report to this committee any proposed laws affecting unfavorably the lumber trade.

The marine and coastwise insurance committee, working in the interests of members using water transportation, has been little called on during the past year, but I venture the hope that during some coming year plans for an interinsurance arrangement such as is being successfully and profitably carried on in several local associations may be attempted by the marine and coastwise insurance committee, thus guarding the interests of our members from excessive rates from the marine insurance companies.

The fire insurance committee, under the able chairmanship of Geo. H. Holt, has been active during the past year in protecting the interests of our members in securing lower insurance rates than offered by the board companies. Great credit is due to Mr. Holt and this committee for the campaign of education that has been started among our members; and material results are already appearing in the more liberal treatment of the lumber insuring interests by the insurance companies. Mr. Holt has some broad-gauged ideas on insurance matters, which will be presented at this meeting, and I ask your careful attention to his report and suggestions.

This committee, in connection with the special committee on single standard universal hardwood inspection, has been acting under a resolution adopted at a former annual convention, with a view of using its good offices to obtain a national set of rules governing the grading and inspection of hardwood lumber; and while their efforts have not yet met

with full success in bringing about the desired situation, some good has resulted, and very cordial relations have been established between our association and the hardwood lumber associations.

To settle business differences between our members is the work of this committee, and I am pleased to report that the arbitration committee advises that business between our members during the past year has been conducted with such "smoothness and harmony" that it has been unnecessary to call for the services of the committee frequently. The committee was called upon to arbitrate one case, which was promptly decided. Several minor cases were submitted to our secretary and were settled on his suggestion without aid of the arbitration committee. This committee offers another source of saving of time and expense to those who accept its good offices, by settling disputes between members at actual cost of the expense of the committee, and a saving of your own time and the annoyance of courts and juries.

We are much indebted to this committee and its efficient chairman for its excellent work during the past year. The forestry question has been growing in the public mind and is now one of the active questions of the day. The people of this country, with its tremendous resources of timber, must be educated to take all precautions to avoid a future timber famine, by advocating such legislation as will tend to preserve the forests from needless waste and destruction, and by advocating a proper and scientific plan of reforestation which will preserve the forests for those who will come after us. Our committee on forestry strongly advocates a liberal governmental appropriation for the protection of the national forests, and a rigorous protest against turning over the national forests to the states in which they are located, and asks the active co-operation of our membership in aiding it in these reforms.

This important committee, under its able chairman, F. S. Underhill, has been endeavoring to bring about a better condition of affairs in the interest of the wholesaler on the subject of terms of sale, realizing that it is the wholesaler rather than the manufacturer who suffers from violations of discount privileges, and believing it is in the province and right of the wholesaler to remedy this evil to a considerable extent by taking a firm but courteous stand with his customers whenever there is a violation of the terms of sale, which are as much a part of the contract as the price. The committee on terms of sale and trade ethics brings in a strong report this year, which merits your most careful attention, and which I hope will result in bringing up for general discussion in the meeting this very important subject.

Several other committees not mentioned above will have interesting reports to submit at this meeting, to which I ask your careful attention and consideration; and I take this opportunity to express my thanks and appreciation to the chairman and members of each of the several committees for the time and thought they have given these association matters during the previous year.

I wish also at this time to welcome the delegates and representatives of the different associations who have gathered here with us, and I hope they will feel free to attend our meetings and to express themselves on any subjects brought up for discussion.

It is my sad duty at this time to call your attention to the recent death of one of our board of trustees, L. R. Vandervoort of North Tonawanda, whose loss we shall all keenly feel; and I shall later have this association, through its board of trustees, pass suitable resolutions of condolence.

Our membership during the past year has suffered some losses on account of business failures and concerns going out of business, but through the efforts of our special membership committee, and the faithful efforts of several members of our board of trustees, we have made an

aggressive campaign and today find our membership approximately the same as a year ago. This question of increasing the membership leads me to call to your attention the need for our association covering a much broader field than formerly, if it is to continue to grow and prosper in the future as in the past. If our association is to be national in character as well as in name it must recognize the changed conditions in the lumber business since the time of its inception. We must recognize that the great lumber interests of the country are now located south of the Mason and Dixon line, and west of the Missouri river, and it is these localities that need our good services as much as our eastern members. The opening of the Panama canal this year will bring the Pacific coast lumbermen into much closer touch with the eastern wholesale lumber trade, and as my worthy predecessor wisely pointed out in his address at Louisville a year ago, it is necessary for us to turn our thought toward the great Pacific coast in order that the great lumber industry in that immense territory may be familiar with the many benefits to be derived by affiliation with us. I re-echo these thoughts to you this year, and ask your careful consideration as to whether it would not be wisdom on our part to consider holding one of our future conventions in that far distant land.

Our executive committee meetings and also our board of trustees meetings during the past year have been well attended, and I desire at this time to personally thank both the executive committee and the board of trustees for the loyal support they have given me, and also the chairman and members of the various committees, who have promptly disposed of what business has been referred to them, in a most satisfactory and businesslike manner.

In laying down my mantle this year I feel under obligations to each and every one of you, and I wish to thank our members and friends who have helped in the arrangements and details of this annual meeting, thus making my burdens lighter than I could have asked.

In conclusion I feel that it is a great honor and a great pleasure to have served as the executive head of this association, and after being closely associated in various capacities with its workings for a period of over fifteen years, I feel that I am putting it none too strongly when I say that the efforts of this association have always been to make the lumber industry better, cleaner and more harmonious, and I believe the whole lumber trade is today better for the work this association has done.

Every member within our ranks appreciates the truth of this statement, but there are many outside of our ranks who, while participating in the indirect benefits this association brings, are not bearing their share of the burden; and I appeal to every loyal member of our association to use his best efforts to bring these outsiders into our body; and if this could be brought about our membership could be easily doubled, and the power of the association for doing good for the lumber trade could be trebled. Is it not worth the effort considering the possibilities of the future from what the association has done in the past?

The annual address of Secretary E. F. Perry then followed.

Secretary's Report

This being the twenty-first annual meeting it may be said that the association is of age, and, if a man, entitled to speak for itself, but being only a corporation its annual report or statement must be made by someone else, and not only to record its past but to make clear the present and grease the ways for the future. My report will not be statistical but will be more a memorandum of the year's work plus some comment on our methods, also a suggestion for the future.

The details of the association work the past year have been very little different from those of years gone before. The general scope and character of the work remains substantially the same even though methods of merchandising and distributing lumber have changed very materially since we first started, twenty odd years ago. The change, however, has been gradual, and we believe we have kept pace with these changes. The work, however, so overlaps each year that it is difficult to find a common starting point.

You have undoubtedly noticed that our committees also are usually partly made up of members who have been prominent workers, and who have by their long connection become proficient in the work of the association, thereby giving their committee work the benefit of an accumulated practical experience. It has often been remarked that we have been fortunate in having such a large portion of our members continue interested each year, thereby enabling us to find so many efficient men to make up our working committees, a help which is greatly needed in an expanding organization and business. We lumbermen are finding a wider source of supply and a broader distributing field, requiring the greatest possible co-operation to keep pace and informed. It is a common occurrence these days to find New York, Philadelphia, Baltimore, Cincinnati and Boston and southern city members selling lumber manufactured in the extreme West or South to be shipped to Canada, Chicago, Buffalo, Albany—twenty-five years ago recognized as the lumber centers. Twenty years ago Canada was a great lumber-producing country and is to-day, but our southern members also find Canada a big buyer of American lumber. (In 1912, 519,781,000 ft., value \$11,831,115.) The fact is that there is no longer any section known primarily as a lumber section—Canada and the United States are all one great lumber producing and lumber consuming market. Nova Scotia sends spruce to St. Louis; Tacoma sends spruce to Pennsylvania; Georgia sends yellow pine to Ottawa; Memphis sends oak

to California and Montreal—all of this within the last decade.

Our association comes in vital contact with every phase of the lumber business as a merchandising proposition, and while defined more particularly as a wholesale association, and while our direct interests are with the wholesaling of lumber, it remains true that every wholesaler is, in proportion to his necessity to distribute his lumber, particularly interested in what this organization does or may do to minimize waste or cost in such distribution.

All business quickly finds the line of least resistance, and our efforts to better conditions and conserve to our members and the people at large the best possible methods of delivering to the ultimate consumer our product, is the underlying principle of this great association work.

W. H. Hotchkiss of New York state sends a warning when he says he "believes that the businesses to feel the change first would be those in which the waste was greatest, and all who stand between the producing farmer and the shopworker and the ultimate consumer would be subject to the pressure of elimination." If this is true it emphasizes the necessity of our using our best efforts to study the theories and practices of distributing lumber from the sawmill man who is in the position of a farmer to the ultimate consumer. We all know that it would be impracticable to make these studies individually, therefore it seems to me that they must be done by the greatest possible co-operation and by concerted action through those associations which have been organized primarily for this purpose.

Those of you who have served on our board of trustees, standing or special committees, and have kept in touch with what we have been doing will testify that only the best motive has been our aim. I have never, in all my connection with the association, heard any small or mean proposition presented; in fact, we always have considered all matters in the light of not as to how our own members may benefit to the exclusion of others, but what is the best action for the good of all the trade in the broadest possible method.

While in the past couple of years the lumber business has been much maligned by some hidden force and often classed with the "trust" idea, this has all been so vague, and so much unfounded in fact, that there is sure to be in time a good healthy reaction, and we will find less talk of necessity of law and more of the spirit of fair business dealing. And right here it will interest you to know that with the single exception of our initial corporation needs this association has never had or needed the advice of a lawyer to tell us how to act. No organization of my knowledge has adhered to its first principles as persistently as has ours, and when we consider the diversified interests of our large membership, this means much.

I do not wish to moralize too much. It might be unseemly, and I may infringe on some of the reports of our committee chairmen, but I believe I am justified in calling particular attention to two or three of the special matters which have been in the past, and still are, the fundamental parts of this body. I refer to the bureau of information or credit department, the trade relations, the terms of sale, arbitration, etc.

Much has been said in recent years about conservation. I believe we have done as much for the principles of general conservation as any other voluntary commercial organization in this country.

We, however, are weak at one very important practice, and that is in our extension of credits. Some of us close our eyes to experiences of others and try to win out by taking our credit insurance, but, gentlemen, we can never win out by this subterfuge, as the failures of hundreds of unsuccessful merchants prove, and while a few seem to have profited by this plan it is a false economy. We must in the future give more concerted study and support to putting our credit system on a proper basis. Entirely too much money has been lost, almost foolishly, during the past few years in bad debts. Credit all along is too cheap, and while we observe a greater interest in this subject it is getting to mean much to your success in business. Possibly the excessive losses of lumbermen in the past couple of years may not have attracted your attention. They have, nevertheless, been heavy. The banking interests have not failed to notice it. We must save at this end if we would lower the cost of doing business, and too much of our time and energy is wasted through failures of those with whom we do business, and who are not entitled to the credit and confidence we extend them. We must learn that extending credit is equal to loaning money, and every sale should be made secure for a proper return to you of your principal plus your legitimate trade profit.

Our bureau of information is well equipped to disseminate the information which comes to it from you, and if you keep us informed we will do our part to give out this information in the most practical form possible, and with this knowledge properly before you, and proper methods on your part, a great waste may be stopped.

Recent government suits against retail associations have been misunderstood by many, and the principles of right trade relations should be given careful consideration. Careful study has been given these phases of business, and probably we may find it desirable to make this subject a basis of future careful study by our committees. So much depends upon a solution of this problem, as it relates to credit, economy and fair trading, that we cannot afford to overlook it, and the rule of reason as laid down by the Supreme court of the United States applies to the lumber business, as it applies to every other branch of trade.

Linked with all this is the terms of sale basis upon which we transact our business, unstable, irregular, discriminating, unsatisfactory to nearly everybody, buyer or seller, and which, considering the vast correspondence during the past six months, will be freely discussed at this meeting, and which will, if once settled satisfactorily, relieve our bureau of information, collection department and our committee on arbitration from much disagreeable work.

I had intended to say a further word regarding arbitration between members, but our committee report covers it all and makes some suggestions. It seems strange that it is so difficult to find a common plan for handling disputes between members, but I suppose that if it were easy there would also be no cause for arbitration.

Our association is entitled to a further word because of its standing and real worth as a national factor. Mr. Taft, while President, in an address given a couple of months ago, among other things said substantially:

"You will have to have a school from which the new chambers of commerce can draw their secretaries, who will train the new membership in the way in which the organization can be built up, and give them a practical knowledge of how they can do what they are organized to do."

Mr. Taft, seeing the great influence of local organizations all over the country undirected as to common purpose, suggested the organization of the Chamber of Commerce of the United States of America. Now, if it is true and is being recognized that these various organizations can do a greater good with trained secretaries, our lumber associations are to be congratulated on being well in the forefront, for it is conceded that as a class lumber organizations have had the benefit of trained secretaries almost from the first, their only weak point being that neither the association nor their secretaries have profited to the full extent of their opportunities. A school or congress of lumber secretaries and chief executive officers can undoubtedly increase the efficiency of our lumber organizations, and probably we have not been able to do as well as we could because of overlapping of efforts and a waste of time, and a greater exchange of information between sections and interests will be a source of great help. Railroads, for example, need our co-operation as well as our restraint. Information properly distributed will help to present our grievances or needs fairly as would the same principle apply to many things.

We have always very wisely steered clear of any price-making schemes or any schemes which may be construed as in any way interfering with the free course of trade in any form. Several of our associations have been organized with one definite object, thus making them specializing organizations. Our own association and some others have co-operated with these just so long as we have been able to see that they were organized on broad principles and for the general good.

The government's attitude in some of the recent suits has unquestionably enlightened us as to what may be done through properly organized associations such as ours. It is my opinion that under these enlightened conditions we will find membership in our association being eagerly sought by those who are entitled to membership therein, and it is my prediction that during the next couple of years our own association will find coming into its ranks a large number of individuals and firms who desire the information and chance for co-operative help which is herewith afforded.

Our offices at 66 Broadway, New York, are constantly being enlarged; our office force is constantly being added to, and the expense of handling our business is constantly increasing. Part of this is met by an increase of membership and part of it is also met by a greater efficiency through the accumulation of material and experience.

You will notice by the reports of our committees that there has been an increased work carried on by them for the association during the past year, and while our membership has not increased in numbers it is fair to state, and without casting any insinuations, that the general character of our association membership has greatly improved by accessions during this term. We have been accused of being too anxious to add to our members, and possibly the claims which have been made by some of our members that membership should be sought rather than coaxed is the proper method for us to pursue.

We have had the usual regular trustees' meetings as provided for, also the several meetings of the executive committee and various other committees as needs demanded. As secretary of the association, I have traveled thousands of miles in the interests of the association work; have attended the conventions of other lumber associations, as well as conventions of various other civic organizations in which we found we had a common interest.

Our railroad and transportation department has kept good pace with the ever-changing positions of the Interstate Commerce Commission and the various other state railroad commissions, all of which will be covered by reports read to you later in this convention.

I wish to again further urge that this association use its best influence to bring about a better understanding as to what is known as regular uniform terms of sale, so that there may be a greater freedom of competition and less discrimination in the matter of making contracts. It is very generally believed, and our experience leads us to acquiesce in this belief, that a uniform term of sale of lumber will work out to the benefit of the

entire lumber trade—consumer as well as retailer, wholesaler or manufacturer. We make our contracts read "regular terms," and fifty per cent of our settlements are unsatisfactory or disputed because no one knows what "regular terms" means. I believe if we can arrive at a point where a definite uniform term of sale may be adopted that there will be a great conserving of mutual as well as financial loss.

I wish also to emphasize and ask your support for the bureau of information in its effort to make it a uniform practice that financial statements shall be made before credit is granted, which practice would, if universal, eventually in a great degree eliminate the dishonest merchant not entitled to credit, as fifty failures during the past year have proven.

I am pleased indeed to report the association to be, in my opinion, in a strong and flourishing condition, as well equipped to perform its work as at any time in its history. This, of course, because of our accumulation of experience, effort and history, should be expected.

The members of the association are entitled to a great deal of credit for the unselfish manner in which they have again this year responded to the call whenever occasion required.

From correspondence received I believe this meeting will be one of the most profitable of any we have had, and the basis will be laid here for a very prosperous coming year. I wish to thank the members of the association for personal favors and support.

W. W. Schupner, department manager of the bureau of information, told of the workings of that bureau. He said that the demand upon the bureau last year was greater than at any other time, which was shown by records as well as by the voluminous files of correspondence with the subscribers. The report said that during the past year it has been more necessary to follow information closely, and revise and re-revise reports than ever. Every possible influence has been brought to bear upon the work. Daily conferences were held for the purpose of obtaining more detailed facts concerning financial statements.

The confidence reposed in the bureau by the trade continues to grow, and voluntary statements are becoming more frequent. This confidence has been very helpful during the last year in bringing about a better condition of affairs.

Failures last year required considerable attention, not only as regards the payment of accounts but in following up possible after-effects. Lists of creditors have had to be carefully scrutinized with a view of ascertaining if some individual creditor was in a position to stand the probable loss. This, according to the report, necessitated some pretty pointed interviews in correspondence, but no hesitation was felt in going after facts which were pertinent and absolutely necessary for complete and comprehensive reports.

The question of signed financial statements occupied a great share of the bureau's attention, and the increased satisfactory replies are most encouraging. The new concerns have usually been most prompt in signing such statements, but a considerable sentiment is felt on the part of the older concerns against complying with this request. A signed financial statement as a basis on which to secure credit is becoming an instrument which can not be treated lightly, according to the report, because some states have passed laws which make it a misdemeanor to seek credit by a written statement known to be untruthful. The federal government also has a section in the penal code which imposes penalties in this respect.

Relating of actual experience by members is a valuable feature of the bureau's report, and their effectiveness can not be doubted. Several hundred written opinions are received at the office each day, which gives an idea of the extent of the co-operation.

The system of investigating through local attorneys and similar services has been very successful. Frequent interviews are had with the bank credit men resulting in an accumulation of facts, which find their way into the reports. Some of these interviews and special correspondence from members last year revealed the report current among banking circles that because of the experiences of certain banks in becoming creditors in some large lumber failures, some discredit is caused to the lumber trade and commercial lumber paper is sometimes regarded skeptically. This matter was immediately investigated by Mr. Perry, who attended a conference of banking houses, where the character of failures in question was discussed, and the unjust and erroneous impression at least overcome.

The report stated that 2,000 complete reports, making a total now of 32,000, were added last year to the bureau's fund of information, and each year's increase means considerably more work than that of the previous year.

The report of the collection department showed a balance on hand of claims, March 1, 1912, \$260,972, of which \$134,433 is in the hands of association attorneys throughout the country and Canada, leaving \$126,539 representing claims in the course of collection through the association office. Net fees last year were \$4,800. These figures reveal a greater prestige accruing to the association through handling the larger number of claims, and also result in a corresponding increase in information for credit files. The average fee for this work has been slight.

The very prestige of the association has in a great many cases helped materially in collecting bad accounts, and when attorneys are necessary the best only are used. In fact, the association work is largely sought by leading attorneys who desire the prestige of having it known that they represent the National Wholesale Lumber Dealers' Association.

In certain instances where certain failures indicated that they would carry others in their wake, the association immediately got in touch with those likely to be involved, and assisted in plans that met with the approval of the creditors and avoided failures.

The report then told of the credit report system and the successful work of collections. In short, it indicated that the collection and information department is in the best form it ever enjoyed and is constantly proving of more benefit to the trade in every way.

The arbitration committee report was then given, through Edward Eiler, chairman. During the past year there was only one case of dispute between members of the association which reached the arbitration committee. The case was promptly decided by the unanimous vote of the three members who considered the evidence. One of the members in this case was not pleased with the decision of the arbitration committee. The report stated that decisions have in some instances resulted in the withdrawal of memberships.

The report said that the suggestion made in December, 1912, along this line resulted in the appointment of a committee by the board of trustees to investigate the present arbitration system. This is now in the hands of this special committee.

William E. Litchfield then reported for the trade relations committee. This committee has had nothing brought to its attention during the year. Harmonious relations exist between the National and other associations. The report said that wholesalers in many parts of the country have in the past and up to the present stored stocks in large yards, taking the stock acquired from the smaller mills and furnishing them with immediate capital. Many of these mills could not run without the help of the wholesale yard. The report stated that the wholesaler must of necessity search out an outlet for the mixed stock which he thus accumulates; in studying the requirements of the buying trade and post himself as to the thicknesses and kinds of wood for each market, and must also take the lumber to center points for grading and distribution.

In speaking of the retailer, the report said that he should be free from the poacher, but that he should not expect the large contractors and corporations who buy in carlots to be satisfied with any circumscribed area in which to make such purchases.

The report said further that the recent government suit has pointed out just how far trade organizations can go in the matter of distributing information. The report expressed the opinion that while the suit was decided in favor of the government, it appears to give the privilege to every man of selling unmolested his goods to whomever he chooses, and gives the buyer the right to buy his lumber from whomever he chooses.

The report then pointed out the benefits to be derived from association work through increased efficiency and organization, and through credit work.

The paper stated that companies had gotten the opinion that the

injunction granted in the government suit would make a very marked change in the position of the retailer, the wholesaler and manufacturer. The lumber trade is so well organized and so well established, however, that no change whatever has come about, and it would seem to most people that the winning of the suit by the government has cleared the atmosphere to the extent that it will cause the lumber merchant to show a deeper interest in actual conditions.

In the past very often lumbermen have refrained from selling wholesale orders, but the report says that with the increased knowledge due to the clearing up of the situation by the government's suit, this condition will not prevail.

The paper expresses the opinion that the government's injunction does not stop the various retail associations from giving to their members such legitimate information as they may need to conserve their best business interests or to extend to each other such information as will help in the matter of credits, etc.

The report closes with the statement that credit organizations and trade relations matter can be of great good to the country at large if properly conducted, and if frequent conferences are held with open discussion about the methods of improving conditions, having always in mind that good must be done so that it will be for the benefit of all.

The committee on nomination of trustees, relations, etc., was then appointed and the meeting adjourned until the afternoon.

AFTERNOON SESSION

The afternoon session was opened with a report by the committee on terms of sale and trade ethics, read by F. S. Underhill, chairman. The report stated that at last year's convention the committee recommended certain changes in the wording of the terms of sale of the association. These changes were based on the recommendation of the legal department that had found that the order or acknowledgement forms used by association members were defective in that they had resulted in unsatisfactory arrangements between members on various occasions, and would be inefficient if used in court. These forms were changed according to the suggestions by the committee, and the new order of forms can be procured through the association offices. The report told of a letter issued by the board of trustees recommending in connection with terms of sale, that while it is recognized that terms of sale are not uniform, still the practice used by some concerns of making settlements without due or reasonable regard for the terms of the shipper, is unjust and every effort should be made to break it up.

The report said that every member of the association ought to take a firm stand that a discount was in no sense a commission, but merely an allowance made for the express purpose of securing immediate or prompt payments of accounts. The report said that if terms of sale were more uniform throughout the trade many problems confronting the association in this matter would be eliminated.

The report further stated that the wholesaler is more delinquent in insisting upon the adherence to terms of sale than is the manufacturer, and said that it is manifest that such practice as taking the discount from the gross delivered amount of the invoice, including freight, ought to be forcibly handled and the practices broken up. The report also stated that the encouraging of such terms of sales as "two per cent discount from net amount of invoice thirty days after the arrival of car," or "net cash ninety days after the arrival of car" ought to be discouraged, and a determined effort made to discontinue such practices.

A discussion of this report followed.

W. S. Phippen, traffic manager of the association, then delivered his report. The report stated that in addition to freight investigation and collection of freight claims, the transportation bureau had handled for over two hundred individual members several hundred other matters such as tracing and diverting cars, locating and stopping delivery of shipments owing to financial insolvency of consignees, and straightening out cases where carriers

delivered ordered shipments without the bills of lading. Readjustment of rates on hemlock from stations on the Asheville branch of the Southern Railroad were secured; also publication of through rates on the R. F. & P. to points on the Maryland & Pennsylvania Railroad; a water competitive rate of fifteen cents from Norfolk to Neponset, Mass., was obtained and erroneous rates in various other tariffs were corrected. These matters also involved reparations through the Interstate Commerce Commission for amounts aggregating \$500.

The report stated that the Interstate Commerce Commission has ruled that interest shall be paid by carriers on overcharges from the time the money to be refunded has been improperly collected.

In speaking of lighterage conditions in New York, the report said that many complaints were received of damage to lumber from improperly equipped or leaking boats. A thorough investigation was made, and the assurance of better lighterage service and better boats was secured.

After referring to the proposed increase in rates to Canadian points, the report took up the question of the weighing investigation. The various hearings on this question were reviewed. The last meeting was held in Chicago, February 26 and 27. This meeting is reviewed in another part of this issue.

The discussion of the wooden box case referred particularly to the so-called Pridham case in California. The Pridham company manufactures fiber boxes and demanded the same classification on eastbound shipments as on shipments westbound to California. This classification provides that freight shipments in fiber or pulp board packages will take the same rate as goods shipped in wooden packages.

Reference was made to the milling-in-transit question, which was reviewed and the various controversies noted. This question was more fully covered in a previous issue of HARDWOOD RECORD.

The report referred to an order recently made public by the Interstate Commerce Commission of investigations in which it gives notice of its intention of going into the question as to just what should be set forth in a freight bill or receipt. This inquiry is based on the fact that carriers have not in force reasonable regulations and practices affecting receipts or bills for freight charges. It has been contended at different times by wholesalers that some shippers ascertain from railroad agents the name of ultimate consignees, and also that some consignees in the same manner are put in touch with the name of shippers, thereby defeating the business of the legitimate wholesaler.

Referring to the question of undercharge bills submitted by the railroads, the report stated that the commission in a recent report to Congress recommended that the Interstate Commerce Commission act be amended providing that it be compulsory for carriers to collect undercharge bills within a reasonable period, perhaps ninety days, and if not collected until after that time they should be deemed guilty of giving a rebate. No action has been taken, however, and the report suggests that attention along the line of the commissioners' recommendation be given.

B. F. Betts, chairman of the committee on transportation and railroads, then reported. This report reviewed the work of the committee the past year and referred particularly to railroad weighing matters and milling-in-transit. Reference to the hearing before the Interstate Commerce Commission was brought out, which showed that a large proportion of freight cars are unsteered as to actual tare weight, and that scale manufacturers acknowledge that it is impossible to correctly weigh cars coupled and in transit over scales.

Referring to the milling-in-transit question, the report said that the association was requested by the exporters' association to join them in a petition asking for a longer period than forty-eight hours for loading or unloading shipments of lumber of over 50,000 feet, and that half holidays should not be counted in the time period.

The report referred to the agitation for lower rates on inferior lumber. In referring the subject to the board of trustees, it was deemed inadvisable to make any change in the present lumber

rates on the ground that if lower rates were made on boxes, higher rates would soon be established on the better grades.

The report referred to the securing by the transportation bureau of a ruling from the Interstate Commerce Commission which said that it is unlawful for a carrier to disclose to a shipper the name of the ultimate consignee of a shipment re-consigned in transit by the original consignee.

The report of the legislation committee was then read by J. T. Christie, chairman. He said that nothing of importance had been accomplished as nothing had been referred to the committee for its consideration. The chairman said that he had written to the members of the committee recently asking for any suggestions that might be embodied in a report, and the invariable reply was that owing to satisfactory conditions and excellent outlook, they had no suggestions to make for any new legislation.

The special committee on car stakes delivered its report through chairman George F. Craig. The report stated that the position of the lumber shippers on the car stake question was just, and that the majority of roads will admit its justice. Delay in obtaining an equitable settlement is costing the lumbermen many times over the expense incurred in the former efforts, as well as the additional cost of further action. The report concluded with the statement that profiting by past experience there is fair grounds for further prosecuting the contention with reasonable encouragement to expect a renewal of the former decision of the case.

George H. Holt, chairman of the committee on fire insurance, then reported for that body. The report said that more than six hundred bills had been presented during the past year through various legislatures in different states, for the purpose of regulating or controlling fire insurance business. Public sentiment has undoubtedly been aroused and is determined to make itself felt in this question. The report reviewed the various insurance bills which have been adopted in different states, and then turned to a discussion of the so-called arson trust, which is commanding so much attention throughout the country.

The report told of the work being done by the consolidated power of insurance companies to discredit lumber and the use of wood for any purpose. This effort has been along the lines of promulgating building codes and restrictions which are being pressed upon cities for adoption. It stated that the movement has succeeded to such an extent in cities that property owners and architects have discovered that the new enterprises and population are settling in the smaller towns where such restrictions are not in force. Efforts are being made by the same element to have the restrictions made nation-wide ultimately.

The report suggested that the power of the various industries allied in the manufacture of various products of the forests is tremendous, and that by consolidating its influence the insurance evit and the campaign against wood products can be successfully made.

The report then proposed a remedy regarding the buying of insurance, giving a committee of buyers of insurance, not sellers, authority to supervise and place insurance for the group, thus lowering the cost of getting the business to the companies and resulting in better distribution of the risks, and decreasing the fire loss by eliminating the moral hazard. The same committee, according to the suggestion, might be empowered to represent all members in the matter of fire loss adjustment.

FRIDAY'S SESSION

The session of Friday morning was opened by a report of the coastwise insurance committee.

Following the report of this committee, E. R. Babcock, counselor to the Chamber of Commerce of the United States, reported. The report reviewed the efforts leading up to and eventually resulting in the present National Chamber of Commerce, and reviewed the vast scope of power promised through such an organization, which scope has been realized since the effort culminated in the formation of that association. This organization was organized at the Hotel Willard, Washington, D. C., on April 22, 1912. There were approximately 900 delegates present, representing nearly every

industrial and commercial organization in the United States. Harry A. Wheeler of Chicago was elected president, and in addition there were elected four vice-presidents, treasurer, secretary, assistant secretary and various other officers. The various officers were appointed with the idea of having a representation from all sections of the country, and of all kinds of manufacture and commerce.

The report reviewed the sentiment as expressed regarding the many organized chambers of commerce, stating that it is very favorably considered in all official and legislative circles. The speaker reviewed the proceedings of the first annual meeting of the association. The meeting was held at Washington, January 21, 22 and 23. The first annual banquet was held on Wednesday evening during that meeting, and among the speakers were President Taft and Dr. Elliott, ex-president of Harvard University. The speeches of both these gentlemen strongly urged the need of such an organization.

Resolutions were adopted by the National Chamber of Commerce at this meeting on the Page bill, which bill was endorsed in its essential provisions, and urged upon Congress for enactment. This is a bill to provide for compulsory education up to a certain age. The Pomerene bill providing for safeguarding cotton bills of lading against forgery was endorsed.

In speaking of the order of the recent administration providing for examination for entrance to the consular and diplomatic service, the promotion from grade to grade, the association stated that it should be given recognition, stability and permanency by enactment into law. Considering a banking and currency system, resolutions on this question were referred to the board of directors for action.

Resolutions endorsing the idea of a permanent tariff commission were adopted.

This report was followed by a discussion.

John M. Woods reported for the committee on forestry as follows:

Report of Forestry Committee

The committee on forestry respectfully beg to submit the following report:

We view with deep concern the efforts that are being made in Congress and some of the state legislatures to turn over the national forests, their management and resources, to the states in which they are located. We believe these national forests are the property of the whole people and are the most significant and concrete expression of the principle of conservation. Under the present intelligent management of the national government, monopoly of these public resources is prevented, their present and future uses for all the people secured. Once public ownership is surrendered, the three great resources—timber, water and forage—will quickly be monopolized for private advantage. The financial burden for the protection, administration and development of these forests would involve a financial burden far beyond the ability of any state to assume. With the general government in control of these forests a sound, stable policy will be assured, free from any local, political or other influences, whereas, if left to the several states in which they are located, they will be made the football of private interests and political factions. This change can only mean the abandonment of forest conservation as a sound and safe public policy, and presenting to a few states wealth that figures can hardly express, and that rightfully belong to all the states. There is no mistaking the attitude of many senators and representatives toward the ownership and management of these vast national resources. This is shown in curtailment of appropriations and all manner of criticisms. There should be the amplest appropriation for the prevention of forest fires and investigation of the value of what is both above and below the surface and of the practical and financial value of the water of which the forest is the natural storage reservoir. There will probably be an extra session of Congress which will attempt a revision of the tariff all along the line, including lumber and forest products. Your committee does not deem it wise, in view of the probable divergence of opinion existing in our association on the tariff, to make any specific recommendations, believing that all who are interested for or against any change should communicate their views to their senators and representatives in Congress. While the tariff is made a political question, it should be taken out of that domain, and become, as it is a purely business matter and should be worked out as in Germany, by a permanent non-partisan board of competent tariff experts.

We are dealing with a great vital living question affecting the present and future happiness and prosperity of ninety millions of people. Are we, as an association, and individuals, doing our whole duty and making our influence for good felt, not only in our own business, but in that wider field, the public and lawmaking bodies? State and national legislatures are flooded with bills affecting either directly or indirectly every member of

this association. President DeLaney, of the Hardwood Manufacturers' Association, Feb. 4, said: "A subject which should be given attention is the probable enactment, in most states, of a workmen's compensation law in order that just and proper bills may be enacted, and that all states have bills of similarity to prevent confusion. This brings to my mind the vital question of citizenship. Many of us refuse to participate in local politics, fearing revenge at the hands of the politicians. This to my mind is the height of cowardice. As property owners and citizens we should assert ourselves." Your chairman would like to see this association and every commercial organization throughout the land have the moral courage to take up, discuss and vote on the great questions affecting not only our own industry, but the public welfare. It would have great weight with legislators, especially if supplemented by a personal letter of your senator or representative. It seems to me the prayer of every lumberman and good citizen ought to be:

"God give us men,

A time like this demands,

Strong minds, great hearts, true faith and ready hands;

Men whom the lust of office does not kill,

Men whom the lust of office cannot buy,

Men who possess opinions and a will,

Men who have honor, men who will not lie,

Men who can stand before a demagogue

And down his treacherous flatteries without winking;

Tall men, sun-crowned, who live above the fog,

In public duty and in private thinking."

Following the report of Mr. Woods', the advisory committee to the American Forestry Association reported through Chairman R. C. Lippincott. The chairman reported that there was little to speak of in the matter of accomplishment for the past year. There was no communication of the advisory board directly with the American Forestry Association.

The report told of the rapid growth in numbers, financial strength and public prestige of the American Forestry Association and reviewed the effort leading up to the enactment of the Week's bill providing for Appalachian and White Mountain forest reserves. It told of the work that has already been done in the matter of purchasing timberlands for water reserves with the appropriations provided by this act.

The report reviewed the work done in the matter of forest fire prevention, and said that frequent discussions of this question such as are effected through the various meetings of the American Forestry Association, would result in the eventual successful solution of the problem. Already a great deal of valuable and efficient work has been done in the matter of protecting the forests against fire.

Referring to the agitation which has been going on for some time in the matter of the transferring of the national forests to the control of the states, the committee went on record as being distinctly and unconditionally opposed to any such action, and endorsed the policy and accomplishments of the federal forest service, and stated that the attempt to return forest lands to state control is merely an effort on the part of those interested in fraudulent exploitation and national reserves to get state reserves in a position where they are available. The report closes with an appeal to members of the association for membership in the American Forestry Association. All were urged to join who had not already done so.

At the final afternoon session of the organization, on Friday, the following trustees were elected for three years:

N. H. Walcott, Providence, R. I.;

F. R. Babcock, Pittsburgh, Pa.;

R. M. Carrier, Sardis, Miss.;

F. B. Robertson, Memphis, Tenn.;

O. O. Azler, Chicago, Ill.;

J. Randall Williams, Philadelphia, Pa.;

T. M. Brown, Louisville, Ky.

Following the adjournment, the board of trustees held a meeting, and agreeable to the expressed wish of the association, Nelson H. Walcott of Providence was elected president; Gordon C. Edwards of Ottawa was elected first vice-president; W. W. Knight of Indianapolis, second vice-president; Henry Cape was elected treasurer, and E. F. Perry was continued as secretary.

The social feature of the National Wholesale Lumber Dealers' Association convention found its usual expression in a banquet held at the Chelsea hotel, on Friday evening, which brought out the usual large attendance; in fact, the banquet hall was crowded to

the limit to accommodate everyone. A great many wives of members were present.

The speaker of the evening was E. M. MacDonald, K. C., member of parliament, Picton, Nova Scotia. His subject, "Canada," was handled in a very able manner.

J. Hampton Moore, president of the Atlantic Deep Waterways Association, and D. J. Lewis, congressman from Maryland, were also prominent speakers at the occasion.

It goes without saying that in the selection of Mr. Walcott as president of the National Wholesale Lumber Dealers' Association, great wisdom has been displayed. Mr. Walcott is a man who

stands very high in lumber affairs, and is one of the most prominent, aggressive and intelligent members of the fraternity of the entire East. He has been a hard worker for the association for many years, and this is a just recognition of his abilities and talents that is worthy of the organization. He surely will carry the affairs of the organization to still higher standards of good business results and good business morals that have prevailed in the past.

Nothing but words of encomium can be said for F. E. Parker, who has been a very faithful and competent incumbent of the position of president for the past year.

Flooring Factories Progressive

A good deal of ground might be found for the contention that flooring factories, as a whole, are among the most progressive in the entire hardwood and woodworking field. The average manufacturer of hardwood flooring realizes that he is turning out a quality product and that he cannot give too much attention to its manufacture; and while it is said by those who have had experience that the flooring business still needs education on the subject of how to get proper prices for its product, there is little fault to be found in the factory end, at all events.

One feature of flooring factories that commends itself is the way in which dry kilns are made use of. In proportion to the amount of lumber consumed, it is probable that the well-managed flooring factory has a larger kiln capacity than the typical plant in any other line. In fact, a big manufacturer recently stated that he had enlarged his kilns to a considerable extent with the idea of reducing the cost of handling material to the minimum. This is possible in a good many cases, because the flooring factory is often located in a hardwood lumber market, so as to enable the manufacturer to pick up his oak without much trouble, and to get prompt deliveries.

When conditions are favorable, the factory can be operated at full capacity with no lumber being handled in and out of the yard whatever. The operations of the kiln can be adjusted so that lumber received is put into the drying apparatus, instead of the yard, and taken out for immediate use, so that there is no necessity for piling the material on the yard, and then rehandling it when the time comes to put it into the kiln. If this method can be worked out, a saving of something like \$1 a thousand on the lumber used is effected, less the cost of building and maintaining the additional kilns made necessary by this system.

A stunt which is said to affect production costs favorably in a good many flooring factories, especially those making plain oak, is ripping the strips on a gang edger. It is worth noting that the custom is confined almost entirely to those using plain oak, as quartered oak flooring manufacturers as a rule contend that the character of their material does not warrant the use of the gang edger for ripping purposes. The obvious advantage is secured in the greater volume of work that can be done, and the greater accuracy of the work; for, say what you will, there are bound to be inaccuracies in ripping on a single saw, for the sawyer cannot hold the strip against the guide firmly and evenly enough to insure absolute accuracy, as is certain to be the case when the piece is cut between two saws.

Some flooring manufacturers who have investigated this plan believe that the chance for waste is greater on account of the fact that the work is done more or less mechanically, the material being fed into the edger without any opportunity for discrimination and selection to be exercised. But the waste problem cannot always be taken care of at the saw; it calls for a broader policy than that. In fact, one of the big factories which does use gang edgers in ripping has a remarkably small amount of waste, because it takes occasion to work all of its offal into narrow stock like crate material, binder strips, etc.

But it is plain that when a manufacturer is producing quartered oak flooring, and has a chance to save money by the proper use of his lumber, there are plenty of opportunities for him to do so if he is ripping his stock on a single saw. One flooring concern which uses this plan turns out little or no 1 1/2" select flooring, throwing out strips of that grade to be worked into something else for which there is a better demand and on which there may be more profit, confining its production of this particular thickness to clear flooring, and working up selects, by means of resawing, into thinner stock.

By putting it up to the experienced sawyer to get the most out of the lumber that there is to be had, the manufacturer insures losing no values in high-priced quartered oak and similar material. He pays more for labor, of course, and it is simply a question of determining which element is the most important in dollars and cents.

The situation may be likened to that in the sawmill business. In a good many small mills, turning out high-priced lumber from high-priced logs, the manufacturer cuts all thicknesses, every log being carefully scanned and sawed into the dimensions which will produce the best grades. In this way the lumberman loses nothing of the value of his timber. But on the other hand when the operations of a big mill cutting from 50,000 to 100,000 feet of lumber a day are investigated, it is customary to find attention being concentrated on a few thicknesses; sometimes on one, such as inch lumber. The manufacturer in this case is concerned principally with getting out a big production in order to keep his manufacturing costs low. This he has to do because of his large overhead expense. The smaller plant has an entirely different problem, and handles it differently.

Another interesting department of the flooring business is the warehouse proposition. Inasmuch as flooring is used in construction work, sales are a seasonal proposition. The extent of the periods may depend on the selling system employed by the manufacturer, and will be affected by whether he sells through jobbers, who in turn sell to the contractor, or direct to the latter. But in any event it is usually necessary to store a considerable amount of stock to take care of the heavy business which it is known will come later.

Adjusting the capacity of the factory to the facilities of the warehouse, and vice versa, is a nice problem for the flooring man. Shall he attempt to make capital out of his storage facilities by keeping his plant going at top speed all the time, and carrying a lot of flooring in stock, compared with the daily output of the factory; or shall he increase his manufacturing facilities, using the warehouse merely as a means of tiding over the occasional dull periods, and not as an actual complement of the manufacturing end of the business?

If a big warehouse is put into service as a kind of reservoir, into which is put stock which will not be sold for some months ahead, the manufacturer immediately faces a charge for interest on this idle capital; but he makes up for it in having a smaller investment in machinery, and in being able to operate his plant

at the maximum efficiency by running full time all the year round. The man with the big factory and the relatively small warehouse must cut down his operations now and then to wait for the market to catch up with him; the other man, having figured this variation in the demand in advance, is less troubled with fluctuations, due, as indicated, to the seasonal character of the business.

Flooring factories as a rule are giving more attention to the human factor than most other branches of the lumber and allied trades. For instance, over each of the planers in a southern hardwood flooring plant is a sign carrying the word, "Think!" While the effect of this legend upon the operatives doubtless becomes less with the passage of time, it is an admonition that must have a lot of real effect. And in the same plant the production of the various machines is listed daily, comparisons with previous years being kept, so that the men can see whether they

are keeping up with their competitors, and whether the factory as a whole is doing as well as it formerly did. This stimulates interest and develops the spirit of competition which is relied upon by many to aid in the work of an industrial organization.

In the same connection, as well as from a mechanical standpoint, the uniform attention given to lighting is of interest. In one big factory which the writer visited not long ago, the wall was practically made of glass; while overhead skylights furnished additional natural illumination. The relation of good daylight to good work is better understood in the metal-working trades, probably, than in woodworking; and flooring men who have seen the advantages, with the idea of aiding the condition and increasing the comfort of their men, of good lighting are realizing upon whatever additional investment is required to get it in the form of better work and fewer accidents.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 407—Seeks Oak and Ash Truck Poles

New York, N. Y., Feb. 25.—Editor HARDWOOD RECORD: We would like to have the names of some reputable sawmills who want to supply and who know how to properly cut good oak and ash truck poles.

Trusting you may be in a position to let us have this information, and thanking you in advance for your courtesy, and with best wishes we remain,

The above has been supplied with a list of manufacturers of wagon stock, who would probably be in a position to cut the stock desired.—EDITOR.

B 408—In the Market for Ash Logs

Boston, Mass., Mar. 4.—Editor HARDWOOD RECORD: Can you give us the addresses of some small mills that manufacture ash or could you give us any information regarding parties who might furnish several cars of ash logs? COMPANY.

A list of ash lumber producers and a source of supply for ash logs has been furnished the above correspondent. Would be pleased to hear from handlers of ash logs who would like to be placed in touch with this prospective customer.—EDITOR.

News Miscellany

Chicago Weight Hearing

The last hearing on railroad weights was held in Chicago on Feb. 26 and 27. At this hearing, in answer to Commissioner Prouty's statement that what was desired was some method of settling disputes in regard to weights, Mr. Maegly of the Santa Fe explained that committees of the American Railway Association have the matter in hand, and will probably present a partial report at the May meeting of that association. Mr. Hale, chairman of the American Railway Association, made the following suggestions which he thought should be covered in the briefs and arguments which might be filed with the commission:

- Light Weights of Cars:
 - Rules, reports and tolerance.
- Standards of Scales and Weighing:
 - Weighing machine tolerance.
 - Weighing in motion—uncoupled at both ends.
 - Weighing in motion—coupled at both ends.
 - Weighing standing—uncoupled at both ends.
 - Weighing standing—coupled at both ends.
- Rules—Uniform:
 - Test weighing.
 - Railroad and shipping weights.
- Miscellaneous:
 - Pilfering.
 - Refuse and clean cars.

Commissioner Prouty stated his belief that the railroads should file briefs and also argue the matter before the commission. He said that the lines suggested by Mr. Hale were substantially what he had in mind, except that he would put at the head of the list the question of federal control as to the whole matter of scales and their operations and the extent to which such control should go. He wanted to know, under the matter of tolerance, what was the limit of accuracy that might be expected

from the track scales and what was to be done when discrepancies in weights occur. He thought that weighing should be done as early as possible after the shipment was in the custody of the carrier and that the shipper should be notified of the weight obtained at that time and that that weight should govern throughout, unless changed for very satisfactory reasons. He also thought that if change was made by the carrier, the shipper should be notified, because, under the present practice, the shipper never knows of the change until complaint is made to him by the consignee, when it is too late to determine whether the complaint is well founded.

The hearing was adjourned to Mar. 10 at Philadelphia, and it was stated that the case would probably be argued about the first week in May and that anyone desiring to prepare a brief or submit argument should notify the commission prior to Apr. 15.

Meeting Baltimore Exchange

The monthly meeting of the Baltimore Lumber Exchange, held Mar. 3, while largely attended and very enjoyable, was productive of little business. Only some routine matters received attention, the business session lasting hardly more than fifteen minutes. The members then adjourned to the dining hall, where an excellent luncheon, served in the best style of the club, was partaken of. About fifty lumbermen were present, one of the visitors being K. C. Evarts, secretary of the Retail Lumber Dealers' Association of the state of New York, with headquarters in the Chamber of Commerce building at Rochester. President Theodore Mottu of Theodore Mottu & Co., occupied the chair, and L. H. Gwaltney of the American Lumber Company, was secretary.

Meeting of New Jersey Lumbermen

The annual meeting and banquet of the New Jersey Lumbermen's Protective Association was held at the "Washington," this city, Feb. 26. The business session was called to order by President Geo. A. Smock at 2 o'clock. There were over 150 in attendance.

Reports of officers and committees were read reviewing the work of the past year. Special attention was given to the suit of the government against the Eastern States Retail Lumber Dealers' Association, of which the New Jersey association is a member. A. B. Cruikshank, counsel for the lumbermen, addressed the meeting and reviewed the decision of the circuit court, which was adverse to the associations. He pointed out that the court ruled in favor of the lumbermen on all questions of fact, reducing the decision to one of pure law. The directors of the association had previously voted in favor of taking the case to the Supreme court at Washington, and Mr. Cruikshank's talk at the meeting roused the membership to great enthusiasm, and by vote the association went on record as favoring appeal to the highest court. The course followed by counsel and the special defense committee was also endorsed.

Jas. Sherlock Davis and John F. Steeves, lumbermen of New York, members of the defense committee also reviewed the case.

A tentative draft of proposed changes in the by-laws and constitution was read to the meeting and referred to a committee of three to report back at a special meeting of the association.

The election of officers resulted as follows: President, I. Newton Rudgers, Montclair; vice-president, M. T. Brewster, Little Ferry; treasurer, J. F. Glasby, Newark. Directors for three years: I. A. Collins, Morristown; H. V. Weeks, Weehawken; W. D. Gulick, Washington; S. H. Vanderbeek, Jersey City, and S. F. Bailey, Newark.

The chief speaker of the evening was Gov. Fielder of New Jersey, who succeeds President-elect Wilson. Mr. Fielder addressed the diners and spoke on the lien law, a subject of peculiar interest to the material men of the state who have been trying for some time to have the law changed in some respects. Mr. Fielder has consistently opposed the dealers and took occasion to explain his attitude. He closed with some complimentary remarks for his distinguished predecessor.

During the courses there was much entertainment and good music and a word of praise for the committee in charge is in order.

Monthly Meeting Cincinnati Lumbermen's Club

At the regular monthly meeting of the Cincinnati Lumbermen's Club at the Business Men's Club March 3, there was much gloom and sadness over

the absence of one member whose sterling qualities and cheerful countenance was so much in evidence at former meetings, and in the death of ex-President Cliff S. Walker the club realizes that it has lost a worthy member and capable advisor. President Shiels in opening the meeting could not refrain from eulogizing the departed member and appointed a committee composed of J. A. Bolser, S. W. Richey, W. A. Bennett, Ralph McCracken and W. E. Heyser to draw up suitable resolutions to be handsomely mounted and sent to the family as a reminder of the esteem in which this most estimable gentleman was held by the entire membership.

After the usual dinner was over, the minutes of the previous meeting had been approved, and a number of communications of more or less importance were disposed of, a matter that most of the members are much interested in was taken up, namely, that of creating a boulevard out of the present canal which runs through the heart of the city and has been an eyesore for years. Chas. H. Zuber of the Canal Improvement Association made a strong appeal for the club's assistance. He was given it cheerfully, a committee consisting of H. J. Pfeister, chairman, E. F. Dulweber and V. B. Kirkpatrick being appointed to lead every effort to have the improvement made as soon as possible.

A number of rate questions came up, and Guy M. Freer, traffic manager of the Chamber of Commerce and Emil Thoman of Bennett & Witte were delegated to take up the matter and make a thorough investigation, which will likely require a trip to St. Louis to attend a meeting that is to be held there before very long. Two new members were elected to membership; the Tennessee Lumber & Coal Company and the Prendergast Lumber Company, which have lately established a hardwood yard here.

Hearing on Hardwood Rates for Export

A hearing was held before the Interstate Commerce Commission at the Hotel Jefferson, St. Louis, on Feb. 28, in the case of the National Lumber Exporters' Association vs. the St. Louis, Iron Mountain & Southern Railroad and the Texas & Pacific Railroad. The case pertained to the rate on hardwood lumber for export from certain points in Arkansas to New Orleans. The National Lumber Exporters' Association is asking for a reduction to fourteen cents from some stations in the territory and to twelve cents from other stations. It claims that it cannot compete with Memphis, Tenn., at the present rate on hardwood lumber from Memphis to New Orleans. The railroads contended they had a right to maintain the present rate, while the National Lumber Exporters' Association claimed that the railroads are discriminating against certain dealers in favor of Memphis lumbermen. Commissioner Prouty of the Interstate Commerce Commission ordered the National Lumber Exporters' Association to file a brief within fifteen days after the testimony was received and the railroads to file a brief within thirty days after they received the testimony.

Meeting Memphis Lumbermen's Club

At the semi-monthly meeting of the Lumbermen's Club, held at the Hotel Gayoso, Saturday, Mar. 1, the dues of active members were raised from \$10 to \$15 per year, and it was also decided by way of amendment to the constitution and by-laws, that the annual banquet could be held at any time provided a majority of the members favored this course. It was specifically declared, however, that all attending this function should pay for each plate used by themselves or guests, thus making the function self sustaining.

An effort was made to change the method of electing officers, providing that these should be nominated and elected the same evening. This was unanimously voted down, however, as nearly all the members believe that the present active campaigns made each year are among the chief assets of the club in the way of keeping up interest and attracting new members. This proposed amendment brought forth a great deal more discussion than any of the others. It was designed to do away with the necessity of giving up a considerable amount of time on the part of the nominees to the election campaign. Those who spoke against the change, however, were of the opinion that those who were not willing to give a little time toward securing the election would not be in position to give the proper amount of time and attention to the affairs of the club after being elected.

John W. McClure, chairman of the river and rail committee, called attention to the fact that there was a great deal of difficulty in getting shippers to attend the hearings before the Interstate Commerce Commission, in which they were interested. He said that a bill had been introduced into the United States Senate by Mr. LaFollette dividing the entire shipping territory in the United States into zones, with all hearings affecting that zone to be held by the commission at the largest point therein. He believed that the Tennessee representatives in Congress should be petitioned by the club to introduce a similar bill. He said that Mr. Prouty, while chairman of the Interstate Commerce Commission, had spoken publicly in favor of this plan. The resolutions, which were unanimously adopted, provide that other similar organizations be requested to take this matter up with their representatives. W. B. Morgan, chairman of the traffic division of the Business Men's Club, said that he had already asked the directors of that organization to adopt resolutions along the same line.

Mr. McClure also reported that a conferece had been arranged with officials of the Illinois Central Railroad Company, through which it is sought to correct overcharges in connection with overweighted lumber and log shipments.

Mr. McClure also called the attention of the members to the ruling that, in filing claims for overcharges, they were entitled to interest on all refunds growing out of errors in rates. He said that the awards of the Interstate Commerce Commission always bear interest from the date the improper rates are put into effect, and that this ruling had been made applicable to refunds growing out of rates through error.

J. H. Townshend, manager of the Southern Hardwood Traffic Bureau, informed the club that the hearing before the Interstate Commerce Commission, scheduled for St. Louis Mar. 10, had been changed to Memphis. This action on the part of the commission, he said, grows out of the fact that the railroads west of the Mississippi river have temporarily withdrawn the proposed advance in rates from that territory.

Three new members were elected as follows: C. L. Crenshaw of W. L. Crenshaw & Co., Edgar A. Leer of the Green River Lumber Company, and Thomas J. White of Bennett & Witte. Five applications for membership were also filed, three active and two associate. These applications will be voted on at the next meeting.

W. B. Morgan advised the club that the president of the National Wholesale Lumber Dealers' Association had spoken very warmly in favor of Memphis as the next meeting place. The club decided, in the light of this information, to go after the annual for 1914, and instructed the delegates from this city to extend an invitation to that effect. C. B. Dudley, F. B. Robertson, J. W. Thompson and other prominent lumbermen, attended the annual at Atlantic City, Mar. 5 and 6.

New Vice-Presidents Hardwood Manufacturers' Association

The following is a list of state vice-presidents as appointed and announced by President W. E. Delaney on March 8:

ARKANSAS—J. F. McIntyre, J. F. McIntyre & Sons, Pine Bluff, Ark.
 GEORGIA—W. H. Shippen, Shippen Brothers Lumber Company, Ellijay, Ga.

ILLINOIS—William Wilms, Paepcke-Leicht Lumber Company, Chicago, Ill.
 INDIANA—Claude Maley, Maley & Wertz, Evansville, Ind.
 KENTUCKY—Floyd Day, Swann-Day Lumber Company, Clay City, Ky.
 IOWA—Elmer W. Harris, Harris & Cole Brothers, Cedar Falls, Ia.
 LOUISIANA—E. B. Schwing, Schwing Lumber & Shingle Company, Plaquemine, La.

MASSACHUSETTS—W. E. Litchfield, Wm. E. Litchfield, Boston, Mass.
 MISSISSIPPI—S. E. Anderson, Anderson-Tully Company, Memphis, Tenn.
 MISSOURI—W. P. Anderson, Gideon-Anderson Lumber and Manufacturing Company, Gideon, Mo.

NORTH CAROLINA—W. I. Grandin, Grandin Lumber Company, Lenoir, N. C.

OHIO—Thos. J. Moffett, Maley, Thompson & Moffett Company, Cincinnati, Ohio.

OKLAHOMA—D. A. Anderson, D. A. Anderson Lumber Company, Redlands, Okla.

PENNSYLVANIA—F. A. Kirby, Cherry River Boom & Lumber Company, Philadelphia, Pa.

SOUTH CAROLINA—N. W. Gennett, Gennett Lumber Company, Franklin, N. C.

TENNESSEE—S. Lieberman, Lieberman, Loveman & O'Brien, Nashville, Tenn.

TEXAS—A. Deutsch, Sabine River Lumber and Logging Company, Flanagan, Texas.

VIRGINIA—N. W. Easterly, Lebanon, Va.

WEST VIRGINIA—Peter Carroll, Clay Lumber Company, Charleston, W. Va.

Imports and Exports for January

The regular monthly summary of imports and exports gives a total of wood and manufactures of wood imported into this country during January, 1913, of \$3,845,655. This marks a slight increase over the value of imports for January, 1912, which aggregated \$3,413,115. The import value of mahogany during January, 1913, was \$298,000, as against \$200,323 January, 1912. The total import value of pulpwoods January, 1913, was \$353,430, as compared to \$283,353, January, 1912. Under the manufactures of lumber, such sawed lumber as boards, planks, deals, etc., aggregating in value \$877,603, were imported during the past January. For January the preceding year, the import value of the same commodities was \$541,608. The import value of furniture practically doubled during the year, being \$111,111 January, 1913. Wood pulp totaling in value \$1,269,774 was imported during January, 1913. In January, 1912, the value of this commodity aggregated about \$200,000 more.

The total export value of wood and its manufactures was \$9,477,430 in January, 1913, as against \$7,966,242 January, 1912. Total export value of logs and other round timber, including hickory, oak, walnut and others, was \$425,260 last January, and the preceding January was \$278,471. The total export value of hewn and sawed timbers was \$1,064,092, January, 1913, which is considerably more than twice the export value of the same commodities January the year before. Such manufactured lumber as boards, planks, deals, joists and scantling in the various kinds of woods were exported from this country January, 1913, to the aggregate value of \$4,799,752, as against \$3,797,012 January, 1912. Thus it will be seen that the value of export lumber increased practically \$1,000,000 during the year. The value of railroad ties exported the past January was \$172,786. Shingles showed a satisfactory increase, as did box shooks. The value of export staves practically doubled, while about \$100,000 was added to the value of export furniture.

Death of Cliff S. Walker

Cliff S. Walker, president of the Bayou Land and Lumber Company, vice-president of the Tensas River Lumber Company, both of Cincinnati, O., and an ex-president of the Cincinnati Lumbermen's Club, died at his home in Covington Sunday morning, Feb. 23, after an illness of several months, death resulting from a general break down followed by complications. Mr. Walker was one of the best-known and most beloved lumbermen in this section, as well as a very successful business man. He had resided in Covington, Ky., most of his life time and was recently, since his illness, elected to the board of education of Covington, which position he was never able to fill owing to ill health. He resigned for that reason a few weeks ago.

Mr. Walker was born Jan. 4, 1855, in Newport, Ky. His mother was Eliza Lee Stuart of Maysville, Ky. His father, William Perry Walker of Flemingsburg, Ky., was a steamboat owner, plying between Cincinnati and New Orleans, in which vocation he was succeeded by the deceased, who became a very well-known and successful steamboatman, after the completion of his education, which was had at the Chickering Institute. He was married to Tillie Talferro Armstrong in 1879 at Augusta, Ky. Mrs. Walker's home. Of this supremely happy marriage, one son, Stuart, was born who is now manager of the David Belasco Theatrical Company of New York City.

In 1884 Mr. Walker took charge of the old River and Railroad Transfer and was manager of this property for about eight years, at the end of which time it was sold to the C. H. & D. Railway. He became traveling freight agent for the C. H. & D. at that time and later became the general southern agent for this line, in which capacity he met many of his present friends among the lumbermen. When the C. H. & D. was sold, he left the road and became president of the Southern Croosofing Company of Slidell, La. After a few years his health began to fail and he came north again in 1907 and established the Bayou Land and Lumber Company, of which he was president.

He was twice elected president of the Lumbermen's Club, his re-election being the source of much happiness to him. During his first term he inaugurated the now well-known policy of the club known as the "square deal," being a compulsory arbitration of differences when lumber shipments are in dispute. The policy has been successfully followed ever since. He was a thirty-second degree Mason, belonging to Covington Lodge, Covington Chapter and Covington Commandery. Mr. Walker was noted for his kindness of heart, his gentle spirit being much in evidence on many occasions well remembered by his host of friends in the lumber trade and elsewhere. During the latter part of 1912 his health failed rapidly and on Dec. 4, he took to his bed and passed away on Feb. 23, at the home, 219 Garrard St., Covington, Ky., in which he took so much pride. The funeral was held at 11 a. m. Tuesday, Feb. 25, and was well attended by the members of the Lumbermen's Club, the honorary pallbearers of the club being President Chas. F. Shiels, Secretary J. A. Bolser, W. A. Bennett and S. W. Richey. At beautiful Spring Grove Cemetery in Cincinnati the remains were placed tenderly in the vault for the present, the intention of the family being to erect a suitable mausoleum.

Chicago Lumbermen's Club Has Two Tickets

Monday, Mar. 17, will be the date of the first annual meeting and election of officers of the Lumbermen's Club of Chicago. In addition to the regular ticket provided by the By-laws another ticket, designated as the "members' ticket," has been put in the field.

The officers on the regular ticket are: President, F. R. Gadd; vice-president, John Clancy; treasurer, S. C. Bennett, and secretary, T. A. McElreath.

The members' ticket will be made up from the following: President, E. H. Defebaugh; vice-president, Ben Collins, Jr.; treasurer, Robert Sullivan; secretary, A. H. Ruth.

The trustees on both tickets are the same.

Purchases Mill on Honey Island

The Louisiana Hardwood Lumber Company, located at Honey Island, La., recently sold out its entire plant and property to the Globe Packing Box Company, of New Orleans. The transaction involved a tract of 15,000 acres of hardwood timber, a band mill, tram road and smaller mill equipment. The Globe Packing Box Company will, shortly, begin the construction of a large veneer plant adjoining the present property.

The mill is located on Honey Island between the East and West Pearl rivers, forty-five miles north of New Orleans, on the N. L. & N. O. railroad. S. S. Levy, of New Orleans, is president, and L. M. Levinson, of the same city, is general manager of the new company.

The Southern Hardwood Company Organized at Louisville

The Southern Hardwood Company is the style of a new incorporation under the laws of Kentucky to operate at Louisville. The concern will have a capital stock of \$10,000 and will do a general wholesale lumber business in all southern hardwoods, yellow pine and cypress.

J. M. Wells, prominently known for his connection with the sales departments of various large hardwood operations, is president and general manager of the new company. Mr. Wells has spent a great deal of his time in close touch with the selling and producing end of lumber, his first connection having been with the Tallahatchie Lumber Company at Philipp, Miss. From this concern he went with the Lucas Land & Lumber Company, of Paducah, Ky., and recently changed his connection, going with the Sherrill-King Mill & Lumber Company, of the same place. He was sales manager in all three locations.

The Broom Handle Market

This has been one of the most surprising and at the same time one of the most pleasing seasons that the broom handle trade has ever known. Trade was very slow in starting last fall and came in spurts as most of the broom men bought handles in small quantities and then only just when they had to have them; but when they did commence to buy they soon had the handle men bustling, as nearly all the factories wanted to buy low grades, something that had always before been hard to dispose of. It seemed that all the broom men were trying to reduce expenses and were trying out cheaper handles. Some of them found that the cheaper handles were all right for their class of trade and they have continued to use them, while others have had to go back to the purchase of nothing but the highest grades of handles. This in itself is very pleasing to the handle manufacturers, as it has been rather difficult in past years to dispose of all the low-grade handles that were made, and in fact large quantities of them were exported. This has been one cause of higher grades advancing in price every year. The low grades have always and are yet sold at a price that will not pay for the lumber used in making them, and the high grades would have to sell for a price high enough to pay for the loss on these and make a profit on the entire output. There is no doubt that if the trade had not been brisk enough on the low grades this past season, so that the prices on them could be raised, the price on the higher grades would have advanced at least two dollars per thousand. This increase is coming this fall and will probably amount to an average of one dollar per thousand and on all grades of handles. This will be necessary as hard maple lumber has advanced from two to four dollars per M feet during the past six months and labor keeps asking more all the time. The price of lumber has reached a point where the broom handle man cannot use first and second lumber for handles. The waste problem is the worst thing to contend with in using the lower grades of lumber, but it has to be met and worked out. It is possible to cut

THE LATE CLIFFORD S. WALKER.
CINCINNATI, O.

a good deal of dimension stock out of the cuttings from the ends of the maple boards. This will bring in from two to three dollars less than the lumber cost in the first place, but it is better than throwing it away or burning it up, as was formerly done. The edgings from the rip saw and the cull squares from the lathes are worked into strips for special purposes that have a sale at some price, and the cull turned handles can be worked down into handles for tow brooms. All these assist in making up the sales account, and while none of these items will pay a profit, yet they are all made from stock that was formerly burned up as waste. Now if some way or place can be found to sell all sawdust and shavings at a price a little better than the cost of getting them ready or rather of putting them in shape to handle, the handle man will be then really getting everything out of the lumber that it is possible to get. The idea of every handle man is to get as much out of his lumber or logs as it is possible and to make as few low-grade handles as he possibly can; but it seems that no matter how carefully the lumber and the squares are graded, the manufacturer gets more of them than he cares for.

New Paving Block Specifications

Last week the Association for the Standardization of Paving Materials held a four days' session at the Fort Pitt hotel, Pittsburgh. The paving block committee went into executive session on Thursday and finally brought out these recommendations:

First, that black gum be eliminated as paving block material.

Second, that Oregon fir be used in territory from the Canadian line to southern California and along the Pacific Coast.

Third, that larch might be used in the Central West, although this wood is now included in its present recommendation under a synonym.

Fourth, that long-leaf, short-leaf and loblolly pine be admitted to speci-

fications, and that in yellow pine specifications the average number of annular rings be reduced from eight to seven and from a minimum of six to five.

Fifth, that the gravity of oils used in paving blocks be not less than 1.08 nor more than 1.14 at a temperature of 38 degrees centigrade.

Sixth, that specifications for light gravity oil be retained only that more water be allowed.

Seventh, that oil preservative be changed to be not less than sixteen pounds per cubic foot.

Eighth that in localities where certain woods have been found by experiment to be satisfactory these could be specified in paving block contracts.

Baltimore Concern Fails

Disaster has overtaken another hardwood exporter, Robert McLean, who occupies offices in the Stewart building, Lombard and Gay streets, and who petitioned the United States court here, on Feb. 21, for the benefit of the bankruptcy act. Thomas Foley Hiskey has been appointed referee to take testimony, and the matter is to come up on March 13 for a hearing. Mr. Hiskey will later make a report to Judge Rose on the matter. Mr. McLean, who has been engaged in the export business for a number of years, gives his liabilities as \$66,639.86 and his assets as \$19,465.72. He states that his troubles are mainly due to the wiping out of about \$35,000 by the receivership of the Norva Land and Lumber Company, of which he was an officer, the property of the company having been bid in by some of the stockholders, and the stock thus being wiped out. He had been abroad trying to make arrangements whereby he might be enabled to tide matters over, but was not successful. His embarrassments do not, in any way, affect the Battery Park Lumber Corporation, in which he is an officer, and which operates a mill at Battery Park, Va. Mr. McLean, in his export business, has made a specialty of gum, and has made quite a market for it.

The New Cartier Mill Nearing Completion

About ten months ago the Cartier-Holland Lumber Company was organized at Ludington, Mich., to do business in the manufacture and wholesaling of forest products, and to handle timberlands. The principals in this company are Charles E. Cartier and Edward M. Holland. From its inception the company has been successful in gaining recognition in the trade, both through the esteem with which the trade has always considered the name "Cartier" in connection with the manufacture of lumber, and because of the excellent reputation Mr. Holland has always enjoyed among the buyers of forest products.

A few months ago the entire plant was burned to the ground. Plans were immediately formulated to erect on the site of the old plant a modern mill, which would embody every feature that should be contained in an up-to-date northern lumber manufacturing plant. Authorities on mill construction were taken into consultation, and as a result of their efforts a model sawmill plant was mapped out. Work was begun in the early part of January, and the end of the month of February saw the entire outside structure of the mill completed.

The plant is of mill construction covered with corrugated iron, and special attention has been given to the matter of ventilation and lighting with the idea of insuring high-class work on the part of the sawyers, and further of eliminating as far as possible the hazard to workmen.

The construction of the lower floor and the arrangement of machinery is such that fire is almost impossible. A feature which will insure an abundance of light and ventilation is a cupola running the full length of the building, which will connect both ends of the filing room. Sufficient area has been allotted for the workmen on each machine so that they will not be cramped in the slightest in their operations.

The band sawing machinery which will consist of a single band mill and resaw, is being supplied by the McDonough Manufacturing Company of Eau Claire, Wis. The mill will be of the largest eastern type, namely, nine-foot wheels, with fourteen and sixteen-inch saw blades, while the resaw will have eight-foot wheels with twelve and fourteen-inch saw blades. The edger will be of the Pacific coast type with eighty-four-inch

arbor, and the trimmer will be of the latest overhead type operated by hand levers.

The newest ideas in carriage construction will be incorporated in the carriage, which will be equipped with cast steel knees, assuring light weight, and will be operated by twelve-inch shotgun feed. It will have the most modern type of hand set works with steam helper allowing for a set of a one-hundredth of an inch, thus insuring absolute accuracy of manufacture. The manufacturers of the mill claim that it will have a capacity of from 65,000 to 75,000 feet of mixed hardwoods and softwoods per day of ten hours. In short, when the mill is completed it will be the most up-to-date in the western section of Michigan.

In addition, the yard is also being reconstructed. The sorting table is being placed in such a position that there will be ample facilities for assorting lumber with a minimum haul to the lumber pile. The entire product of this plant from the woods to the consumer is being looked after by the Cartier-Holland Lumber Company, and with the timber it holds and the splendid new mill equipment, it will be well qualified to give the consuming public the very best there is in lumber.

The Cartier-Holland Lumber Company wishes it to be known to its friends in the trade that it will be a pleasure to show visitors through the plant at any time they are in the vicinity of Ludington.

Linderman Company Has Beautiful Catalogue

The same idea of quality carried out in the manufacture of its products is noted in the recently issued catalogue of the Linderman Machine Company, Muskegon, Mich., manufacturer of the famous automatic dove-tail glue jointer. The paper is bound in stiff gray card-board with an embossed cover showing a representation of the machine embossed in lighter gray and also the Linderman inscription. The very highest character of printing and engravers' work is carried out throughout the catalogue.

The contents include the introduction describing the factories, and giving the history of the development of the Linderman company. Then follows a minutely and beautifully illustrated description of the machine, in which is shown the application, operation, indirect value and adjustment. The construction is described in illustrated detail, cuts being shown of the frame, pressure bar, bearings, track and chain, cutters, taper-wedged mechanism, rip-saw and edger and evening device. The products of the machine are described, showing that quality and strength are added by gluing up according to Linderman methods. It has been demonstrated that a piece of wood jointed by the Linderman machine will invariably break not along the line of the joint, but in some other part of the wood when subjected to enough pressure. The application to the manufacture of door cores and panels, and many other lines of special work are amply described. The description closes with information as to the capacity of the machine and a technical analysis.

Arkansas National Forests Show Profit

The Ozark and Arkansas national forests in the state of Arkansas netted considerable cash profit, which will be apportioned among the different counties in which the forest lands of the government are located. The apportionment will be based on the revenue realized from the respective counties. These revenues were the result of sales which were equally divided between the two forests. The Ozark forest is located in the northern part of Arkansas and runs mostly to hardwoods, while the Arkansas forest is in the southern part and contains mainly short leaf pine stumpage.

Every sale of government timber is under the direct charge of a ranger or an assistant, who inspects every tree before it is felled. The felling must be done according to government instructions.

B. & O. Proposes Extensive Improvements

President Daniel Willard of the Baltimore & Ohio Railroad Company, announced extensive plans for improvements at a hearing before the Public Service Commission of Maryland last week, when the application of the company to issue \$63,250,000 in 4½ per cent convertible gold bonds and \$57,500,000 in stock was tentatively granted. Mr. Willard stated

NEW CARTIER-HOLLAND MILL, JANUARY 1—SKELETON CONSTRUCTION.

NEW CARTIER-HOLLAND MILL END OF FEBRUARY—STRUCTURE COMPLETED.

that in addition to the \$24,500,000 in improvements nearing completion, the company intended to spend in the next few years beginning with June 30, about \$27,000,000 more. Of this total \$750,000 will go for Baltimore terminals and \$100,000 more for light and power. A double track bridge over the Alleghany river at Pittsburgh will cost \$2,500,000 more. The Chicago terminal betterments contemplated will call for an outlay of \$1,000,000, and the construction of fourteen and one-half miles of double track from Orleans Road to Little Capon, W. Va., will be the largest single item to be undertaken, requiring not less than \$7,000,000. Stations are to be erected at various places, and other improvements made.

Building Operations for February

Official reports from some fifty cities throughout the country, compiled by The American Contractor, Chicago, show a gain for February of 9 3/4 per cent in the aggregate, as compared with February, 1912; and the first two months gained 14 per cent as compared with the same months of the past year. The gains and losses were about equally divided in the list. Gains of over 100 per cent, for February, were made as follows: Akron, 221 per cent; Cleveland, 193; Indianapolis, 484; Newark, 128; Pittsburgh, 112; St. Joseph, 108; Seattle, 209; Sioux City, 186; Syracuse, 225. For the two months the largest percentage of gain was scored by Indianapolis, 244, and Sioux City, 294. Particulars will be found in the following tables:

City—	February, 1913.		February, 1912.		Per Cent	
	Cost.	Gain.	Cost.	Loss.	Gain.	Loss.
Akron	188,165	58,475	221
Atlanta	516,681	402,337	28
Baltimore	725,135	532,070	35
Buffalo	347,000	1,228,000	70

Total	\$37,414,160	\$34,084,505	9 3/4

Forest Products Exhibition in Pennsylvania

The Pennsylvania Forestry Association is planning to give a Forest Exhibition in Horticultural Hall, Philadelphia, during the week from May 19 to 24, inclusive. The association has the co-operation of the United States Forest Service, the Pennsylvania Forestry Department, Pennsylvania State College, Philadelphia Commercial Museum, University of Pennsylvania, Chestnut Tree Blight Commission of Pennsylvania, the National Reclamation Service, Philadelphia Lumbermen's Exchange, American Association of Nurserymen, Pennsylvania Railroad, American Wood Preservers' Association, and various civic and social organizations.

From this it will be seen that the plan is not merely to give an exhibit on forestry, but also on its kindred subjects, in other words, to make the exhibition comprehensive as far as the field of forest products is concerned.

Most of the above named associations and organizations are planning some kind of an exhibit. The exhibition will not be on a commercial basis, but is given from a standpoint of education and instruction.

Besides the subjects set forth, there are a number of others which the Pennsylvania association is endeavoring to touch upon by means of exhibits, such as wood pulp, manufacture of paper, the various uses of sawdust, spraying and other apparatus, and by-products of the wood-working industry.

Hardwood Lumber Directory

The National Hardwood Lumber Association has just issued from its Chicago office the new Hardwood Lumber Directory, just off the press. The directory is volume sixteen and dated February, 1913. It contains

interesting data as to what the association has accomplished during the last six months, and what it expects to accomplish in the near future.

The character and working arrangement of the new reporting department are duly described in the directory. This is undoubtedly the most notable feature of the issue.

The directory also contains an official list of the membership to date, including the names of 102 new members who have joined since the annual meeting last June. This list shows not only the bulk gain of the association, but also how rapidly the association has gained favor in various important markets. Progress in Canada has been of an appreciable character.

Extensive Timber Deal in Wisconsin

An important timber deal was consummated last week between the Edward Hines Lumber Company of Chicago and the Atwood Lumber and Manufacturing Company of Park Falls, Wis. Through this deal the Edward Hines Lumber Company has become owner of what is probably the largest tract of standing timber held by one company in the state of Wisconsin. According to what are classed as conservative estimates, the stand includes 600,000,000 feet of timber. Of this, one-third is in counties east of Park Falls, while the remaining two-thirds are situated in the counties of Ashland, Iron, Rusk, Oneida and Sawyer. The concerns involved in this deal, besides the Edward Hines Lumber Company as purchaser and the Atwood Lumber and Manufacturing Company, are the Mississippi Logging Company and the Chippewa Log and Boom Company. The deal, besides timber, involves the Atwood sawmill and railway. April 1 is the date set for the transferral of the holdings. The Hines company will, after that date, immediately begin preparations for the operation of the mill at Park Falls. This mill has a capacity of from 175,000 to 200,000 feet daily and the Hines company is planning to run it at least eleven months out of the year. The mill at Park Falls will be stocked from the timber east of Park Falls and about one-half of that lying west of that point. The balance will be manufactured at the plant at Hayward, Wis.

Big Cypress Deal in Florida

On Feb. 12, J. C. Turner, head of the J. C. Turner Lumber Company of New York City, purchased 100,000 acres of high-grade cypress timber situated in Florida. James D. Lacey & Co. of Chicago acted as mediary through which the deal was consummated. This deal represents the transferral of the largest single body of standing cypress in the United States.

Messrs. Burton and Swartz of the Burton & Swartz Cypress Company, Burton, La., large operators in cypress, are associated with Mr. Turner in this deal. The purchase is in the nature of an investment as Mr. Turner and his associates are not planning to operate in the near future or until such time as their already extensive cypress holdings are cut out.

This purchase, together with a purchase consummated a short time before, as noted in the last issue of HARDWOOD RECORD, gives Mr. Turner the standing as the largest individual owner of cypress timber in the country. The two deals referred to were consummated after an extended trip through southern points on the part of the principal purchaser.

Building Conditions in an Ohio City

While the weather remains good and suitable for building at Cincinnati, O., still contractors hesitate to start work except in a few cases, preferring to wait a few weeks for weather to settle. The result of this inactivity among the building trades has been a light demand for millwork. Planing mills, however, have been very busy during the lull making up stock sizes for spring business, and will continue right along up to capacity, as the run on special work for current business continued so long last season that all plants were completely sold out and had little time to make up stock. They have done considerable more buying of this class of stock this year than for several years. There is every indication of a big year in the building field. The regular "home building" companies that build for the market are very active this year, and then there are one or two additions of subdivision operators who expect to operate on a large scale in this section.

In addition to this speculative building all architects are very busy and many contracts for good sized work have been let for an early start, with much more to follow. The general opinion is that there will be plenty of work for the millwork dealers this year. All of the popular finishes are to be used as usual, and yellow pine and cypress will be much in evidence. The demand for hardwoods is very strong even in the cheaper class of homes, which will result in much oak being used, but owing to the high price of this class of finish and the success that has been attained by the use of red gum for interior finish will make gum loom up stronger than ever before.

Lumbermen's Underwriting Bulletin

Bulletin No. 61, issued by the Lumbermen's Underwriting Alliance of Kansas City, Mo., analyzes the much talked of reports on the "arson trust," which it has been shown exists pretty much throughout the country. The bulletin points out a very striking difference between the methods pursued by the average stock company as contrasted to the methods of the Alliance. The remedy advocated by the municipal fire commissioner of New York City, in dealing with this question, is that the fire insurance companies should stop issuing policies without a pre-

vious inspection of the property upon which insurance is sought, and an investigation of the character of the owner.

On the other hand the Alliance creates for its subscribers no liability, except after an investigation of the character of the property and the owner.

After a close analysis of the question of the existence of an arson trust the bulletin suggests that as a matter of justice the public hold in abeyance its judgment as to the relation between the heads of the large stock companies and those directly connected with the business of arson.

The bulletin then says that lumbermen engaged in producing similar finished product from similar raw material have comparable fire risks. The risks of lumbermen as a whole are happily situated at a safe distance from the operations of the arson trust, and from the congested centers of great cities, constituting the conflagration hazard. They are not often exposed by close proximity of risks other than their own. The bulletin then raises the question as to why the lumberman should surrender the natural advantage of isolated location already theirs by joining with those less fortunately situated, and by contributing to the losses of others less careful than they, to the losses caused by criminal intent, to the losses caused by the necessary exposures of great centers and to vast conflagration, when the property of lumbermen is not subject to any of these hazards.

Every lumberman whose risk is situated as before described, and who is buying his insurance from public companies is not only contributing to the losses from causes just named, to which his plant is not subject, but is bearing his share of the overhead charges and expenses which stock companies seem to find it impossible to avoid. The fundamental cost of insurance is fire loss for which policies are liable. The only way that this first cost can be reduced is by preventing fires. The Lumbermen's Underwriting Alliance, as it is well known, is accomplishing toward this end more than has been done or is being done at present in any other way.

It would seem that insurance under the Alliance plan is at the lowest cost at which it can be produced other than by a still further reduction in fires. Last year, the eighth and best year of the operation of the Alliance, it saved fifty-eight per cent of its policyholders' earned premiums. This means fifty-eight per cent of the premiums of the Alliance figured at the Alliance rates, which would be a much larger per cent of the premiums figured on stock companies' rates when the Alliance entered the field.

The only fire of any consequence since December destroyed the sawmill and boiler house of the Alexandria Lumber Company at Alexandria, La., with a loss of about \$64,600. This was the first sawmill fire among the patrons of the Alliance in eight months, and the third in fifteen months. The loss ratio of all other plant divisions has also decreased in a marked degree.

The bulletin points out several lessons as gained from the Alexandria fire. The cleaning crew should be gotten into the mill as soon as possible after the departure of the day workmen. The mill should be equipped with plenty of full water barrels with buckets in or above them. The hose should be tested frequently, and should be already connected and muzzled, and of a size that the watchman can handle. Sand buckets should be supplied to smother insipient blazes from hot boxes. The cut-off valves should be located in the open, where it is easily accessible and plainly visible. It has been proven that outside hydrants fifty feet from the mill are too close to operate the hose from them without burning, and hence on being abandoned they tap the water pressure. Every plant should have at least two sources of steam supply.

Recent Mahogany Sales at Liverpool

There were representatives of numerous large companies present at the February sales of mahogany in Liverpool. The catalogues at these sales included a large percentage of inferior woods with the result that any good logs fully maintained reasonably high prices.

Advices from Liverpool are to the effect that there is no immediate prospect of any reduction in price, and the same advices suggest that buyers are not saving anything by holding back their orders and, in fact, would work to their own advantage by buying now.

Consumption of Railway Ties in Canada

In 1912 there were 7,341,649 railway ties consumed in Canada; the year before about 500,000 less, and in 1907 there were 5,200,000 ties consumed. The average cost per tie in 1912 was 44.7 cents; in 1911, 43.8 cents, and in 1907, 36.7 cents. This represents an increase of 2.15 per cent in the average cost of ties from 1907 to 1912.

Among the woods used are cedar, oak, burl, spruce, fir, tamarack, pine and chestnut. Tamarack was by far the leader, there being over 1,000,000 ties used made of this wood, while cedar, the next, shows only 875,000. Pine ranked next; oak, third; hemlock, fourth, and chestnut, fifth.

The oak tie is by far the most expensive tie used in Canada, pine being second; tamarack, third; cedar, fourth; according to the report.

The Fork of a Tree Never Grows Higher

Some people through careless observation believe that the fork of a forest tree will gradually grow higher from the ground. If they would investigate it would be found that the forks and "heads" of fruit trees are at exactly the same point where they were when first noted. The state

forester in inspecting locust and catalpa groves throughout the state has found owners who have not removed one part of the fork of those trees that have formed forks below fence post length, believing that in years the fork would grow up and a fence post could be cut below the fork. This erroneous belief is the cause of much of the delay and neglect of pruning in early life of street and roadside trees.

It should be remembered that the base of a fork or a branch of a tree will always remain at the same distance above the ground. The side branches of some trees, such as the elm, usually continue to grow upward, while those of other trees such as the maples incline upward when young and as the tree grows older the weight of the branches gradually brings it to the horizontal. The latter often makes the removal of large branches necessary, which not only spoils the symmetry of the tree but usually starts decay which soon kills the tree.

No street or roadside tree should be permitted to form a fork below ten feet and all of the side branches to the same height should be removed so that they will shade the adjacent crop less. If this is done the tree in time will grow a saw log below the branches. Every farmer who has a tree growing along his fence should see to it that it is properly pruned before springtime comes. A book on the planting, care and pruning of street and roadside trees may be obtained free by writing to the state forester at Indianapolis.

A woodlot of thirty-five acres, five acres of which had at one time been partially cleared, was recently visited because of this popular idea. Over the cleared area many walnut trees came up, which now average from three to six inches in diameter. However, the trees are not close enough for natural pruning to be operative and as a result the trees have headed very low and a majority below seven feet. The owner has held the tract for thirteen years hoping to grow a walnut forest. His trees are too far apart for natural pruning and too old for artificial pruning and he is forced to abandon a cherished idea because he thought the "tops" of the trees would gradually grow up.

There are many who share with this man the same idea and the publication of this bulletin will do much good.

Returns to St. Louis

The R. M. Morris Lumber Company is the style of a new corporation at St. Louis, Mo. This corporation is a culmination of a number of changes affecting the affairs of the former Morris Lumber Company of St. Louis.

Sometime ago this firm moved to Chicago, but it has now discontinued the connection which brought it North, and has returned to its former location.

R. M. Morris is president of the company, which will handle hardwood and yellow pine. The offices are on the fourth floor of the Wright building. The R. M. Morris Lumber Company will handle the stock of the Triangle Lumber Company, Clio, Ark.; the Sterling Lumber Company of Bastrop, La., and J. H. Allen & Co., Minter City, Miss.

J. D. Serogim was engaged on Mar. 5 as the Chicago representative of the R. M. Morris Lumber Company.

Hardwood News Notes

< MISCELLANEOUS >

E. W. Sparrow, president of the Lansing Company, Lansing, Mich., died recently.

The Advance Lumber Company, Cleveland, O., has increased its capital stock from \$131,350 to \$500,000.

The Arkansas & Indiana Lumber Company of Clarksville, Ark., has opened a lumber yard at Ozark, Ark.

The Below Lumber Company has been incorporated at Mansfield, Wis., with an authorized capital of \$10,000.

A new incorporation at Gregory, Miss., is the Attalla Lumber Company, with a capital stock of \$75,000.

The King-Singer Company has been incorporated at Washington, D. C., with a capital stock of \$50,000. The company will manufacture furniture.

The plant of the Kansas City Hardwood Flooring Company, Kansas City, Kans., was damaged by fire, February 23, the loss being estimated at \$45,000.

The J. J. White Lumber Company has commenced operations at its new mill in Columbia, La., which is understood to represent an investment of \$165,000.

The Standard Lumber Company has been organized at Louisville, Ala., by A. J. Rombach and G. D. Goodwin of Columbus, Ala., and D. G. Holcomb, Jr., of Louisville.

Curtis Bros. & Co., manufacturers of sash, doors and blinds, Clinton, Ia., contemplate the erection of a large modern factory to take the place of the present structure.

A new furniture manufacturing enterprise has been organized at Chicago styled the Merchants' Furniture Company, by George W. Wilbur, Samuel E. Dale and LeGrand W. Perce.

It is announced from Escanaba, Mich., that the new factory of the Bird's-Eye Veneer Company, recently incorporated at that place, will be ready for occupancy by the first of April.

The Concordia Land & Lumber Company at Jeffris, La., started operations on Mar. 1, after being idle for several weeks. The plant was shut down on account of poor logging conditions.

The Burgaw Lumber Company, Inc., has been incorporated at Norfolk, Va., the officers being: W. R. Tolleth, president; J. M. Marshall, vice-president; R. M. Brown, secretary and treasurer, all of Norfolk.

The D. W. Atchison Lumber Company has been formed at Chattanooga, Tenn., with a capital of \$10,000, those connected with the enterprise being A. P. Conklin, D. W. Atchison, Paul Campbell, C. S. Coffey and R. A. Cogswell.

The Wabash Hardwood Company of Terre Haute, Ind., and Memphis, Tenn., extensive hardwood dealer and exporter of timber and lumber, has established a branch office in Beaumont, with L. L. Boone, Jr., as its representative there.

The Straight Creek Lumber Company has been organized at Barbourville, Ky., and has purchased the standing timber in Bell and other southeastern Kentucky counties from the Continental Coal Company. It is estimated that ten years will be required to get off the timber.

The factory and machinery of the Mergenthaler-Hortons Basket Company of Paducah, Ky., was recently purchased by the Lucas Land & Lumber Company of that place, the consideration involved being about \$50,000. The purchase was made by the Lucas company with the idea of providing facilities for the manufacture of boxes from its low-grade lumber. It is well equipped and well located. The capacity of this plant is about five times that of the Lucas box plant which was destroyed by fire last December.

CHICAGO

J. O. Wetherbee of the J. O. Wetherbee Company, Boston, Mass., was a Chicago visitor, Mar. 10.

The Union Show Case Company, of Chicago, Ill., recently filed an involuntary petition in bankruptcy.

M. J. Fox, manager of the Von Platen Lumber Company's operations at Iron Mountain, Mich., was in Chicago several days of last week.

Harry Schadt, secretary of the Hyde Lumber Company of South Bend, Ind., spent several days of last week in Chicago.

Ralph May of May Brothers, Memphis, Tenn., spent several days with the local trade about a week ago.

J. T. Edwards, manager of the Medford Veneer Company, Medford, Wis., was in Chicago in conference with his local representatives a week ago.

H. D. Leavitt, vice-president of the Oconto Company and manager of its operations at Oconto, Wis., spent a few days of last week in this city in conference with the local office.

The Lumbermen's Club of Chicago gave a highly successful stag and smoker in the club rooms on Friday evening, Feb. 28.

J. C. Turner of the J. C. Turner Lumber Company, New York City, accompanied by his wife, reached Chicago on Feb. 26, having come from French Lick, Ind.

HARDWOOD RECORD has just been advised that the Gaylord Motor Car Company has closed a contract with the Michigan Hardwood Manufacturers' Association, for a car of special design for the use of the chief of the forest fire protective department, Charles F. Hickok.

NEW YORK

The southern railway and steamship lines have announced that, effective March 11, they will eliminate free lighterage within the New York lighterage limits. This will amount to about \$1.25 per M on shipments from Southern Pacific milling points.

Charles W. Booth, for many years identified with the domestic and foreign hardwood trade, died at Bayonne, N. J., Feb. 22 of heart disease. Mr. Booth was a member of the firm of Wm. Booth & Bro. of Manhattan. He is survived by a widow and three children.

The C. C. Mengel & Brother Company has opened a sales office in the Aeolian building, West Forty-second street, Manhattan. S. C. Strock will be in charge. This company is one of the foremost importers and exploiters of mahogany in the world.

Charles Milne of the Milne Brothers Company, wholesale hardwood specialist, 18 Broadway, left for Washington with the Essex Troop, New Jersey, which appeared in the inaugural parade.

G. J. Howie of Wright, Graham & Co., Glasgow, Scotland, who has been spending some time at hardwood manufacturing points in the States, sailed for home during the past fortnight.

E. L. Edwards of the Edwards Lumber Company, Cincinnati and Dayton, O., sailed from New York Feb. 27 on the steamer "France" of the French line for a brief trip to Paris.

Gustave A. Farber, London representative of Russe & Burgess, Inc., hardwood manufacturers and exporters of Memphis, sailed for home last week.

W. S. Harlan of the Jackson Lumber Company, Lockhart, Ala., returned home after a few days spent in town visiting the local representative. Mr. Harlan was optimistic over the business outlook.

T. Thompson has opened an office in the Aeolian building and will conduct a wholesale mahogany import business.

A. B. Ransom of Nashville, Tenn., spent a couple of weeks in town re-

cently. Mr. Ransom finds hardwood conditions generally strong with firm prices and a scarcity of good grades.

The American Veneer Company, formerly at Kenilworth, N. J., is again doing business at a new location in Hoboken, N. J. The new plant is of much larger capacity and facilities for handling business are vastly increased. The company has acquired the plant and taken over the business of Joel H. Woodman.

The Emporium Lumber Company interests have organized the Emporium Forestry Company, a New York corporation which is now owner of 86,000 acres of land in New York state and mills and railroad operations formerly owned by the Emporium Lumber Company. The stockholders and officers of the Emporium Forestry Company are practically the same as of the Emporium Lumber Company. The lumber products of the Emporium Forestry Company will be marketed by the Emporium Lumber Company. The operations of the Emporium Lumber Company at Keating Summit and Austin, Pa., are expected to be completed this spring and the offices of the company will be moved to Utica, N. Y., which will be closer to the operation at Galeton, Pa., and more convenient to the principal trade of the company.

BUFFALO

On May 1 the headquarters of the Emporium Lumber Company will be at Utica, N. Y., with the Buffalo office reduced in size and some of the Pennsylvania offices discontinued. President W. L. Sykes has not decided whether or not he will remove to Utica this spring. Utica was selected because it is a sort of half-way point between the mills of the company in the Adirondacks and Vermont on the one side, and Austin and Galeton, Pa., on the other.

The Buffalo dealers who are in Michigan and Wisconsin hardwood trade are finding prices very high this winter, and they would go elsewhere for supplies if they know where to find them. There is now no hardwood coming out of Canada, so that everything has to come from the South or the Southwest, if the lake district will not produce it at paying prices. Of course New York, Pennsylvania and New England are doing considerable in hardwoods.

The Setter Brothers Company, a lumber and veneer manufacturing plant of Cattaraugus, has entered into an arrangement to move the business to Jamestown, and it is expected that the business will become part of a new \$100,000 corporation being formed to manufacture furniture veneers. The name of the new plant and its location are not yet disclosed.

F. M. Sullivan reports excellent winter trade at the Arthur street yard, much of it in soft gray elm and brown ash. Stocks of oak and maple are also being replenished.

A. J. Chestnut has returned from a short trip to Florida. He reports that Jacksonville impressed him as favorably as any other town he visited, but he thinks that the North is the section to live in.

Hugh McLean left for the southern mills of his company early this month, planning to be away for three weeks and to spend some days in Florida before coming home.

Anthony Miller finds the hardwood trade very fair for March, although the presence of much snow makes it difficult for his men to handle all the incoming lumber now arriving.

I. N. Stewart & Bro. have been moving a good amount of oak and poplar this month and are looking to see the present good inquiry for hardwoods still more improved soon.

Horace F. Taylor of Taylor & Crate, Inc., is going South right away to look after the interests of the company beyond the Ohio. The office reports business as never better. The new yard will be developed slowly as soon as the weather permits and will have a fireproof office building.

O. E. Yeager and J. B. Wall left early this month for a trip to Mt. Clemens, where they will spend about two weeks. Mr. Wall has been appointed a member of the finance committee of the International Congress of School Hygiene, which will be held in this city in August.

F. T. Sullivan has returned from a business trip to New York and Philadelphia and is now busily engaged in making plans for lake shipments this summer to the local yard of H. H. Salmon & Co.

M. M. Wall and W. L. Sykes were among the Buffalo lumbermen who took in the inauguration of Woodrow Wilson. They also attended the wholesalers' convention at Atlantic City.

At the annual election of the Buffalo Lumber Exchange held Mar. 8, A. W. Kreinhedor was elected president, John McLeod vice-president, and John S. Tyler secretary and treasurer, with the following board of directors: H. L. Abbott, W. P. Betts, John F. Knox, Anthony Miller, W. A. Perrin, James N. Scatcherd, John S. Tyler, A. W. Kreinhedor, J. M. Briggs, Peter McNeil and John McLeod. Satisfactory reports were made by the secretary and treasurer.

PHILADELPHIA

Daniel B. Curl testifies to progressive trading with inquiries multiplying. Unfortunately he is obliged to turn down orders for some of the woods unusually scarce at this time. His four portable mills near Butler, Tenn., and the one at Fort Blackmar, Va., are rushed to the limit getting out hardwoods and hemlock.

The W. R. Taylor Lumber Company reports business increasing right along. W. R. Taylor, who is at present on a business trip through New York and New Jersey, will return in a few days before making an ex-

tensive trip through the southern lumber camps as far as Florida.

Lukens Brothers, who were among the oldest and best-known retailers of this city, have disposed of their yard and joined the ranks of wholesalers, with office at SOS Perry building.

W. J. Mings of Mings & Rutter reports unlimited business with promise good for rest of the year. The only trouble is where to look for the goods.

J. E. Troth, president of the J. S. Kent Company, says the month of February is regarded as between seasons, and a slight lull in trading is nothing unusual, but things are moving along nicely and orders can be booked for almost anything that can be promptly delivered.

Ralph Souder of Hollowell & Souder reports a satisfactory business. They are not forcing their salesmen at this time as they wish to catch up with the shipping of accumulated orders. The outlook is very encouraging.

W. A. Jackson of the Jackson-Wyatt Lumber Company recently returned from a stock hunt in North and South Carolina. W. H. Wyatt is there now on the same errand. "There is no trouble booking sales," he says, "the gathering of material is where the hitch comes."

The Baldwin Locomotive Works recently booked an order from the Baltimore & Ohio Railroad for ninety locomotives, costing \$2,325,000; also an order for five engines from the Missouri Pacific Railroad.

The Pine Tree Lumber Company, Sunbury, Pa., capitalized at \$5,000, was incorporated under Pennsylvania laws, Feb. 20.

The East Falls Lumber Company, this city, obtained a charter under Pennsylvania laws, Feb. 20, with a capital of \$10,000.

The Warren Table Works, Warren, Pa., was chartered under Pennsylvania laws, Feb. 21. Capitalized at \$175,000.

← PITTSBURGH →

J. N. Wollett, president of the Aberdeen Lumber Company, made a very successful buying trip to the Southwest lately and got under way a large amount of cottonwood and gum which he sent up the river by barge. Two of these barges were unloaded last week at Louisville and another one will be distributed from a Mississippi river town shortly.

The Manufacturers' Lumber Company is a new concern here organized by A. E. Murphy, well known in lumber circles in Pittsburgh, and C. M. Lomery and E. J. Flautt. The company will have offices in this city.

The Pittsburgh Industrial Development Commission last week landed its fourteenth plant in fourteen months for Greater Pittsburgh. This was the Fulton Iron Company, which has secured a four acre site at Cheswick, a few miles up the Allegheny river. It will employ 150 men.

The West Virginia Lumber Company reports business good and prospects fine. It is doing a splendid business this year in making boats and barges for the coal trade at its plant in northern Pennsylvania.

The Woodlawn Lumber Company is a new concern at Woodlawn, fifteen miles down the Ohio river, where the \$10,000,000 plant of the Jones & Laughlin Steel Company is located. Its members are John F. Haines, E. M. Ridenour and W. J. Harris.

J. W. Semans and Thomas B. Palmer, Uniontown, Pa., have bought 2,200 acres of timberland in Somerset and Westmoreland counties, Pa., for about \$80,000. The work of cutting will start shortly. Most of the lumber will be hardwood.

Joseph J. Linehan is busy these days marketing the stocks of the Mowbray & Robinson Company of Cincinnati and reports from his office in the Fulton building that plenty of good business is in sight.

The Pittsburgh Wood Preserving Company is arranging to build another plant at Reed City, Mich., for the treatment of ties. It already has two plants near Conneville, Pa., and Orrville, Ohio.

C. E. Breitwieser & Co. report their hardwood business first class. Frank Smith of this concern was in West Virginia last week making new connections for lumber.

President W. D. Johnston of the American Lumber & Manufacturing Company went to the western coast last week on a business trip. Mr. Johnston recently returned from a trip to the Bermudas. He thinks that business prospects in lumber circles are very encouraging.

← BOSTON →

Frank F. Carpenter, president of the Frank F. Carpenter Lumber Company, Providence R. I., died late in February in that city after an illness extending over three years. He was confined to his bed about four weeks. He was fifty-eight years of age. Mr. Carpenter had been in the lumber business since leaving school. He entered business for himself about four years ago. He is survived by a widow.

The National Woodworking Machinery Company, of Manchester, N. H., is reported to have been taken over by Joel F. Sheppard of Dover, N. H., who will remove the business to the latter city.

Recent visitors to this market were:

G. F. Stocker, representing the J. J. Newman Lumber Company, Scranton, Pa.; C. H. Carroll, representing the Robinson-Edwards Lumber Company of Burlington, Vt.; C. R. Gardiner, of the A. J. Chestnut Lumber Company, Buffalo, N. Y.; A. L. Underwood, second vice-president of the J. C. Turner Lumber Company, New York; L. C. Litchfield, representing the Montgomery Lumber Company, New York; and Edwin D. Walker, treasurer of the John M. Woods Lumber Company, Memphis, Tenn.

The Fletcher Lumber Company, Springfield, Mass., has been incorporated

with a capital stock of \$25,000. The incorporators are George W. Stone, William A. Fletcher and Frank A. Braford.

The Sebago Lumber Company, Portland, has been incorporated with a capital stock of \$10,000. The incorporators are Robert B. Jordan, Scarborough, Me.; Sidney St. F. Thaxter and Roseoe Holt, of Portland.

← BALTIMORE →

The annual meeting of John H. Heald & Co., Inc., Lynchburg, Va., manufacturers of tanning extracts and coloring matter from chestnut and other woods, was held there the last week in February, the following officers being re-elected: President, Charles E. Heald; vice-president, John M. D. Heald of Baltimore; secretary, Charles E. Heald, and treasurer, H. T. Thornhill. The factory of the corporation uses about fifteen cars of chestnut a day, consuming also chestnut oak, black oak and Spanish oak. The yearly reports read at the meeting showed the company to have been very successful. J. M. D. Heald is of the firm of Price & Heald, the hardwood wholesalers and exporters here.

Among the visiting lumbermen in Baltimore recently were J. S. Kent of the J. S. Kent Company of Philadelphia; H. E. Santord of Sanford & Treadway, New Haven; Mr. Morrison of the Boice Lumber Company, Inc., of Richmond, Va., and C. L. Shoffner, general manager of the Shoffner Lumber Company of Cleveland, O. Messrs. Kent and Sanford were on their way home from the mills of their respective companies in the South, and stated that the plants had plenty of orders on hand and were facing a most promising prospect. Similar reports about trade conditions were made by the other two visitors.

Baltimore is to have a \$1,000,000 belting factory, the American Belting Company of this city having been incorporated on Feb. 28 at Dover, Del., with a capital stock of that amount, subscribed largely here. The incorporators named are Harry C. Lawrence, 2347 Eastern avenue, secretary of the Maryland Belting and Packing Company; William M. Purdy, a machinist living at 1006 Federal street, and Charles T. Neepier of Catonsville, a suburb. It is stated that Baltimore will soon have the largest factory for the manufacture of stitched canvas and cotton duck belting in the world. The plant will cover from three to five acres and employ 500 persons. The Maryland company is to be merged with the new corporation, it is stated.

← COLUMBUS →

The most important happening in lumber circles in the past few weeks was the passage by the Ohio General Assembly of the Green compulsory workmen's compensation bill. The bill provides that every individual, firm or corporation which employs five or more people must pay into the state premiums which are to be used for disability and death of employees. The schedule of benefits for death range from \$1,500 to \$3,500; for temporary disability two-thirds of the average weekly wages is to be paid, provided it does not exceed twelve dollars, for a period of six weeks. For permanent disability the employe is paid two-thirds of his weekly wages for life, provided it does not exceed twelve dollars per week. Many lumbermen objected to the compulsory bill, but since it does not become effective until January, 1914, sufficient time will be given to work out the details.

The Collinwood Lumber Company of Collinwood, O., has filed papers with the secretary of state increasing its capital stock from \$20,000 to \$40,000.

Papers have been filed with the secretary of state decreasing the capital stock of the Compressed Wood Preserving Company of Cincinnati, O., from \$200,000 to \$50,600.

After a short illness in which his serious condition was not realized, Fred W. Hubbar, secretary of the Kilbourne & Jacobs Manufacturing Company of Columbus died at his late residence, 447 East Broad street, of blood poisoning. He was also president of the Sun Manufacturing Company of Columbus. He comes from one of the oldest families of central Ohio and was well known in business circles. He was fifty years of age and is survived by a widow, four children, mother and a large circle of friends.

The Atlas Cooperage Company of Fremont, O., has moved to Fostoria, O., and will start operations in the new plant March 20. Ralph Morris is superintendent of the concern.

R. W. Horton, sales manager for the central division of the W. M. Ritter Lumber Company, says the hardwood trade is strong in every way. Both factories and yards are buying well. Yard stocks are slightly larger in preparation for the spring building trade. Factories are buying only what is needed for immediate consumption. Prices are firm and inclined to advance. Dry stocks in every locality are generally short. Mr. Horton recently returned from a business trip to Rochester, Syracuse and New York City.

J. A. Ford of the Imperial Lumber Company reports a good demand for hardwoods with stocks growing scarcer. Prices are well maintained. Mr. Ford recently returned from a business trip in the lumber districts of West Virginia.

Manager Hoddl of the Virginia Lumber Company says trade is good, especially in the lower grades of hardwoods. He believes that the activity will continue in all branches of the trade. Mr. Hoddl recently returned from a business trip in northern Ohio.

John R. Goby of John R. Goby & Co., says trade has been fair and prices are strong; buyers apparently are waiting on the weather, although

no weakness is apparent. Retail stocks are slightly increasing.

Secretary Benbow of the Sowers-Leach Lumber Company says there is a fair trade, especially in northeastern Ohio. Prices are holding up well and his company reports a fifty per cent gain in orders so far this year over last year.

W. B. Sissons, sales manager for the Sowers-Leach Lumber Company, recently returned from a business trip in the South.

F. Everson Powell of the Powell Lumber Company says there is a fair volume of business in the hardwoods. Prices are high and are expected to continue so.

◀ TOLEDO ▶

"Business continues good with us and we have all the orders we can well take care of," was the report of the Toledo Carriage Woodwork Company.

"We already have on our books all the orders we will be able to take care of this year," said Manager Roberts of the Big Four Hardwood Company, speaking of the piano case manufacturing end of the business.

The J. M. Skinner Bending Company is building an addition to its plant at the intersection of Broadway and the Wabash railroad. The new building will be fifty-five feet in length and twenty-five feet wide and will cost about \$2,500. This concern is one of the oldest manufacturing plants in the city and the new addition will be used as a wheelbarrow manufacturing plant.

The Yesbera Manufacturing Company is running full time and capacity turning out store fixtures. This concern says that, judging from inquiries which are flooding in from all portions of the country, it is entering onto the biggest year of its history.

Many investment structures and additions to factories are now in the course of construction or in the hands of architects, ranging from twenty-one-story office buildings to two-flat and residence structures. Last year was the banner building year for Toledo and the coming season will leave it far in the rear if inquiries and plans are to be trusted. Toledo is to have a civic center the coming summer which will mean the expenditure of practically a million dollars.

◀ INDIANAPOLIS ▶

W. W. Knight, president of the Long-Knight Lumber Company, and Mrs. Knight are in Atlantic City.

John J. Madden of Thomas Madden Son & Co. has bought a manufacturing plant and will engage in the manufacture of a line of furniture.

Millwork is to be manufactured by the Builders' Mill Work Company, organized and incorporated at Laporte with an authorized capitalization of \$15,000. Those interested in the company are Charles O. Larsen, Frank A. Larson, Emil Danielson and G. Edward Caul.

Building operations in the city during February embraced 311 permits aggregating \$479,653 as compared with 136 permits aggregating \$82,040 issued in February, 1912. Last month's operations established a new record for February.

An offer of \$307,000 for the plant and business of the T. B. Laycock Manufacturing Company, bed manufacturer, has been submitted by the general creditors to the receiver of the company. The court has taken the offer under advisement.

The Crawfordsville Furniture and Lumber Company has been organized at Crawfordsville to conduct a hardwood and furniture manufacturing business. It has been incorporated with an authorized capitalization of \$75,000 by Edward A. Sterzik, Frank C. Evans, Howard Smith, Preston O. Rudy, Henry E. Greene and Lawrence E. Devor.

The Indiana legislature has passed a public utilities law, said to compare favorably with the Wisconsin measure. It also has under consideration a workmen's compensation bill and a bill prohibiting women working more than nine hours in any one day or to exceed fifty hours in any one week.

◀ MEMPHIS ▶

The Bellgrade Lumber Company is making arrangements for developing its timber resources at Isola, Miss. It is building a tram road and mill shed. This is being done so that, when the remainder of its timber at Belzoni has been cut it may remove its machinery and logging equipment and install this without loss of time. The company owns 3,500 acres of timberlands near Isola. It has several million feet of timber to cut at Belzoni and this will be worked up as rapidly as possible. The company has its headquarters in Memphis. John M. Cathey is president and J. W. McClure is vice-president and general manager.

The Green River Lumber Company has purchased the timberland holdings of the Anderson-Thilly Company, near Democrat, Ark., amounting to about 5,600 acres. The company proposes to take immediate steps for the development of the timber on this property and to put the land in cultivation as rapidly as the timber is removed therefrom. Democrat is located on the Marianna cut-off of the Iron Mountain system and it will be necessary for the company to build a road from this line to the land in question. The timber is to be brought to Memphis, where it will be manufactured into lumber by the Green River Lumber Company.

Harry T. Darr, associated for some years with the Interstate Commerce Commission at Washington, has been chosen as assistant secretary of the Southern Hardwood Traffic Bureau, which was recently organized here

and which is handling all of the contests scheduled before the Interstate Commerce Commission affecting shippers in the southern territory. Mr. Darr, through his position, becomes the right-hand man of J. H. Townsend, general manager of the Southern Hardwood Traffic Bureau.

The D. J. Landers Lumber Company, which has fifteen lumber sheds between Springfield, Mo., and Imboden, Ark., has made preparation for opening yards at Hloxie, Ark. The yard at Imboden was opened only a few days ago.

Russe & Burgess Inc. have filed application for an amendment to their charter through which it is sought to increase the capital stock from \$150,000 to \$175,000. The application is signed by the principal stock holders of the company, including W. H. Russe and George D. Burgess. The company is preparing to make extensive improvements at its plant in North Memphis, full details regarding which will be furnished at an early date.

The insurance question, as affecting lumber risks in Memphis, is still far from definite settlement. The conferences which have been held between the law and insurance committee of the Lumbermen's Club of Memphis and T. L. Leatherwood of the Tennessee Inspection Bureau have not resulted in anything tangible. The propositions so far made by the latter have not been acceptable to the lumbermen, who intimate that it will be necessary for him to change the terms materially before the plans outlined by him will be acceptable to them. In the meantime the lumbermen are placing a considerable portion of their insurance with companies not identified with the board of underwriters.

The Attalla Lumber Company, Starkville, Miss., has filed application for a charter under the laws of that state. D. W. Baird of Chicago and W. F. Clary and W. T. Pride of Memphis are among the principal incorporators.

Among the prominent visitors to Memphis recently has been W. B. Sissons of the Sowers-Leach Lumber Company, Columbus, O. Mr. Sissons was here in connection with plans for the opening of a distributing agency or the establishment of a mill at this point. He said that he had been attracted to this city by virtue of advertising done by the Business Men's Club. He left Memphis for Turrell, Ark., without giving any definite idea as to what the company would do in regard to the proposition.

The contract is to be let at once for the building of the shop of the Missouri & North Arkansas railroad, at Harrison, Ark. The estimated cost is approximately \$100,000. The Missouri & North Arkansas is materially increasing its equipment and is likewise preparing, under the receivership, to build a number of tracks to timber and other resources, which will prove valuable feeders to the main line.

The Mississippi river at Memphis is again rising but lumber interests are of the opinion that there is nothing to be feared in the way of another flood. It is predicted that the stage will go to some twenty-five feet, which is ten feet below the danger line and some fifteen feet below the stage reached here a short time ago.

Preparations are being made for the rushing of work on the repair of the levee at Beulah, Miss. A branch line has already been built by the Yazoo & Mississippi Valley railroad for the handling of the necessary material and work on the filling of the crevasse is to be undertaken at once. In the opinion of those in close touch with conditions there, it is certain that the crevasse can be completely repaired before danger can occur from any rise in the Mississippi.

The Stout Lumber Company has resumed operations at Thornton, Ark. This company closed down its plant Nov. 10. During the suspension many improvements and additions were made, the present capacity of the plant being 130,000 feet of lumber per day.

The Three States Lumber Company and Lee Wilson & Co., both of which own extensive timberland holdings in Mississippi county, Ark., are named as defendants in a suit which has been instituted by the United States government, covering unsurveyed lands in that section. There have been a number of these suits filed in the past but particular interest attaches to the present one because of the prominence of the defendants named and also because of the value of the lands in litigation.

Ralph May of May Brothers has returned from a business trip to Chicago. Mr. May says that the outlook is quite satisfactory and that, in his opinion, there will be plenty of business to keep all the hardwood lumbermen quite fully engaged for the next six months. He also comments on the very decided scarcity of plain oak.

◀ NASHVILLE ▶

Lumber manufacturers and others are greatly interested in a bill that has been introduced into the Tennessee legislature which will do away with the old common law "fellow servants" doctrine, and greatly broaden the scope of liability of employers to damages for personal injuries. The legislature has taken a recess until Mar. 17, and in the meantime manufacturers all over the state are organizing a campaign to defeat the bill, which is backed by the labor unions. Lumbermen are preparing to have a bill introduced into the legislature for the conservation of forests, and will seek to get appropriations for making this department more effective in Tennessee.

During the month of February building permits issued in Nashville called for improvements amounting to \$155,760, against \$71,000 for the same month of 1912.

Receipts of logs from the upper Cumberland river territory, brought down by the recent high tide, have materially increased the stocks of raw

material of local concerns. It is estimated that about 5,000,000 feet of oak, poplar, chestnut, hickory, walnut and other hardwoods have arrived from the upper river country.

The death of Robin Orr, aged ninety-one years, one of the oldest citizens living near Lynnville, Tenn., has resulted in some magnificent oak, walnut, hickory and poplar on his farm being placed on the market. So long as the venerable citizen lived he would not allow the ax to be placed to the magnificent trees on his place, and they were long admired by his neighbors.

The saw and planing mills of Sid Farmer, twelve miles from Dresden, Tenn., were blown up with dynamite by unknown miscreants, while Mr. Farmer was in Mississippi. A loss of \$4,500 resulted, and Mr. Farmer had no insurance.

The many friends of Charles M. Morford, a prominent lumber manufacturer, were greatly gratified at his election as president of the Nashville Manufacturers' Association. The Manufacturers' association started an important movement to bring all of the commercial organizations of Nashville, more than one dozen in number, together into one big building. The Nashville Lumbermen's Club is included in the number. If the movement is successful it will be the biggest thing ever attempted in Nashville in the way of commercial organization, as many millions of dollars of capital will be represented by such an amalgamation.

The Tennessee Timber, Coal & Iron Company, which owns 65,000 acres of timberland in Morgan, Cumberland and Fentress counties, has perfected its plant four miles from Nemo, a station on the Queen & Crescent railroad, and will soon be turning out 75,000 feet of lumber daily. The company is composed of Boston capitalists, and will have offices at Cartoosa, Tenn. It is said that the company has an investment of about \$1,000,000.

The Cahaba River Lumber Company has been organized at Brent, Ala., by Thomas Goodall of Nashville, and others. The company contemplates putting in a circular mill, with daily capacity of 15,000 feet of lumber. The company owns about 3,500 acres, including largely oak and poplar timber.

← LOUISVILLE →

If the plans of C. C. Mengel & Bro. Company are carried out as indicated, Louisville will have probably the largest mahogany sawmill in the country. The company, as recently reported, has increased its capitalization by \$1,800,000, and the sale of this stock will enable it to expand its business enormously. It is definitely determined to build a new and much larger mill, while the facilities of the company for storing and handling lumber will also be enlarged. The concern has a site of over 100 acres in South Louisville and so has plenty of room in which to expand. The veneer mill may also be increased, but plans in regard to this have not been elaborated. Clarence R. Mengel, president of the company, believes that the present boom in mahogany is a permanent condition, and that the demand for the aristocrat of hardwoods will continue large indefinitely. Hence the company has every confidence in the advisability of making permanent betterments on a large scale.

The Edward L. Davis Lumber Company has been going over its local sawmill and getting things in shape for a heavy run during 1913. Members of the company are much pleased with the demand for quartered oak, in which the concern specializes, and report that the furniture factories and other important branches of the consuming trade are calling for more quartered oak than in some time. J. E. Davis, vice-president, is now on the road in the interests of the company, handling the buying of both logs and lumber.

The Booker-Cecil Company, one of the youngest and also one of the most bustling and successful of local hardwood concerns, has recently added a Hupmobile touring car to its equipment. The auto will assist in calling on the local trade. P. G. Booker, who does most of the buying for the company, has returned from a trip through central Tennessee.

D. E. Kline of the Louisville Veneer Mills is enthusiastic over the condition of business, reporting the demand for both veneers and panels to be well up to expectations and in fact above normal. The company has been pushing its figured gum panels aggressively, and is booking enough business to indicate that it is delivering the goods in fine style.

The Louisville & Nashville is now enforcing its tariff relative to milling-in-transit. The tariff is not exactly in accord with the most recent opinion of the Interstate Commerce Commission, which provides that hardwoods may be substituted for hardwoods, and not necessarily oak for oak, hickory for hickory, etc. As the general substitution will solve the problems incident to handling mixed cars of logs and lumber, the lumbermen are very anxious to have the Louisville & Nashville amend its tariff, which doubtless it will do in the near future. The Illinois Central and Southern railways will probably adhere to their original methods on the subject.

J. E. Barton, state forester, has been active of late in informing the public of the work of the forestry department. He addressed the state farmers' institute at Paducah recently, referring to the danger of fire, which he said the department will do its best to prevent. He declared that Kentucky is the natural center of the hardwood production by reason of the variety of its woods and the location of the state. He believes that the law under which the department is operating is practically ideal. He spoke before the Women's Outdoor Art League in Louisville this week. The state board of forestry has about completed plans for the establishment of a reserve in the mountains of eastern Kentucky,

and will announce the territory which has been secured in a few weeks. A tract of land near Frankfort has been secured for nursery purposes, and will be used in addition to a similar plot which is located adjoining the state fair grounds in Louisville.

Lumbermen who are anxious to have the Louisville & Nashville adopt a reasonable attitude in regard to switching, and who are supporting the Board of Trade in its action before the Interstate Commerce Commission looking to the forcible interchange of switching facilities, have been encouraged by the fact that the commission has ruled favorably to the shippers on a similar case, coming up from Baltimore. Consequently it is believed that an opinion will be handed down in which the Louisville & Nashville will be compelled for a reasonable charge to accept switching on cars originating at competitive points.

Favorable tides are running in the tributaries of the Kentucky river and a large quantity of logs and rafts are coming out. This means that mills in that part of the state will get an early start on their season's sawing.

The Southern Lumber & Boom Company at Valley View, Ky., has sold its mill at that point to Milliken & Aldrich, who, it is reported, will remove the equipment to Irvine, further up the river.

The sawmill formerly operated by the Washington Mining & Manufacturing Company at Park's Ferry, Ky., has been sold to W. F. Clark and will be put in operation. Dr. G. E. Martin, who bought the property at a bankrupt sale, will retain control of the planing-mill.

← ST. LOUIS →

Building permits showed quite a gain during February this year over those during the corresponding month last year.

Receipts and shipments of lumber at St. Louis during the month of February showed an increase over the corresponding month last year, according to the report of the Merchants Exchange. Receipts by rail this year were 17,757 cars, showing an increase over last year of 4,028 cars, when 13,729 cars came in. Shipments this year were 11,219 cars, a gain over last year of 1,989 cars, when 9,230 cars were shipped.

The stockholders of the Wm. G. Frye Manufacturing Company have asked for a dissolution of the company. The corporation has not been in active operation since July, 1911, when its storehouse was burned down.

W. W. Dings, secretary of the Garetson-Greason Lumber Company, who has been out on the Pacific coast on a selling trip, returned home a few days ago, but did not tarry here long, leaving after two or three days for Texas on another selling trip.

E. W. Blumer, sales manager of the Lothman Cypress Company, is out on a selling trip but is expected home in a few days.

Many important matters came up at the weekly meeting of the board of directors of the Lumbermen's Club, held a few days ago. Bettering the club and making it the best of any of the lumbermen's clubs in the country is the ambition of President Thos. C. Whitmarsh, and most of the suggestions which have been offered and are now being carried out, came from him. The new propositions are to extend invitations to the members of every lumbermen's club in the country, to make their headquarters in the rooms of the local club when they come to St. Louis. Desks and writing material will be placed at their disposal and they can write their letters, meet friends and make themselves generally at home; a booklet, containing the constitution and by-laws of the club and a roster of the members of the club, to show the many benefits that can be obtained by becoming a member, whether they are local residents or not.

The office of the Lumbermen's Club was moved last week from the ninth to the twelfth floor of the Wright building.

Thos. E. Powe, president of the Thos. E. Powe Lumber Company, returned home a few days ago from a trip through the South. He visited many mills and he found that there was a great scarcity of dry lumber. When it can be obtained, it commands a fancy price.

← MILWAUKEE →

The Workingmen's Compensation Mutual Liability Insurance Company of Milwaukee has been incorporated and has opened offices in the Majestic building to issue policies to Wisconsin manufacturers, protecting them from all losses which may be caused as a result of injuries received by employes. The company will settle all claims under the provisions of the Wisconsin Workmen's Compensation act. About fifteen per cent of Milwaukee employers of labor have accepted the terms of the act, and the percentage is constantly increasing, as employers are becoming more and more convinced that settling under the terms of the act is much cheaper and more satisfactory than to defend personal injury suits in the courts. This has resulted in the need for such a company to settle all claims made by the workmen, as awarded by the State Insurance Commission, which is the jury by the terms of the act to decide the amount of damage done. The high rates charged by casualty companies on account of the provisions in the act has resulted in the forming of this mutual company. The employers who are insured will be charged premiums as low as can possibly be done and still be able to pay the claims and the expenses of carrying on the work. The forming of the company will also do much toward ridding the city of "professional personal injury" lawyers, who get most of the damage awarded the injured by a court while the latter gets practically nothing.

The deal whereby the Edward Hines Lumber Company of Chicago come into possession of valuable timberlands in northern Wisconsin was

Kraetzer-cure LUMBER

☞ Kraetzer-Cured lumber is susceptible of being thoroughly kiln dried or air dried in less than one-third the time ordinarily required for seasoning unsteamed wood.

☞ Kraetzer-Cured lumber does not case-harden, check, end-split or stain, and dries without warping or buckling.

☞ Kraetzer-Cured lumber has a uniform tone of color. Its working qualities are greatly improved, and the beauty of the flake on quarter-sawed stock is enhanced.

☞ Kraetzer-Cured lumber dries out to materially less weight than unsteamed wood, ranging from 200 to 500 pounds per thousand feet.

☞ Kraetzer-Cured lumber will neither shrink nor swell, and the grain will not raise when water stains are employed in finishing.

☞ Kraetzer-Cured lumber is not impaired in strength or quality by the process.

☞ Kraetzer-Cured lumber is produced by the use of the Kraetzer Preparator, a steel cylinder permanently closed at one end and fitted at the other end with a quick-opening and closing steam-tight door, manufactured by

The Kraetzer Company 537 South Dearborn Street CHICAGO, ILL.

Kraetzer-Cured lumber is produced by the following well-known manufacturers:

John Schroeder Lumber Company	Milwaukee, Wis.
Maple, Birch and Oak Flooring	
Russe & Burgess, Inc.	Memphis, Tenn.
Red and Sap Gum, White and Red Oak	
Bennett Hardwood Lumber Company	Memphis, Tenn.
White and Red Oak, Red and Sap Gum, Sycamore and Cypress	
Lamb-Fish Lumber Company	Charleston, Miss.
Red and Sap Gum, White and Red Oak, Cypress	
Santee River Cypress Lumber Co.	Ferguson, S. C.
White and Red Oak, Red and Sap Gum, White Ash	
Forman-Earle Company	Heidelberg, Ky.
Poplar, White Oak and White Oak Flooring	
C. L. Willey	Chicago, Ill.
Mahogany and all figured Foreign and Domestic Woods	
New England Hardwood Co.	Mountain Mills, Vt.
Birch, Beech and Maple	
Saline River Hardwood Company	Pine Bluff, Ark.
White and Red Oak, Red and Sap Gum	

Kraetzer-cure LUMBER

formally ratified and accepted by the parties on both sides recently. The total acreage approximates 100,000 and the cash consideration is unofficially said to be between \$3,000,000 and \$3,500,000. The land is situated in Sawyer and Price counties and a mill at Park Falls.

The big sawmill of the Faust Lumber Company at Antigo has started its season's cut. Between seven and ten million feet of lumber will be cut, a large amount having been purchased in the vicinity of Pelican Lake and Elderon, of which many carloads are being received daily.

At the annual meeting of the Northwestern Steel & Iron Works, manufacturers of woodworking machinery at Eau Claire, a decided increase in and growth of business was reported. An increase in volume of \$100,000 over the preceding year showed the excellent condition of the concern. K. Rosholt was elected president and E. R. Hamilton secretary-treasurer.

Ferdinand Armstrong, one of the pioneer lumbermen of northern Wisconsin, recently died at his home in Marinette. He was associated for many years with Senator I. Stephenson in the lumber business. At first he was connected with the Stephenson company at Flat Rock and later was superintendent of the Peshtigo Lumber Company at Peshtigo, which position he held for thirty years. A wife and eight children survive him. He was eighty years old.

Paul Lachmund, sixty-eight years old, for a score of years secretary of the Wisconsin Retail Lumber Dealers' Association, and one of the best-known men connected with the lumber business in the state, has died in Milwaukee. Five sons and two daughters survive him.

The State Railway Commission has issued an order directing the Soo Railroad Company to discontinue discrimination in switching rates, upon complaint of the I. Stephenson Company. The railway company was charging \$2 a car for switching at Rhinclander to the Stephenson company, while other concerns were charged nothing.

Thomas M. Blackstone, president of the Phoenix Chair Company of Sheyboygan, recently died at his home in that city at the age of eighty years. He was for many years prominent in the political and business life of the state. Mr. Blackstone was a native of Ireland and came to Sheyboygan in 1849. In 1875 he was active in organizing the Phoenix Chair Company of which he was, to the time of his death, the only surviving original stockholder. He was at first secretary and later president and manager of the firm, which operates the largest chair factory in the country.

A four-story addition is being erected to the plant of the Racine Stool Company, at Racine. It is to be of brick and measure 71 by 115 feet. The present crew of 100 men now works until 9 o'clock each evening to fill the orders. When the addition is completed the capacity will be doubled. It will provide additional space for the finishing department, salesrooms and shipping department.

DETROIT

Bert Allan of Allan Brothers reports that, considering the high price of hardwoods, business has been exceptionally good and prospects for a busy spring and summer are very bright.

A. E. D. Allan of Allan Brothers, who has been seriously ill with inflammatory rheumatism since last December, is now able to sit up for a while each day. Just as soon as his condition permits he will leave for Florida to recuperate.

Secretary John Lodge of the Dwight Lumber Company reports that that concern's flooring mill is exceptionally busy, in spite of the continued increase in the price of oak.

The Thomas Forman Company has enjoyed a busy fortnight with orders and inquiries plentiful. With a great amount of construction work ahead for this spring the Forman company expects a continuing demand for hardwood flooring. Thomas Forman of this company was out of town on business last week.

For the first time in over a year the E. W. Leech Company has noticed a lull in the hardwood lumber trade. While business has not been quite so brisk during the past month, Manager Smith is optimistic regarding the coming spring and summer.

George I. McClure says that owing to the various automobile shows during the months of January and February the auto body plants were not so busy as at other times and this resulted in a temporary decrease in the demand for hardwoods. Mr. McClure reports the trade in interior finish very good. Prices on birch, ash, elm and oak are high. There, too, has been an increase in the price of low-grade hardwoods and boxing and crating lumber. Nos. 1 and 2 oak and 2½", 3" and 4" ash are also scarce and prices are high.

F. B. Ward of Hanson-Ward Veneer Company of Bay City; Mr. Todd of the C. F. Luehrmann Hardwood Lumber Company of St. Louis and Mr. Kerns of the Kerns-Utley Lumber Company of Chicago were Detroit visitors during the past two weeks.

That the decrease in the demand for hardwoods during the past month was general was confirmed by William Brownlee of the Brownlee-Kelly Company. Mr. Brownlee says that while business done last month exceeded the trade of the same month in previous years, the hardwood men did not anticipate that the decline would be so great. The hard weather and the fact that the auto companies are not ordering so freely is probably the main reason for the decrease in business, says Mr. Brownlee. He reports that his yard is well stocked and is not short on any materials. He does not expect prices to advance any further, but rather expects a decline in the near future.

W. L. Martin of the Martiu Lumber Company of Cheboygan, Mich., was a visitor in Detroit last week.

A. L. Holmes has just returned to Detroit from an extended visit to California.

The Hardwood Market

< CHICAGO >

Severe weather in the Chicago territory during the last few weeks has somewhat retarded active building operations, and for this reason slightly less active trade has prevailed among the handlers of lumber going into buildings. A decided increase in aggregate building permits, however, is noted in the record for the Chicago building trade, and there is every reason to believe that a call from this branch of the consuming trade will be excessive in the immediate future.

While there has been some little recession in demand in all lines, it is not a condition which causes any bad effect upon the market. It comes from causes which are purely local and temporary. Some little difficulty is being experienced by the local yards in filling out their stocks. Local consuming plants also have incomplete assortments of hardwood lumber, and in some cases there is a slight disposition to meet only immediate demand from purchasers.

The usual condition prevails in all quarters, there being firm prices and a steady demand for various items of hardwoods, particularly, of course, in the lower grades. Oak, ash and chestnut are especially strong, while there has been a slight weakening in the position of gum.

The unanimous opinion of the local trade is that business will continue on the present active and satisfactory basis for the next half year at least, and that even after that term there is no apparent reason why such activity should not continue further.

< NEW YORK >

Notwithstanding a slight falling off in demand both wholesale and retail, prices continue firm with some advance noted the last two weeks. It would seem that buyers do not look for any great increase in prices but believe that any change will be toward lower values; consequently, demand is limited almost to actual needs. Some wholesalers are of the opinion that prices should be held at the present range, fearing that if they are sent higher the demand will be limited and a general reaction may result in a drop in prices.

Plain oak remains in steady call; chestnut and common maple also show strength. Sound wormy chestnut has advanced \$2 on 4/4 stock and \$1 on thicker. Thick ash shows another advance and this lumber is now perhaps the strongest feature of the market. Birch, maple in the common grades, and poplar are strong at higher prices. Reports are still received of short supplies of good grades and this, with the healthy movement of lower grades, augurs well for a steady spring market.

< BUFFALO >

Trade in hardwoods continues a little more active than it usually is at this season and the scarcity of lumber makes it a difficult matter to fill many of the inquiries. Lumbering conditions in various sections have been unfavorable much of the time, and this has had its effect on prices, which have been firm all around. Plenty of snow has made handling of lumber at the local yards difficult work during the present month. There is also some complaint of freight congestion in local railroad yards.

Plain oak has been in better demand than any other hardwood and its scarcity has made prices very firm. Frequently cars come in and are moved without being piled up in yard. Quartered oak holds pretty firm and at better prices than a year ago. Brown ash, birch and maple are among the other woods most wanted, though everything seems to be in fair inquiry. Poplar and basswood are firmer, in the lower grades especially. The mills have but little low-grade stock to offer.

< PHILADELPHIA >

With the exception of a slight advance in one or two lines, there has been no appreciable change in the hardwood market from a fortnight ago. The increasing demand for material employed in the manufacture of furniture, automobile bodies, caskets, etc., supports a lively activity in the consuming industries, and nowhere is there a noticeable increase in the pile at the yards. Notwithstanding the presidential inauguration and the prospect of an early session of the new Congress, the business man continues to hustle along as if nothing unusual were in the air, which is a strong indication that every confidence is felt as to the outlook, and that politics for once at least is powerless to disturb a settled commercial equanimity.

There has been a slight diminution of activity in the box factories, but it is believed to be only temporary. Shipments are reported a little easier, but the depleted stock at mill ends is very discouraging to the hunter for desirable material, with no promise of improvement for

Announcement

To Veneer Consumers

☞ Within a few days our new plant will be operating.

☞ We will be equipped to saw and slice high-grade veneers, in mahogany, quartered oak, Circassian walnut, American walnut and rosewood, and to manufacture band-sawn lumber in the same woods.

☞ Our superintendent and the operators of all our machines are recognized as without peers in their respective lines—their work insures the most perfectly manufactured Veneers and Lumber possible.

☞ Our veneer and band saw mill is the most modern and best equipped in America.

☞ Through our log buyers here and abroad, we always have as fine a grade of logs as can be procured by anyone.

☞ You are cordially invited to inspect the mill, and we believe you will be repaid whether you are now in the market or not.

Cass, West Virginia. NEW YORK

some months to come. The open winter has given an impetus to building work, and a big year is anticipated.

Among the hardwoods plain oak is distinctly the scarcest article on the market, with prices climbing dangerously high; many orders are turned down because of lack of supply; quartered oak is forging ahead; ash is in great demand; the better grades of chestnut are inclined to lag, while sound wormy chestnut, 4/4, 5/4 and 8/4 is very active. Maple, beech, cherry and basswood hold good position. Low grades only of poplar show activity. The mahogany and veneer market is well sustained; birch is making new friends.

← PITTSBURGH →

The hardwood situation continues very satisfactory to the man who has lumber to sell. Prices are firm and the prospects are that there will be a tight lumber market all this spring. Demand from the manufacturers and big industrial concerns and the railroads is keeping up fairly well and there is an undertone of buying sentiment that promises to develop into some fine business for the wholesalers before summer. Everything looks busy for the Pittsburgh district for the first eight months of this year. During the past few weeks there has been some halt in the rush of orders that prevailed just before January, which was accounted for entirely by political conditions, the fear of a big firemen's strike on the eastern roads, and the Mexican situation. Among retailers there is a feeling that building will be at least twenty-five per cent greater in volume this year than last. They are increasing their total of inquiries and orders right along, and with a little good weather to encourage contractors some big business is expected in this line.

← BOSTON →

The general market for hardwood lumber is very firm and the tendency of prices continues upward. Dealers in this market state that the advance is not caused so much by an active demand as it is by the real shortage in the hands of the manufacturer and wholesaler. Dry stock has been in very small supply for some time, and there is no immediate relief in sight. Naturally manufacturers are not anxious sellers at the present time.

The demand for nearly all classes of hardwood lumber is very fair and the outlook favors an increasing business. Manufacturing consumers are using good-sized quantities right along, and few have more than moderate sized reserve stocks. One of the features of the Boston market is the strong call for both plain and quartered oak. Plain oak, one inch ones and twos, is firm. It is reported that better than top prices have been paid where quick delivery has been demanded. Quartered oak, one inch, is selling at very good prices. Black walnut has been in fair call, and prices are firm. There has been a very good call for maple of late. Cypress is held in a fairly steady way under a moderately active demand.

← BALTIMORE →

The favorable conditions which have obtained in the hardwood trade continue in evidence, being perhaps even more pronounced than formerly. Oak does not seem to have touched the highest figures, with the demand very active and the mills out of stocks. Although large quantities of oak have been shipped abroad, it does not appear that any advance toward congestion has been made, the receipts being picked up as fast as they came to hand, with the result that the entire list is high, the mills are unable to take care of all the demands made upon them and stocks so scarce as to deserve designation as a shortage. The most diligent inquiry fails in many cases to develop sources of supply, and the hardwood man who takes an order without knowing where he can get hold of the lumber to fill it runs the risk of making a loss. There appears to be no really fixed price, each producer naming the figure which to him seems to represent the real value of the lumber asked for, and it follows that there are material variations in ideas of values, a millman who is thoroughly informed being in position to turn his knowledge to excellent account. Next to oak chestnut appears to be in strong demand, with sound wormy and all other grades being freely called for, and with the quotations either holding their own or being marked up. Much chestnut is also finding its way abroad, and between the domestic and foreign markets the producers are having all they can do. Common poplar is less strong, the offerings having been rather more plentiful than the requirements of the trade called for, and the freedom of shipment serving to impart an easier tone to the trade. With regard to extra wide stocks, it is also to be said that they still fail to realize the expectations of the producers. Under existing conditions, with the needs of the automobile builders so restricted and with extensive substitution of other materials, it is only natural that there should be no special buoyancy in these stocks, which are called for only in comparatively small lots. Other divisions of the hardwood trade are in the main satisfactory, the lower grades in particular being sought in such quantities that the mills have been unable so far to accumulate stocks in any considerable volume. How to get their wants filled is one of the chief problems of the dealers, who can get orders by simply writing for them but find the supply inadequate. One wholesaler, for instance, stated as an illustration that he had been able to secure only four cars of a certain grade of lumber when he could easily use fourteen. Some trouble on account of a car shortage is also being experienced. Beyond this, however, and the relative inadequacy of the supplies, the hardwood

Timber Values

Timber is cheaper today than it was thirty years ago.

That is our sober conclusion after a review of all the facts that influence or touch timber values.

Thirty years ago neither timber nor its products was worth much. If logs would not produce a heavy percentage of high grade stock they were worthless and being worthless were left in the woods.

Timber is being used more closely. It is in request for many purposes of which the early operators did not dream. To its use as lumber and in similar forms is being added a demand for timber as the raw material for chemical treatment. For such use wood of sound quality is required, knot, shake and crook defects which render logs valueless for lumber do not reduce their value for chemical treatment.

Thirty years ago about 25 per cent of the timber in a forest was used. Today there is an outlet for possibly 60 per cent of it. Within another decade we expect to see 80 per cent of it used—a gain of 33¼ per cent.

Every addition to the list of wood users gives added value to timber of all kinds by broadening the market for it.

All timber owners are sharing in this constant betterment in prices. Do you own timber?

trade has nothing to complain of and the state of activity shows no signs of abatement.

◀ COLUMBUS ▶

Despite the rather unfavorable weather which has prevailed during the past fortnight, the hardwood trade in Columbus and central Ohio has been fairly active. Demand is coming in from both retailers and factories, and it is about a "stand-off" between the two in buying. Shipments are coming out fairly well and there is no delay occasioned from a lack of cars.

Prices are ruling firm and every change is towards higher figures. No weakness is apparent in any grade or variety. Dry stocks are generally light and all efforts of mills to increase stocks have been unsuccessful because of the good demand. Yard stocks are heavier than formerly, but are still rather light and good buying from that source is expected right along. Active preparations have been made for a good building season, judging from the work on hand in architects' offices. Factories are generally prosperous. Furniture concerns have a good trade, and as a result are buying stocks rather liberally. Factories making implements and vehicles are also good purchasers. Manufacturers are not stocking up on materials but are buying what is needed for immediate use.

The movement of the lower grades is good, but all grades are moving well. In fact, there is no accumulation of stocks and prices are very strong as a result. Collections are reported better in most sections. Both plain and quartered oak is in good demand and the volume of business is good. All grades of plain oak have advanced and the tendency is still upwards. Chestnut is one of the strongest points in the market, especially sound wormy. Basswood is moving well and the same is true of ash. Poplar is strong and automobile factories are buying the wide sizes better. Other hardwoods are firm and unchanged.

◀ CINCINNATI ▶

There is nothing but confidence in the future market as expressed by all dealers, who report numerous inquiries covering all items on the hardwood list, the most inquired for being plain oak and ash in all grades and thicknesses, while other woods are much in request. High prices prevail and still higher prices are looked for. Notwithstanding the fact that there have been some very heavy receipts of almost all kinds of lumber during the last few months, stocks here are only medium, as the demand has been almost up to the receipts. Yards are, however, in much better shape to take care of the coming heavy spring business than they expected to be. Southern manufacturers are none too well supplied with stock with which to fill orders that are being constantly offered to them by the big buyers. They claim that there is sure to be a general shortage of practically all hardwoods this year. There is not at the present time nor can there be an accumulation of dry stock before midsummer at least and then only in case of a big slump in demand which is quite unlikely. Dealers are all well satisfied with conditions of the hardwood market.

All items command top prices, with plain oak simply out of sight, and dealers claim this wood will go still higher. Manufacturers of oak are in a very strong position and demand the highest prices in years for all grades. They have only light supplies, the continuous demand having taken up stock as fast as in shipping condition. What there is on sticks is practically sold ahead and the chances are slim for dealers to get what is needed for their requirements. Quartered oak is also much in demand and is gaining in price. Close to plain oak is the demand and the scarcity of ash. This wood is very hard to obtain and all grades and thicknesses sell quickly. Chestnut is also very strong and sound wormy is much sought for. Maple sells readily at good prices. Cottonwood in No. 2 and 3 common is very hard to find, and all dealers are short on this item. Gum is doing well in the upper grades and the low grades are very strong, the box factories accepting at good prices all low-grade hardwoods suitable for their purpose. The general condition of the market is satisfactory and a big year for the hardwood dealers is freely predicted.

◀ TOLEDO ▶

The local hardwood yards are far from having well-filled stocks, although dealers have been buying fairly liberally. Buying has been free nearly all winter, however, and dry, desirable stocks have been scarce. Prices continue extremely firm. There has been an increase of from \$2 to \$4 in plain red oak, firsts and seconds having been quoted on the local market at about \$62. Hickory is not especially strong in demand just now but basswood and maple are stronger. Maple flooring is in good demand and there has been an increase in price. Quartered oak is not so strong in demand, although there is a fairly firm call from furniture concerns. White oak is strengthened but is short in supply. There is every prospect of a strong season as soon as the weather permits, as shown by the plans in the offices of local architects.

◀ INDIANAPOLIS ▶

Hardwood men, generally, in this vicinity say they are well pleased with the hardwood situation. In many lines it is difficult to obtain a sufficient supply of hardwoods to meet the demand. This is especially

A Remarkable Shipment of Mahogany

For the past two weeks we have been unloading at our Chicago plant the most remarkable shipment of mahogany logs we ever received.

This shipment fills several cars and is made up of nearly six hundred selected logs.

Every precaution was taken to insure as far as is possible in mahogany only such logs as will produce the very highest type of mahogany veneer for high-class cabinet purposes.

Those logs already opened up reveal an amazing quality, character and variety of figure. We will secure from this shipment some brilliantly mottled wood for high-class piano manufacture.

Unusually good stock for furniture purposes has already been cut from this shipment and a very considerable quantity more is insured.

Altogether, judging from what has already been shown, this shipment will place upon the market the finest stock of mahogany veneer that has yet been turned out at our plant.

Buyers are already too familiar with our perfection of manufacture to need further explanation of our methods.

Users of mahogany visiting Chicago are earnestly invited to call and inspect the Willey plant and veneer and lumber warehouse at Robey Street and Blue Island Avenue. Blue Island Avenue car at the postoffice to Robey Street.

C. L. WILLEY, Chicago

*Largest Mahogany Veneer and Lumber Producing Plant in
the World*

true of all grades of oak. Prices are much higher than they were a year ago and there is no indication of a break in the market soon. Business throughout the winter has been much better than it was during the corresponding period of last year. According to manufacturers and wholesalers the retailers are somewhat timid about taking hold and placing orders for large quantities. Some of them seem to feel there will be a reaction later on, accompanied by a reduction in prices, but there appears to be no foundation for this.

← NASHVILLE →

The hardwood lumber market of Nashville continues satisfactory. There is a greater demand than supply of oak, and large manufacturers have stopped taking orders in this department. High-grade poplar has been in better demand, and chestnut is moving in a satisfactory way. Wholesale lumbermen generally express themselves as well pleased with the business conditions. The main question now is securing adequate supplies of raw material.

← LOUISVILLE →

Hardwoods are exceedingly good property just now, and a bill of lading for a car of plain oak is regarded as about as good collateral as a two per cent government bond. Lumber is really scarce, and buying aggressive, a combination which means one thing at least—exceedingly stiff prices. The demand for plain oak is regarded as a constant factor, inasmuch as it has been a feature of the situation for many months. Quartered oak has had a few ups and downs in that time, but at present is in excellent call, and prices have responded to the improved demand. Handlers of the commodity reporting that buyers want material and are willing to pay the advances. This is believed to be largely due to the scarcity and high price of mahogany lumber, which has caused furniture manufacturers and others who were intending to feature the imported wood to return to quartered oak as being the best buy, in view of prices and availability. Other woods are almost as active as oak. Ash, for instance, is almost out of the market on account of extreme scarcity, and buyers who need the stock are continuing to take it unaged. Maybe some of the trade will begin to specify "Kraetzer-Cured" in the near future, if the current scarcity continues. Chestnut is also pretty well sold out, with little surplus of any grade. Poplar is improving in the upper grades, the lower having been brisk all season. Red gum is scarcer, and the upper grades particularly are hard to find. The outlook is for continued good business, and thus far President Wilson has not scared a single soul.

← ST. LOUIS →

The general hardwood situation is strong. The upper grades in oak, gum and cottonwood are in splendid demand. The lower grades are also good sellers. The best item in demand is oak. Ash, too, is being much sought after. Poplar is not selling well; in fact it is the poorest seller in this market. Dry stock in all items is very scarce and on this account there have been advances in prices. Buyers in the South can find but little dry stock, owing to the continued wet weather which has prevented logging and which has curtailed the output seriously. There is considerable activity in cypress, some slight advances being reported. Those having good stocks on hand can obtain any reasonable price for their holdings.

← MILWAUKEE →

The stormy weather of the past week or so has delayed small building operations in this city and about the state, but there is more large building going on in Milwaukee than ever before at this season of the year. A record number of permits are being issued by the building inspector and there is every indication that the spring building season will be unusually active.

Retailers all over the state have been rushing in their orders of late, so that their stocks may be in readiness for the spring rush. Stocks in retail yards are much lighter than usual at this time. The scarcity of dry stocks makes it necessary in most cases for the jobber to postpone delivery on orders and there is considerable uneasiness, because the situation is becoming complicated by a shortage of cars in some sections of the northern Wisconsin lumber country. Manufacturers are finding it hard to secure adequate transportation facilities, while loggers in many cases have to deck their logs at an extra expense of fifty cents per thousand feet. At the present time more than 300 carloads of logs are being received daily in Marinette and Menominee over the Chicago & Northwestern, the Chicago, Milwaukee & St. Paul, the Soo and other roads. This is about fifty carloads more than last winter at this time.

The scarcity of snow and labor has been felt in Wisconsin, Michigan and Minnesota logging districts during the winter, but lumbermen say that the Wisconsin and Michigan districts will produce more than a normal output. Practically every large mill in the lumber country is in the market for logs, most of them having heavy orders booked. Stocks at all the big mills have been decreased greatly during the past six months and many concerns are sold well ahead of their season's cut.

The light shipments of oak which are being received from the South are resulting in higher prices for both quarter-sawed and plain oak. Demand during the past year has been much stronger, while it is said that logging and lumbering operations in the South have been hindered by the excessive rains. Northern stocks, including birch, maple, basswood and rock elm, are practically exhausted in upper grades. Jobbers say that if the market continues to hold so firm with prices high, it may tend to restrict business, but trade has been active thus far. It is true, however, that the sash and door concerns are buying only enough to satisfy their immediate wants, and are inclined to await developments. Demand from other sources is strong.

◀ DETROIT ▶

During the past fortnight the Detroit hardwood market has experienced a slight slump but dealers all predict that business will soon pick up. There has been a good demand for oak with Nos. 1 and 2 grades scarce and prices advancing continually. Birch, elm and ash have also been in demand. A decrease in the amount of orders from the auto body plants has depressed the market. The hardwood flooring trade, however, is exceptionally busy with orders and inquiries plentiful despite an increase in the price of the finished product. An increase in low-grade hardwoods used in crating and boxing is reported. The box and veneer trades are fairly busy and prospects are favorable for good business this spring. A large amount of building is in prospect for this spring and this will mean strong demands for hardwoods for interior finish and flooring.

◀ GLASGOW ▶

The carters' strike in this city still continues with hopes of a settlement still as far off as ever—all efforts having proved futile so far. Both sides are determined to yield nothing, with the result that the general trade of the west of Scotland is becoming more and more disorganized. The masters firmly maintain that as the strike was not of their seeking they are quite prepared to fight the traders' battle, and contend that if they gave way in this instance they would be faced with the same trouble in six months' time. The congestion at the quays is becoming serious, each succeeding steamer dumping its cargo which is left there practically untouched. In the case where goods require to be stored under cover the only course left open is to put them outside and cover them with mats, with the result that the goods are damaged.

The S. S. "Marina" arrived a few days ago from Baltimore and Newport News with a large cargo of American hardwoods, comprised chiefly of oak planks on contract for the railway companies. Parcels of walnut, poplar, and oak lumber were sent forward in addition to a few logs of oak, walnut and poplar. Discharge is not yet completed but what is out is of good quality throughout. The S. S. "Irthington" has just arrived in port from New Orleans with the usual assorted cargo. The notables in the shipment according to manifest are pitch pine—both lumber and logs—cypress, gum and oak. Hickory and ash logs are also a predominating feature, having been notable in the last few steamers. Of course, they are all in fulfillment of contracts made toward the end of last year. Staves are also a big item, but gum staves, for which there is no outlet at present, have come in too freely for the past month or two, and each shipment has had to go into store. Plain oak boards are in good request and the high prices asked are being paid. With no yarded stocks available, keen competition is evinced for the consignment parcels.

Spruce and birch deals have come in in small shipments, but as delivery of the goods cannot be obtained buyers are somewhat reluctant to purchase. Of course, the prices demanded have a say in the matter as well.

The import of birch logs is fair and good parcels meet with prompt disposal. Shipbuilding continues brisk, and it is to be hoped that other wood-consuming industries will pick up a little better and show a fair return for the first quarter.

One of the local railway companies has just issued a large inquiry for the supply of oak scantling to fulfil its yearly requirements.

Pitch pine charterers are holding off from chartering ahead of their immediate requirements, evidently waiting till the horizon of the freight market becomes clearer.

◀ LIVERPOOL ▶

The market position here has been chiefly dominated by the three mahogany auction sales this week. There has been a strong company of buyers and again a keen demand for all classes and grades was noticed. Speaking of mahogany reminds us of an interesting rumor afloat concerning a well-known mahogany veneer cutter of New York. This dealer, who has recently opened up operation in the Liverpool trade as a merchant, contemplates buying his mahogany direct; with this object in view, he intends to send a representative out to the coast of Africa to complete his purchases direct. Surprise is expressed that this has not been tried previously as purchases through the auction sales are undoubtedly expensive and slow without any compensating advantages. This experiment has occasioned much interest and has been quite the topic of conversation. The general opinion seems to be that the new enterprise is bound in the long run to be successful because of the heavy expenses which the auction sales add to the cost. Of course the mahogany brokers have a powerful hold over this importation business and they are not going to release their hold over it without a big struggle. At the same time in these days of keen competition it is surprising that such an out-of-date and cumbersome method of business should still be in existence. It says much for the enterprise of Americans that one of their number should have been the first to inaugurate a more up-to-date system of business.

The hardwood market is not nearly as firm as was noted at the end of last year, and prices have slightly weakened in several instances. Hickory is distinctly weaker. Some parcels have brought only 2/7 and even 2/6, while as high a price as 3/- has been realized. Ash lumber is a good point. Prime stocks are going very well and No. 1 common stock has sold better than has been the case for some time. It is a pity with No. 1 common white ash that shippers do not send the stocks 6" and up to

this market instead of 4" and up. They would do better with it. Birch will come to a good market but oak is a bit overdone; especially is this so with round logs which have been very early imported. Wagon oak, however, is quite scarce and is bringing top prices. The volume of trade is quite up to the average, though the margin of profit is cut very fine.

THE RUSSEL COMBINED SKIDDER AND LOADER IN OPERATION

Russel Logging Cars are built to stand severe service, of any capacity desired or to suit any length of log.

Logging Economy will interest you

The most convincing proof of any machine's efficiency, next to a personal trial, is the expression of those who have used them.

We shall be pleased to furnish you with the proofs or the names of the operators who will be glad to show you the machines in operation.

The Russel Combined Skidder and Loader has demonstrated itself to be superior in design and construction. The great decrease in cost and increased efficiency of logging is bound to appeal to the operators.

Baldwin Geared Locomotive

Logging Locomotives must operate on steep grades, sharp curves and uneven tracks. This is what the geared locomotive illustrated has been designed to do. It is symmetrical in construction, and power is transmitted to the axles through a central drive. The valve motion is simple and accessible, and all new features have been tried out in service.

This locomotive is well-designed, well-built and fully guaranteed. Various sizes can be furnished, to suit different track and operating conditions.

Chisel Bit
Saws

Absolute Uniformity

That's one of the reasons why ATKINS SILVER STEEL INSERTED TOOTH SAWS, Bits and Holders are so popular. You will find no variation in temper, pitch or bevel. The heat treatment is prescribed by the chemist, based upon an analysis of the steel. So that we always secure that perfect degree of hardness and toughness which you require.

ATKINS SILVER STEEL SAWS

Place your next order from your regular source—but specify ATKINS SILVER STEEL SAWS. That's the way to insure getting "The Finest on Earth." Don't be satisfied with any other brand. We absolutely guarantee the best results. We make good.

Westinghouse Motors form the Reliable Drive for Wood-Working Plants

AFTER Westinghouse motors are properly installed in a wood-working plant, the only attention they require is an occasional cleaning, inspection and lubrication. Beyond this, there is nothing to be done.

They are ready to start any moment they are wanted and they keep the machines they drive in continuous operation until the power is shut off. They are very rarely out of commission for repairs. Their life is very long; some of the first Westinghouse motors are still in successful operation.

Such reliability is the result of long experience in design, thorough study of operating conditions, and great care in manufacture. These factors combine to make Westinghouse motors more reliable than the service conditions, for which they are intended, require.

Of course, like any other machines, these motors must be properly installed. Westinghouse service takes care of this detail by giving full information on the installation of Westinghouse motors in any plant.

To receive full assurance of motor reliability, specify "Westinghouse Motors."

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

Custom Mill Work, Storage, Inspection

ON

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

Astoria Veneer Mills & Dock Co.

Long Island City, New York

Veneers and Panels with a Reputation

WE manufacture Veneers in all the native woods and for all purposes. Also Built-up Panels in native and foreign woods—three and five-ply—and have established a reputation for furnishing high-grade material. Send us your inquiries and orders and become one of our satisfied customers.

EASTERN REPRESENTATIVE, John L. Cochran
601 W. 115th Street, New York City

YOU pay a *little* more for our hardwood lumber than you do for many others',
but it's worth *much* more.

With our modern and first-class equipment and expert operatives, we couldn't make bad lumber if we tried to, because the *quality* and *size* of our virgin tough mountain white ash, red birch, yellow poplar, buckeye, maple, red oak, cherry and basswood, averaging less than three logs to the thousand, and 95 per cent sixteen feet, is the best type of hardwood timber growth in the United States, and shows a larger percentage of *firsts*.

If you are a discriminating buyer, let's get acquainted.

The "What & Why" of McIlvain Service

With yards in the heart of the best lumber districts, we are able to fill practically any lumber order. Having fifty or more shipping points, we are able to facilitate prompt delivery. The size of our organization enables us to quote rock-bottom market prices. Our business has been built on giving our customers such service as would be a continual source of satisfaction—we would continue building.

An important feature of McIlvain Service is the monthly stock list—A postal will bring "Lumber News" regularly

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

"WE ARE GETTING RESULTS"

WRITES ONE ADVERTISER

This Means That He Is Getting

NEW BUSINESS

Through His Ad

If we can do it for him is there any logical reason why we can't for you?

MAKE US PROVE IT

HARDWOOD RECORD, CHICAGO

Welcome to Our City

When you are buying your ticket for a trip into the hardwood country, don't forget to tell the man to make Louisville, Ky., your destination. It's unnecessary to arrange merely for stop-over privileges, for the reason that when you get here we'll make things so interesting for you that it will be unnecessary to proceed further.

You know all about the traditional Kentucky welcome, of course, and it's taken for granted that you realize that this is still on tap, ready for wanderers like yourself who don't have a chance to enjoy life in God's country very often. But we've got more than a mere welcome; what is more to the point, we've got the goods.

In these piping times of good business, with everybody in the market for something or other, and a lot of items as hard to find as the storied needle in the hay-stack, the advantages of trading in a market like Louisville are even more apparent than at other times.

That is to say, you can get quartered oak, and plain oak, and poplar, and ash, and hickory, and mahogany, and veneers, and panels, and about everything there is to be had in the hardwood line, right here; it's a good deal like going into a department store and buying a refrigerator in the basement, a diamond ring on the first floor, a suit of clothes on the second and a dinner on the roof. Anything you may happen to want is here. If you don't see it, ask for it.

We'll be looking for you.

“I believe your new service showing the exact requirements of the Veneer and Panel Trade to be highly accurate, and a necessary part of the office equipment of any progressive veneer or panel factory.”

The same information would cost you thousands of dollars. The cost of our service is a small fraction of that.

Ask your competitor to tell you how it has helped him, and then write us for details.

HARDWOOD RECORD,

CHICAGO, ILL.

500 Copies Sold Within a Week After Prospectus Was Issued

Hardwood Record announces the issue on April 15, 1913, of an Authoritative Commercial and Scientific Book

American Forest Trees

By Henry H. Gibson, Editor Hardwood Record
Edited by Hu Maxwell, Wood Utilization Expert

The Work Involves :

First: A botanical description of the more than 300 species of American forest tree growth.

Second: A physical description of the wood of these species.

Third: A recital of the chief uses of all important American woods, together with suggestions of advantageously broadening their uses.

Fourth: Complete information concerning the range of growth of all varieties.

Fifth: Related trees are logically grouped according to families and spe-

cies; important species covered in substantial detail, and brief mention of the woods of minor importance.

Sixth: Scientific name of each tree is recited, as well as the various common names by which it is recognized in different parts of its range of growth.

Seventh: The properties of the various woods are carefully analyzed, particularly weight, hardness, stiffness, strength, elasticity, toughness, color, figure, and seasoning and lasting properties.

☐ The book will contain between 650 and 750 pages, will be printed on the best quality of enameled paper, and handsomely bound in half leather, dark green roan back and corners, with basket cloth sides, silk head-bands, gold stamping on the back, and gilt top.

☐ The work will be illustrated with more than 100 full-page pictures on plate paper in sepia, outlined in orange, from photographs, covering all the chief commercial varieties of virgin forest timber growing in the United States; and also with numerous engravings, from drawings and photographs, showing leaf and flower forms, etc.

☐ The price of the work is \$6.00, delivered by express or mail, and is sold only on subscription.

☐ An order blank, and a prospectus, showing the character of the paper, size of page and style of printing will be forwarded on application.

Review and Outlook

General Market Conditions

THOSE HANDLING NORTHERN WOODS anticipate the imminent drying of a considerable quantity of northern stock simultaneously, and believe that such a condition will be a blessing to the hardwood handling and consuming trade rather than, as would be the case under ordinary conditions, having a detrimental influence upon the hardwood trade. In other words, there has been such a decidedly short quantity of stock that any sudden placing of a large amount of dry hardwoods on the market would not break the market, but would simply go to fill up requirements which actually have been short for several months. Of course, there has been the usual active selling, but a mere sale will not put dry stock on sticks either in a distributing yard or at the wholesale consuming factory.

The wholesale element can probably appreciate this condition more acutely than can any other branch of the hardwood trade. A great many wholesale concerns whose selling organizations are perfect have merely been able to supply the actual immediate demands of their trade, and hence the acquisition of a large quantity of dry northern stock will certainly be considered by them most favorably.

Very little change has been noted recently in the southern producing field in the matter of logging, save that in some sections the planting season has already resulted in the withdrawal of innumerable teams from woods operations for work in the fields. Of course the effect of such a shortage of horses and labor in logging operations will not be particularly excessive, because the small farmer operating in the woods hauls in only a relatively small amount of logs annually under any conditions. Still, with the demand for logs as it is now being maintained, even this influence on the supply will be felt in every section where such conditions exist. It will mean that the supply of logs secured through other methods will be strained to a greater degree.

The small mills throughout the southern hardwood fields have actually produced considerable stock during the last few months, but there has been a veritable swarm of buyers from every class of wholesale and consuming houses, with the result that where these small accumulations of hardwood lumber have not been snatched up immediately, the owners have been wise enough to play one buyer against the other, and have in some cases realized outlandish prices for stock of mediocre manufacture.

It is undoubtedly a fact that various conditions have somewhat checked immediate building activity with the coming of the early spring months. Three causes can be seen as possible explanations of such deferred activity. In the first place high prices on all classes of raw material entering into house construction are actually being considered seriously by home builders before they invest their savings

in house construction. Lumber is not the only commodity for building purposes which has increased in value, and the aggregate increase of all raw material makes a considerably greater expense to the home builder than he would have incurred a few years ago in erecting the same type of house.

A second point to be considered is the tightness which has prevailed in the money market for some little time, which would necessarily have the effect of reducing activity in speculative building. Such a condition has actually been observed and it is reasonable to suppose that the money tightness has had some influence.

Further, the uncertain seasonal conditions probably delayed contractors in getting started at their work. The holding off of rigid winter weather in most of the northern states led a good many people to believe that winter was merely being deferred, and they were not willing to take a chance of starting on building operations and being held up later. This prediction has been carried out and it is quite likely that after the last violent effort of winter things will open up much more actively. In fact a great many houses built on a speculative basis have not found a ready market because of the open winter, and it is anticipated that with pleasant spring weather coming in these will find a ready sale, and speculative builders will enter into new contracts for further structures.

The factory trade is for the most part not placing large orders ahead, but is purchasing a considerable quantity of lumber for immediate use. This would indicate that buyers are still anticipating a break in prices, and the question has resolved itself into one of judgment as between the sawmill man and the wholesale buyer. The sawmill man reiterates constantly that he sees no chance for a break in hardwood prices for several months, while, as suggested, the buyer through his buying policy and sometimes through his expressed opinions shows that he thinks such a break is imminent. Regarding this question there is still every reason to believe that the sawmill man is correct in his opinion.

Plain oak continues to be the king of them all at present. Probably the demand for this wood has been somewhat accentuated in addition to the regular lines of consumption, by its increase in favor in high-grade furniture manufacture. Recent offerings on the part of furniture makers have shown a considerable quantity of high-grade plain oak furniture, which seems to be taking very readily.

Quartered oak continues to forge steadily to the front. Some items of quartered oak are actually short, and all of the better grades are commanding constantly stronger prices, and are showing a steadily improving demand.

Low-grade hardwoods in some items are practically not in the market. A large manufacturer in one of the biggest of the southern

hardwood centers, which taps the poplar region, recently stated that that city contained only about ten cars of available one inch cull poplar. This same city contains an extensive box factory, and at the time this statement was made this factory had only enough poplar lumber to carry it a week, and no definite prospect of getting any considerable further quantity.

Gum, particularly red, is still somewhat off-color, although there is no break in price. Still there is quite a little of this stock to be had.

All told the situation continues to look very favorable, and while as noted before, there is some tendency to consider the argument of the buyer in the matter of prospective break in price, still this sentiment is only occasionally apparent and should have no weight in affecting the actual market.

National Drainage Congress

THE THIRD NATIONAL DRAINAGE CONGRESS will be held in St. Louis April 10, 11 and 12, at the Planters' hotel. Arrangements have been made for several thousand delegates, and the program includes a number of very important matters. The development of the vast areas of swamp and overflow land in this country constitutes a problem for the present and the future to solve. The sessions of the congress in St. Louis are open to the public.

Menace in High Prices

A LEADING MANUFACTURER of oak lumber and oak flooring in a letter quoted in the "Mail Bag" section of this issue of HARDWOOD RECORD, utters a protest against the current trend of boosting oak lumber prices to an unreasonable degree. If this protest came from an exclusive consumer of hardwoods, it would not be deemed remarkable, but originating as it does from a man whose interest lies more in the production than the consumption of this wood, the protest should receive consideration.

This is not the only instance where leading producers of oak lumber are protesting against what they regard as taking an undue advantage of consumers incident to the shortage of stock, to demand prices for their product which are out of proportion to values commanded by other leading hardwoods. They believe that excessive prices will induce increased substitution, not only in other woods but in materials other than wood, which will have a permanent effect in checking future demand for oak, notably in the interior finish and furniture trades.

The writer of the letter referred to calls attention to what happened to wide poplar five years ago when it took on a boom by reaching a price of fifteen cents a foot before the advance ceased. Wide poplar can be bought today for a little more than one-half this price, and it is a dull seller at that. The street car panel trade, automobile body business and the panels for delivery wagon sides have largely gone to steel, and it is doubtful if the trade is ever to be reclaimed for lumber.

Oak ties have gone so high that the railroads have found that they can successfully treat ordinary types of hardwoods and make ties at less money, and of equally or better lasting qualities, and hence there is a tremendous increase in the production of ties from beech and kindred woods which formerly were not even considered as a substitute for oak.

As the writer observes, "good common sense and conservative action should be employed to check radicals, who at this time are seeking to boost prices on some woods beyond the point of safety."

Lake Carrier

THE PICTURE ON THE FRONT COVER of this issue of HARDWOOD RECORD represents a scene where lake and forest meet in the hardwood region of northern Mississippi. The sheet of water is Lake Carrier, near the headquarters logging camp of the Carrier Lumber & Manufacturing Company, about twenty miles from Sardis. It was formerly a deep bayou, and was, of course, an old river channel not wholly silted up since the current ceased to flow through it. It was once known as Bobo lake, and the customary traditions and superstitions were associated with it,

particularly as it was known to the colored population who can see and hear things after dark.

That is a typical hardwood region. Some of the best white oak of the South comes from here, and there are many other kinds of timber, such as red oak, red gum and tupelo. Undisturbed nature has done her best work here, and forests have covered the region since time immemorial. The storehouse is now being drawn upon to meet the demands of commerce.

Lake Carrier and the surrounding region have been long familiar to hunters, fishermen, and campers. The woods were formerly full of deer, and there are some yet; the water courses and the half-hidden lakes and bayous abound in ducks and other waterfowl; the tree tops are alive with creatures that fly or climb; and the waters teem with fish. No sportsman or lover of nature could ask for more.

It is inevitable, and to some extent regrettable, that the saw-mill, tramway, and tote road must invade scenes like this and disturb the beauty and break up some of nature's associations; but trade and commerce demand it, and it must be done. The country's call for lumber penetrates the fastnesses of mountains and the quietude of lowland forests, and the response comes back from scenes like Lake Carrier.

Liverpool Mahogany Sales

LAST MONTH'S AUCTIONS OF MAHOGANY at Liverpool resulted in practically a cleanup of every desirable piece of wood in that market. The demand was active and prices ranged high. There is no evidence that the stock will be replenished to any considerable extent for some time to come. At the present time there is a strong demand for medium to large sized African logs, and highly figured logs of good dimensions are much sought and realize high prices.

Good Cuban wood is in active demand, but the run of this stock at present is largely not of either the size or character that made the extraordinary reputation for this splendid material. Large fancy Cuban logs command the highest price in the history of the trade, and other descriptions are selling at fair values.

There is very little mahogany being received at this time from Colombia, Guatemala, Honduras, Mexico or Nicaragua. It now looks as though mahogany values in logs, lumber and veneers would range very much higher for some time to come. This certainly will be true if supply and demand cut any figure in the situation.

Evolution in Hardwood Demand

FOR MORE THAN SEVEN YEARS HARDWOOD RECORD has been engaged in collecting, collating and putting in both bulletin and card index form a record of the annual requirements of the majority of wholesale hardwood consumers throughout the United States and Canada. These record paragraphs show the state, town and name of the concern, line of goods produced, name of the buyer, and recite by quantity, kind, grade and thickness items of annual consumption. Constant work on this record constitutes an important study in hardwood evolution and economies.

In the latter part of February a correction bulletin involving more than fifty pages was printed as a supplement to this service. In this bulletin were carefully revised the requirements of more than twenty-five hundred consumers, and remarkable as it may seem there were corrections required on more than twenty-five per cent of these paragraphs, owing to a change made by the purchasers of hardwood materials in their lumber requirements.

A study of the record indicates that every buyer is attempting to reduce his cost for lumber materials by substituting lower grades or lesser priced woods than formerly. Beyond question wholesale consumers are fast learning that it is possible to utilize lower grades of standard woods to advantage, and also in many cases to advantageously employ cheaper woods for the higher priced ones formerly purchased.

While these wonderful changes in requirements are rather upsetting to general conditions, they all trend to higher efficiency and

make for closer utilization of the present hardwood product of the country.

The total cost of this service to HARDWOOD RECORD in the past years has been approximately \$50,000, but it is a service that is so invaluable to lumber manufacturers, merchants and consumers alike that this publication feels amply repaid in its painstaking effort in making this expenditure on behalf of its advertising clients, and will continue to keep the service corrected up-to-date at all times.

In this connection it may be noted that HARDWOOD RECORD considers itself highly complimented that the National Hardwood Lumber Association is making an attempt to duplicate this copyrighted service in pamphlet form for the benefit of its members. The association has already published its first bulletin.

It may also be noted in this connection that HARDWOOD RECORD also issues a corresponding set of bulletins covering annual requirements in veneers and panels for the benefit of that element of the lumber industry. This register to date shows the requirements of about 750 buyers.

To those who are responsible for the marketing of lumber and veneers, this service is invaluable, because from the card index system in which both are arranged, it is possible to instantly refer to the buyers of any kind of hardwood lumber, dimension stock, veneers or panels that are being consumed by the leading concerns of the country, and hence it is very easy to reach the trade directly interested in any particular item of stock that the manufacturer or merchant has to market.

Sabotage Illustrated

THE INDUSTRIAL WORKER, published at Spokane, Wash., and an organ of the Industrial Workers of the World, and further an organ particularly interested in the lumber industry, contained in a recent issue an article, entitled "Don't Do It Boys." The article is a sarcastically and rather cleverly worded "warning" to members of the Industrial Workers of the World not to indulge in what is termed "sabotage" in effecting what this organization considers justifiable action in the interests of the woods worker.

While the article is so cleverly worded that it could not technically be condemned as malicious literature, still the meaning is too easily discernible to admit of any possible misinterpretation of its purpose.

The malicious intent of the members of this infamous order, as exemplified in the particular article referred to, can best be appreciated by reading what the writer of that article considers a definition of "sabotage." As noted, it was published under the title "Don't Do It Boys," and runs as follows:

We are sure that no self-respecting lumber worker would ever resort to that terrible thing called sabotage. We wish to warn all workers against it.

You don't know what sabotage is, you say? Well, perhaps it is best to tell you so that you may take warning.

Sabotage in the woods might mean working slow on the job. You wouldn't do that, would you? Never. It is against the interest of Weyerhaeuser, Clark, Kirby and Long. You love these gentlemen, don't you?

Sabotage may mean displacing the tools where they are not easily found. Promise us that you will never do that. The day workers especially should never resort to such an infamous thing.

Sabotage may mean that logs are cut shorter than the required size. When the boss shortens your pay you should never shorten the lumber, for his daughter may desire to purchase a diseased count from across the ocean, and you know your interests are identical. What a pleasure it is to be allowed to support a count!

Sabotage may mean the driving of spikes into the logs or even into the trees. Some uncivilized loggers have threatened to drive a 20-penny spike a day for every nickel that is cut from their wages. Terrible! No

good, honest, Christian, gentlemanly logger would do anything like that. It isn't good for mill saws.

Don't use sabotage, and for your kind forbearance we feel sure that you will receive a suitable reward. The boss may be generous enough to cut your wages so as to save you the trouble of spending so much, and lengthen your hours so that the devil may find no mischief for idle hands to do.

For the love of your boss and the glory of your soul, don't use sabotage.

There surely must be some means of preventing the issuance through the mails of such literature, which is essentially and undeniably against the interests of society. While it is designed to be read only by a very limited percentage of a class of labor, which while considerable numerically, is relatively not unusually significant in its importance, nevertheless such writings illustrate one of the many insidious methods employed by the Industrial Workers of the World to stir up a feeling of class hatred, which is entirely unjustifiable and unjustified. While the bulk of the laboring body is undoubtedly made up of fair-minded and thinking citizens who will not be influenced by such rank publication, still there is a considerable element, as there is in every body of men, who are naturally attracted by the spectacular and the fire-brand arguments of men whose personalities and wills are strong enough to dominate their mind.

This element is sufficiently important to cause an inestimable amount of trouble in sawmill operations, and if the growth of such an element can be checked by a censure of its printed organ this censure should be effected.

An Experiment in Conservation

THE SINGER MANUFACTURING COMPANY is one of the largest hardwood lumber consuming institutions in the country, and in addition to its various manufacturing plants located in this and foreign countries, is a large manufacturer of lumber and veneers. This company has important timber holdings and several sawmill plants in Arkansas, and is now making

plans for an experiment in better utilization of its forest by reducing its small-sized timber, of which it has a large quantity, to core-making material.

The plans for this equipment involve logging the small timber, running from nine to fourteen inches in diameter, in full log lengths and transporting it in this form to a new plant near one of its sawmills at Trumann, Ark. At this plant the "poles" will be cross-cut to six feet lengths, which is a length rendering itself the most adaptable for the company's purposes. The bolts will be sawed into seven-eighth-inch lumber, cut "live" and unedged, and the resultant product piled onto dry-kiln trucks and steamed under pressure through a Kraetzer Preparator, kiln-dried, and then forwarded to a cutting room where the stock will be reduced to material for core stock, and built up into cores for sewing machine tables three-quarters of an inch in thickness. Then it will be shipped to the various plants in which the stock is veneered. The company proposes to use for this core stock oak, gum and other woods indiscriminately, and will start off its plant with a daily output of 35,000 feet.

This plan certainly means an increase of lumber output from small timber, the tops of large timber, etc., of well towards 3,000 feet to the acre, and is an example that can safely be duplicated by many other important hardwood lumber manufacturing houses.

A New Paper Material

FEW PEOPLE have thought of looking to the almost treeless regions of the Sudan for relief from the threatened scarcity of

UNSOLICITED TESTIMONIAL

Likes the Record

Westminster, Md., March 17, 1913.

Editor HARDWOOD RECORD, Chicago, Ill.

Dear Sir: I enjoy your paper very much. It should be read by every lumberman.

With kindest regards,

Yours truly,

H. L. FRIZZELL.

pulpwood when the aspen and spruce forests of the United States and Canada have reached their limit of supply. The material which seems to promise great things is a kind of water-weed called sudd which grows in the upper Nile, south of Egypt. Estimates which place the quantity at enough to supply the world with paper are doubtless overdrawn, as such estimates usually are, but it has long been known that sudd exists in vast quantities in the stagnant reaches of the upper Nile. For long distances it is a bar to navigation. It dams the river, causing large tracts of level land to overflow, and the submerged land produces as much sudd as the river itself. The weed takes root in the bottom of the river, but grows to the surface, where it accumulates in thick masses through which the most powerful steam tug cannot force its way. It is said (possibly it is only a traveler's tale) that the hippopotamus sometimes crosses the Nile without touching water, by walking on the thick mat of sudd.

A recent consular report gives an account of experiments having for their purpose the conversion of sudd into pulp suitable for paper. The fiber is good but the color is bad, and the difficult problem has been to bleach the sudd without destroying the fiber. It is claimed that a way has been found to do it.

The experiment took place in a demonstration laboratory at Brondesbury, England. At 12:30 p. m. the sudd was placed in a tank containing 150 gallons of bleachoid, which is obtained by an electrolytical process from a solution of common salt. Five hours later it was of a very light cream color, and, more important still, the fiber had in no way been attacked. By 8:30 the sudd had reached a creamy white shade, and in another three hours it had become a fair white. Samples were then taken, and the remainder was left in the tank overnight, and by morning it had reached a white that could be used for high-class paper making.

Whatever further results are obtained from the experimental demonstration one fact stands out prominently, namely, that sudd has been successfully bleached, and that the fiber is exceptionally strong. The next step will be to prove that, exploited on a commercial scale in the Sudan, sudd will be a paying proposition. About this there seems to be little doubt in the minds of experts. The cost of the raw material is reduced to the cost of labor; sudd fuel for the dynamo is obtainable on the spot, and salt from the Red sea.

An Awakening

PERHAPS NEVER BEFORE IN THE HISTORY of an important commercial pursuit has there been such an awakening to the frailties and inefficiency of a business as is manifested at the present time in the conduct of hardwood manufacture, grading and sale of the lumber product. President W. E. Delaney of the Hardwood Manufacturers' Association of the United States, in his address at the recent annual meeting of that organization, made the following frank statement: "I am not blind to the fact that perhaps no other industry with the importance of lumber in the commercial world is today handled with as great waste and as little intelligence as our product."

It is held by good authorities that less than fifty per cent of the forest wealth of the land is now utilized. An unholy waste and unmistakable inefficiency marks every detail of lumber production from the forest to eventual utilization. It is further held that if the steel and iron business were conducted on corresponding lines the entire industry would be in bankruptcy. Astute and thoughtful people realize that there is an altogether senseless amount of waste in lumber manufacture; that the grading systems employed are highly unscientific and crude; and that the method of sale and distribution are far from what they should be.

High costs all along the line are appalling. The high cost of logging is duplicated in the high cost of manufacture. The high cost of manufacture is duplicated in the high cost of assorting, yarding, seasoning and loading. High mill cost is again duplicated in the high cost of selling. Were it not that the timber holdings of the average lumber manufacturing concern were so nearly a free gift to the owners as to be pretty nearly regarded so, the entire industry would be in financial difficulties.

These presentations may be regarded as radical, but they are facts just the same, and the sooner manufacturers, merchants and users of lumber get down to a close study of higher efficiency, the longer the industry will be perpetuated and the more money there will be in it for those participating.

Enterprising men in this trade have already spent much thought and much money in an attempt to secure higher efficiency. Some of these attempts have been crowned with success, while other alleged economies have proven to be manifest extravaganees.

A writer on scientific business efficiency says: "The bane of many a good idea has been the intemperate zeal of its exploiters. The philosopher's passion for unity and his desire to trace all things back to the one sufficient cause seem in some degree to permeate all minds. No sooner does a man conceive a truth in his line of thought than he begins to develop it and elaborate it, until it becomes so great in his mental vision that it shuts out the whole horizon; and he is ultimately self-persuaded that if only this were adopted man's ills would cease. The name of cure-alls is legion.

"The regrettable thing about it all is that the over-zealous efforts of the would-be benefactor arouse the innate stubbornness of the prospective beneficiary, and so deprive the world of a good."

Both the pioneer and the reformer have their troubles. Pioneering in every line is expensive, and the average reformer is a nuisance, but today the manufacturer, the merchant or the eventual consumer of forest products who has not had his thoughts turned to scientific efficiency is classed as an old fogey.

Public opinion now makes it incumbent upon the real business man to investigate every new method that looks to higher efficiency, and the lowering of costs. There is more room for the study of scientific efficiency in nearly every detail of lumber production, manipulation and marketing than in most any other important commercial pursuit in this country, and it is a good sign when the astute, thoughtful men in this trade are taking up these questions one by one and attempting to solve them in the best way.

When these problems are solved it will be found beyond question that it is possible to develop two dollars from the forest where one dollar is developed today.

Venerable English Woodwork

THE OLD ENGLISH CARPENTERS used good woods and they did their work well. When they built a house they constructed it to last. This is called to mind now and then when historic buildings in England are examined. One of the latest to be brought to public notice is an old house which has stood more than 700 years near Hereford, England, and known in English local history as Rotherwas Mansion. The paneling and other interior woodwork consist of oak, sycamore, acacia and yew. There were twelve rooms finished in that way, and a comparatively large amount of wood was required, since veneers and thin boards were not fashionable when that house was built. Everything was solid and massive. One of the rooms was once a bed chamber in which James I slept in 1618.

Collectors of antiques in England are expressing concern just now because of the announcement that the woodwork is to be stripped from the interior of the mansion and offered for sale at auction. It is believed that some of it, perhaps all of it, will be bought by wealthy Americans, and that English museums will miss a valuable collection of panels, posts, capitals, and other ornaments and carvings which bear the stamp of antiquity. The objects will be welcomed in this country, particularly if the purchasers should decide to place them in museums here where modern dealers and workers in wood will have an opportunity to study the venerable workmanship of old craftsmen.

Because the price of native hardwoods has advanced considerably the past year some of the northern furniture manufacturers are talking about importing more of their cabinet woods from the Philippines. It is easier to talk about that than it is to do it, and get satisfaction out of the doing.

Pert, Pertinent and Impertinent

Joaquin Miller's Great Poem

Could I but return to my woods once more,
 And dwell in their depths as I have dwelt,
 Kneel in their mosses as I have knelt,
 Sit where the cool white rivers run,
 Away from the world and half hid from the sun.
 Hear wind in the woods of my storm-torn shore,
 Glad to the heart with listening—
 It seems to me that I then could sing,
 And sing as I never have sung before.

I miss, how wholly I miss, my wood,
 My matchless, magnificent, dark-leaved firs,
 That climb up the terrible heights of Hood,

Where only the breath of white heaven stirs!
 These Alps they are barren: wrapped in storms,
 Formless masses of Titan forms,
 They loom like ruins of a grandeur gone,
 And lonesome as death to look upon.

O God! once more in my life to hear
 The voice of a wood that is loud and alive,
 That stirs with its being like a vast beehive!
 And oh, once more in my life to see
 The great bright eyes of the antlered deer!
 To sing with the birds that sing for me,
 To tread where only the red man trod,
 To say no word, but listen to God!

A Character

The heart of life is hid from him;
 He has no ear for overtones,
 No eye for blended hues or dim;
 Therefore he learns a name for each,
 Dockets our laughter and our moans,
 And hurries forth to judge and teach—
 The heart of life is hid from him.

—Brian Hooker.

Oh Lawd if yo think we's had snow enuff,
 Will youse please tell the snow to quit snowin';
 But if yo' doan think we's had all we needs,
 Jes forgive us, O Lawd, fer complainin'.

—T. J. N.

HARDWOOD SITUATION

Both producer and consumer must stop their leaks if the tank is ever again to be filled.

Made Him Sick

Here is a conversation overheard in the elevator of a New York skyscraper between a fussy old lady and the runner:

"Don't you ever feel sick going up and down on this elevator all day?" was the solicitous woman's first question.

"Yes'm," courteously replied the elevator boy. "Is it the motion of the going down?" she wanted to know.

"No'm," answered the boy.

"The going up?" she continued.

"No'm," he again replied.

"Is it the stopping that does it?" she persisted.

"No'm."

"Then what is it?"

"Answerin' questions, Ma'am."

Consoling

"You will be the victim of a fatal accident."

"Good gracious!"

"Calm yourself. It won't happen until the end of your life."—*Péte Mêle.*

"Promises, like pie-crusts, are easily broken," said a philosopher. But he said it before the railway lunch-counter pie was invented.

A Fair Exchange

The little boy sat by the roadside idly poking the warm dust with his bare toes. When the big man came along the little boy looked up and said:

"Mister, is this your park?"

"What'll you gimme for it?" quizzed the big man.

"Fourteen hunderd thousan' milyun dollars," replied the little boy.

"All right," smiled the big man; "just take it right along with you."—*Youngstown Telegram.*

American Forest Trees

ONE HUNDRED-SIXTH PAPER

WESTERN LARCH

(*Larix Occidentalis-Nutt*)

This tree of the northern Rocky Mountain region is of splendid size and symmetrical proportions. Specimens sometimes are two hundred and fifty feet high and six or eight feet in diameter, but the average size is less than half of these figures. Its range lies in Oregon, Washington, and on the upper tributaries of the Columbia river in Idaho, Montana, and British Columbia. It is a limby tree early in life, but later it successfully shades off its lower limbs and a long tapering bole is developed with a very small crown of this foliage. No other tree of its size, with the possible exception of old sequoias, has so little foliage in proportion to the size of the trunk.

The larch is a needle-leaf tree but not an evergreen. Like its eastern cousin, the tamarack, its leaves fall in autumn and the branches are bare until the next spring when little tufts of soft, green needles put in an appearance, springing from wart-like excrescences on the branches. These knobs or warts, about a quarter of an inch across, assist in identifying the tree when the leaves are down. The little excrescences are interesting objects of study. They are stunted twigs which are unable to increase in length but remain as buttons, with all the needles crowded at the ends. The twig which develops on the larch is the terminal shoot. It is clothed all the way down with leaves, there being no occasion for them to crowd on the end as is the case with those which are unable to attain a length of more than a quarter of an inch.

The larch's very small crown, in comparison with the size of its trunk, shows results in the rate of growth after the period of youth has passed. Sometimes such a tree does not increase its trunk diameter as much in forty years as a vigorous loblolly pine or willow oak will in one year. The trunk of a tree, as is well known, grows by means of food manufactured by the leaves and sent down to be transformed into wood. With so few leaves and a trunk so large, the slowness of growth is a natural consequence. Though the annual rings are usually quite narrow, the bands of summerwood are relatively broad. That accounts for the density of larch wood and its great weight. It is six per cent heavier than long-leaf pine, and is not much inferior in strength and elasticity. The leaves are from one to one and three-fourths inches long, the cones from one to one and one-half inches, and the seeds nearly one-fourth inch in length. The latter are equipped with wings of

sufficient power to carry them a short distance from the parent tree.

The bark on young larches is thin, but on large trunks, and near the ground, it may be five or six inches thick. When a notch is cut in the trunk it collects a resin of sweetish taste which the Indians use as an article of food.

The western larch reaches its best development in northern Idaho and Montana on streams which flow into Flathead lake. The tree prefers moist bottom lands, but grows well in other situations, at altitudes of from 2,000 to 7,000 feet. The figures given above on this wood's weight, strength and stiffness show its value for manufacturing purposes. Its remoteness from markets has stood in the way of large use, but it has been tried for many purposes and with highly satisfactory results. In 1910 sawmills in the four western states where it grows, cut 255,186,000 feet. Most of this is used as rough lumber, but some is made into furniture, finish, boxes, and boats. The wood has several names, though larch is the most common. It is otherwise known as tamarack and hackmatack, which names are oftener applied to the eastern tree, red American larch, western tamarack, and great western larch.

Some of the annual cut of lumber credited to western larch does not belong to it. Lumbermen have confused names and mixed figures by applying this tree's name to noble fir, which is a different tree. If the fir lumber listed as larch were given its proper name, it would result in lowering the output of larch as shown in statistical figures. In spite of this, however, larch lumber fills an important place in the trade of the northern Rocky Mountain region.

There is little doubt that it will fill a much more important place in the future, for a beginning has scarcely been made in marketing this timber. The available supply is large, but exact figures are not available. Some stands are dense and extensive and the trees are of large size and fine form.

It is not supposed, however, that there will be much after the present stand has been cut, because a second crop from trees of so slow growth will be far in the future. Sudworth says that larch trees from eighteen to twenty inches in diameter are from 250 to 300 years old, and that the ordinary ages of these trees in the forests of the Northwest are from 300 to 500 years; while larger trees are 600 or 700. Much remains to be learned concerning the ages of these trees in different situations and in different parts of

TYPICAL FOREST GROWTH, WESTERN LARCH, WHITE FISIL, MONTANA

the range. It is apparent, however, that when a period covering two or three centuries is required to produce a sawlog of only moderate size, timber owners will not look forward with much eagerness to second growth forests of western larch.

The value of this wood has been the subject of much controversy. In the tables compiled for the Federal census of 1880, under direction of Charles O. S. Sargent, its strength and elasticity were shown to be remarkably high. The figures indicate that it is about forty per cent stronger than white oak and fifty per cent stiffer. This places it a little above longleaf pine in strength and nearly equal to it in stiffness or elasticity. Engineers have expressed doubts as to the correctness of Sargent's figures; they believe them too high. The samples tested by Sargent were six in number, four of them collected in Washington and two in Montana.

The wood of western larch is heavier than longleaf pine, and approximately of the same weight as white oak. It is among the heaviest, if not actually the heaviest, softwoods of the United States. Sargent thus describes the physical properties of the wood: "Heavy, exceedingly hard and strong, rather coarse-grained, compact, satiny, susceptible of a fine polish, very durable in contact with the soil, bands of small summer cells broad, occupying fully half the width of the annual growth, very resinous, dark-colored, conspicuous resin passages few, obscure; medullary rays few, thin; color, light bright red, the thin sapwood nearly white." The wood is described by Sudworth: "Clear, reddish brown, heavy, and fine-grained; commercially valuable; very durable in an unprotected state, differing greatly in this respect from the wood of the eastern larch."

The seasoning of western larch has given lumbermen much trouble. It checks badly and splinters rise from the surface of boards. It is generally admitted that this is the most serious obstacle in the way of securing wide utilization for the wood. The structure of the annual ring is reason for believing that there is slight adhesion between the springwood and that of the late season. Checks are very numerous, parallel with the growth rings, and splinters part from the board along the same lines. Standing timber is frequently wind-shaken, and the cracks follow the rings.

All of this is presumptuous evidence that the principal defect of larch is a lack of adhesion between the early and the late wood. If that is true, it is a fundamental defect in the growing tree, and is inherent in the wood. No artificial treatment can wholly remove it. It should not be considered impossible, however, to devise methods of seasoning which would not accentuate the weaknesses natural to the wood.

The form of the larch's trunk is perfect, from the lumberman's viewpoint, and its size is all that could be desired. It is amply able to perpetuate its species, though it consumes a great deal of time in the process. Abundant crops of seeds are borne, but only once in several years. It rarely bears seeds as early as its twenty-fifth year, and generally not until it passes forty; but its fruitful period is long, extending over several centuries. The seeds retain their vitality moderately well, which is an important consideration in view of the tree's habit of opening and closing its cones alternately as the weather happens to be damp or dry. The dispersion of seeds extends over a considerable part of the season, and the changing winds scatter them in all directions. Many seeds fall on the snow in winter to be let down on the damp ground ready to germinate during the early spring. The best germination occurs on mineral soil, and this is often found in areas recently bared by fire. Lodgepole pine contends also for this ground but the race between the two species is not swift after the process of scattering seeds has been completed; for both are of growth so exceedingly slow that a hundred years will scarcely tell which is gaining. In the long run, however, the larch outstrips the pine and becomes a larger tree. If both start at the same time, and there is not room for both, the pine will kill the larch by shading it. The latter's thin foliage renders it incapable of casting a shadow dense enough to hurt the pine. The best areas for larch are those so thoroughly burned as to preclude the immediate heavy reproduction of lodgepole pine.

Many of the natural ranges of larch and lodgepole pine lie in the national forests owned by the government, and careful studies have been made in recent years to determine the requirements, and the actual and comparative values of the two species. It has been shown that larch is one of the most intolerant of the western forest trees. It cannot endure shade. Its own thin foliage, where it occurs in pure stands, is sufficient to shade off the lower limbs of boles and produce tall, clean trunks; but if a larch happens to stand in the open, where light is abundant, it retains its branches almost to the ground. It is more intolerant, even, than western yellow pine, which so often grows in open, park-like stands, and that habit has had much to do with the form and value of larch timber.

Confusion of Common Names Sometimes Serious

The following paragraph is copied from a report prepared by an American college professor, who is now in Brazil making a study of the timber resources of that country:

"*Cedro clara* (*Cedrela brasiliensis*) Meliaceæ. Like the cedars of the United States, this wood is light, not too strong perhaps, but adapted to all the uses common to our cedar, like the making of lead pencils. It is used here, very extensively, for posts, because of its resistance to weather. It is very common all over Brazil and will soon form an important article of commerce. The trees are sometimes immense, but the wood appears sound and as valuable as that from smaller specimens. As to lead pencils, it is to be noted that there is an extensive though at present unworked mine of plumbago in the state of Ceara close to an extensive forest of this wood, and that, too, with plenty of undeveloped water power at hand. Who will make the combination and at the same time a fortune?"

It would be difficult to find more errors combined in a single paragraph than appear in this one, which was intended to inform lead pencil manufacturers of the nature of a wood designed to take the place of our gradually diminishing pencil cedar. It is quite evident that the author of this report on Brazilian woods did not examine very closely the wood of this "cedro clara" or he would have observed that it does not at all resemble the pencil cedars indigenous to the United States. Such mistakes and confusions are the direct result of popular plant naming, and it may be worth while to give here the reason why the name "cedar" has come to be applied to these unrelated tropical hardwoods (*Cedrelas*). The Spanish cedar (*Cedrela odorata*) has a characteristic odor resembling the cedars (*Juniperus*, *Thuja*, *Libocedrus*, etc.) of the United States, and for this reason it was called cedar or "cedro" by the early Spanish settlers in the American tropics. In order to distinguish it, however, from the true cedars it is generally referred to as Spanish or cigar-box cedar, or "cedro clara" in the case of the Brazilian species. There are more than a dozen species of the genus *Cedrela* and all closely resemble the Spanish cedar and are generally called "cedro."

The Brazilian species, which is an important tree and has an extensive distribution, yields a wood that is used for every purpose for which the Spanish cedar is employed, but so far as American and European pencil manufacturers are concerned, it has never been available for use as a lead pencil wood. Here is, therefore, a case in which the author of the report has failed to realize that though of the same name these woods possess entirely different characters from those of our native cedars, all of which are soft woods, that is to say, woods of the cone-bearing trees. This confusion of knowledge of common names of trees and the lack of understanding the structural relations of the different woods led to very misleading statements. The proposition as outlined by the college professor is a very tempting one for those who dare to venture on a project with as little definite knowledge as contained in the above extract. While the combination of extensive supply of plumbago, timber and water is easily made, the fortune is probably not so readily attained.

L. L. D.

An Analysis of Durability

Durability as applied to wood, broadly defined, means the ability to resist decay or, more specifically, it is the length of time which a piece of wood under given conditions resists the influences of decay. Durability is frequently the determining factor in the value of timbers for certain purposes and is also a prerequisite along with other technical qualities for many uses. For instance, railway sleepers must not only be durable but must be sufficiently hard, tough and strong to resist the impact and wearing strain of the heavy traffic on the rails. The length of life in the purpose which they serve determines the relative value of timbers used for telephone and telegraph poles, piling material for wharves and foundations, posts, ties, shingles, sills, structural material and many other uses to which wood is put. Not only does durability apply to wood used in contact with the soil but also to practically every way in which wood is used where it is subject to deteriorating influences.

All kinds of wood are durable under certain conditions. Whenever the three elements of heat, moisture and oxygen are absent, either collectively or individually, wood will last indefinitely. For instance, if timbers are submerged underneath the surface of the ground or water there will be no decay possible. Piles of the ancient lake dwellers in parts of Europe that must have been driven at least two thousand years ago have been unearthed and found to be intact. Pieces of pine of unknown age in good condition have been dug up from holes sixty feet in the earth in the Central West. It is reported that some old piling that Caesar used in crossing certain rivers of France have been exposed and found to be in splendid condition.

On our lumber markets the durability of certain species is recognized by the high prices which they command. There is seldom, however, an understanding of the qualities which determine that particular characteristic. Prices are usually directly dependent upon the lasting qualities for certain purposes such as ties, wagon bottoms, poles, structural timbers, etc.

Whenever the influences of decay as mentioned are removed, the duration of the life of wood is indefinite. Moisture and oxygen may be present, but if heat is absent timbers will not decay. It is the constant change of heat and moisture conditions in our atmosphere that determines largely the life of most of our timbers. For instance, furniture in a house will last indefinitely or until it wears out or breaks apart—decay does not set in because of the even temperature conditions and the absence of moisture. Wood in damp places rots readily because of the presence of both moisture and heat, which together with oxygen in the air are conducive to the growth of minute organisms. This explains why beech furniture will last indefinitely, while beech ties will only last from three to five years. This also explains why timbers last a great deal longer in dry, hot climates such as in the desert regions of the Southwest than they do in the East, where there is greater relative humidity in the air, greater precipitation and greater seasonal changes of climate.

In discussing the relative durability of timber, therefore, we may divide the influences of decay into two broad divisions,—the external and the internal influences.

EXTERNAL INFLUENCES OF DECAY

The principal external influence of decay consists of literally hundreds of minute living organisms called bacteria and fungi.

These cause not only the usual rotting of timbers before being cut in the forest but also those after being manufactured and utilized. The common names applied to the various forms of this decay are "dry rot," "red rot," "punk," "peckiness," "bluing," etc. The external evidence of these fungi are the fruiting bodies, commonly occurring in shelflike form which scatter their microscopical seeds, called spores, through the air to other wood. These spores develop into living organisms, spread out and form a perfect network in the wood, dissolving the woody structure and cell contents for food and for their further propagation. In

the case of "bluing" the fungus confines itself to consuming the starch in the cells and merely leaves a stain. Some fungi attack only certain conifers, others confine themselves to hardwoods. Occasionally some varieties confine their depredations to a single species, but more usually propagate on a variety of woods. Some work from the sap inwards and others attack the heartwood first and cause the heart-rot so common in some of our trees. The timbers that are most susceptible to attack are those that on account of warping or checking or through some fire scar or mechanical injury, have a fissure opened in the wood fibers for the entrance of the fungi. This is the reason why it is well to apply an external preventative or preservative such as corrosive sublimate (mercuric chloride) to prevent sap staining.

Fungous growths are retarded by cold temperatures and by lessening the moisture content. This is why timbers are more susceptible to decay by rot in the South than in Minnesota, for example. It also explains why seasoned lumber is less readily attacked by fungi. If the moisture content can be maintained at less than ten per cent, timbers are immune from decay. Extreme heat or temperatures over 150 degrees F. also kill or prevent the further development of fungous growths. It is said that temperatures of from 65 degrees to 100 degrees F. are most conducive and favorable to the spread and injurious effects of these organisms. Wood, however, exhibits a strong absorptive ability and after kiln-drying, lumber should be kept as dry as possible to prevent the re-entrance of moisture in the fibers and a consequent susceptibility to fungous attacks.

Besides the external influence of living organisms, the presence of water in the soil, the physical characteristics of the soil and the condition of the atmosphere all have a strong bearing on the durability of timbers. If a pole or post is kept in a constantly moist or wet soil it will last much longer than if placed in an alternating dry and wet soil. This is equally true of changing atmosphere and explains why a tie, placed partly beneath the ground, will check badly. In a stiff clay soil a pole or post usually rots at the ground line, whereas in a sandy or porous soil the wood will be affected down to its base. Some fungi attack the heart first and the wood is rotted gradually from the center out, and in others the reverse is true. However, the sapwood generally decays and rots away first, owing to the greater per cent of moisture contained in it and therefore to the fact that it is more inviting to the work of the decaying influence. Wood painted or tarred before proper seasoning is likely to be attacked by "dry rot," for the spores of the fungus are sure to be present and are protected from the drying out process so that they can do their work quicker than if the wood were not painted. Charring posts prevents decay because the charcoal resists the solvents of fungi and prevents its spread into the wood.

Durability is also determined to a certain extent by the method of usage and by external wear and tear. For example, paving blocks are laid with their transverse sections upwards because the radial or tangential faces are more susceptible to wearing.

Insects, beetles, etc., also have a certain relation to durability but are a mechanical influence which presents a different problem. The powder post beetle is the most prominent of the group and works considerable damage through its attacks on the sapwood, particularly of such woods as hickory, oak, ash, etc. The teredo or marine borer is also a powerful enemy of our wharf piling and determines the life of timbers used in salt waters in the warmer climates.

INTERNAL INFLUENCES OF DECAY

The internal influences which determine the rate of decay of timbers are largely chemical rather than physical. It has been demonstrated that there is no direct correlation between the principal physical characteristics which go to make up the value of woods used where durability is not a determinant factor. Thus weight, strength, stiffness, hardness, toughness, elasticity, etc., do

not apparently exert any influence upon the lasting qualities of timbers other than to offset the effects of abrasion, impact and other influences of wear and tear. In these cases it is apparent that specific gravity and hardness are important; but in discussing durability the chief consideration is the duration of life under ordinary conditions of usage. To illustrate the above, hickory and hard maple, two of our hardest and heaviest of woods (specific gravity 84 and 69 respectively), are classed among our perishable woods. The American elm, our toughest common wood, is also short-lived when brought into contact with the soil or under the presence of usual atmospheric changes. Four of our weakest and softest woods, redwood, northern white cedar, western red cedar and catalpa, may be classed among the most durable. These are also some of our lightest woods, having specific gravities respectively of .21 (*Sequoia washingtoniana*), .32 (*Thuja occidentalis*), .38 (*Thuja plicata*) and .42 (*Catalpa speciosa*).

The principal internal influences which determine durability, therefore, must be found in the chemical constitution of the wood. In this respect, coloration, particularly of the heartwood, is the best direct outward evidence of the chemical nature of the durability of wood fibers. What, then, determines coloration? This is to be found in the relative amounts of tannin contained in the wood elements. Besides tannin, the resins, gums and other similar compounds found in wood are antiseptic in their nature and therefore have a direct bearing on the durable qualities of the wood in which they are contained. A German investigator, Heinrich Mayr, states that the more intense the color of heartwood the more durable it is. This is easily borne out by mentioning some of our species of deeply colored heartwood, the durable qualities of which are well known—ebony, lignum-vitæ, rosewood, catalpa, red cedar, the sequoias or redwoods, black locust, Osage orange, yew, etc. As opposed to these, some of our common species with a light-colored heart are among our most perishable woods, namely, horse chestnut, basswood, maple, cottonwood, tupelo, hickory, spruce, balsam, etc. To be sure, there are exceptions to this general rule, but, as with most rules, they only help to prove it. Tannin is formed by oxidation in the tissues in the zone between the sapwood and heartwood as the water gradually disappears from the cells and oxygen is admitted. The gradual darkening of the heartwood after being cut and exposed to the atmosphere is a good illustration of the process of oxidation. Color is to a certain degree dependent upon illumination of the foliage of the tree. Hence, color is deepest in the branches near the point of illumination, not so deep in the bole of the tree and even more pale in the roots. Wood from trees grown in full sunlight is more deeply colored than that from those in a dense forest and is therefore likely to be more durable. In this same connection, tropical woods are likely to be more durable than those grown in a more northerly climate; so that trees from the same species are more durable when grown in the southern than in the northern extremity of its range. Chestnut wood contains from five to ten per cent of tannin. Turpentine, one of the ethereal oils of wood, becomes oxidized into rosin, which adds considerably to the durability. The added presence of gums is a great factor in rendering wood antiseptic against the bacterial and fungous influences of decay.

Sapwood is obviously less durable than heartwood, both on account of its saturation with moisture and its lack of protective chemical constituents such as tannins, resin, gums, etc., which are usually found in heartwood. The writer has seen cypress and tupelo logs unearthed from a vegetative covering in the swamps along the Choctawatchie river in Florida that, with the exception of the sap which had rotted off, were perfectly sound and yielded splendid grades of lumber. Larch logs have also been uncovered in northern Idaho, that were lying prostrate along the ground under western red cedar trees that were up to 150 years of age. Only the thin sapwood had rotted off, probably before the covering which excluded the oxygen was complete.

There is no direct interrelation between rapidity of growth and durability except within a species. That is, a rapidly grown piece of oak is not likely to be as durable as one which grew much

slower, yet species which inherently grow rapidly, such as black locust, catalpa and chestnut, are found to be durable as well as slow-growing trees, such as longleaf pine, cypress, red cedar, etc. What makes one species more durable than another can only be explained by its inherent qualification to have contained within its heartwood those chemical elements which resist the influences of decay.

The above discussion has been devoted to the question of natural durability. Artificial durability as applied to timbers has been introduced as a result of the growing scarcity and consequent rise in value of our forest products. This is a big subject and although closely allied to the question of durability, the preservation of timbers by artificial means deserves consideration by itself. Suffice it to mention the principal means of increasing the natural durability of wood, which are special methods of seasoning (such as steaming and smoking), charring the surface of wood that is brought into contact with the soil, painting, tarring and the impregnation of chemical preservatives into the wood fibers.

The state forester of Ohio has recently published the result of an exhaustive investigation of the relative durability of several species used for post material, under a wide range of conditions. This list shows the following species, given in order of durability: Osage orange, black locust, red cedar, mulberry, white cedar, catalpa, chestnut, white oak and black ash.

The following list is offered to show the comparative durability of some of our American timbers by groups. This is not presumed to obtain for all conditions, because it is too well known that there is a considerable lack of uniformity in the durable qualities of woods even within the same species and under similar conditions of placement.

VERY DURABLE

HARDWOODS.	CONIFERS.
Black locust.	Incense cedar.
Catalpa.	Cypress.
Mahogany.	Western yew.
Osage orange.	Arbor vitae.
Mulberry.	Western red cedar.
Chestnut.	Redwood.
Black walnut.	Southern white cedar.
Live oak.	Lawson cypress.
Sassafras.	

DURABLE

White oak.	Longleaf pine.
Post oak.	Cuban pine.
Black ash.	Eastern larch.
Honey locust.	Western larch.
Cherry.	Douglas fir.
Persimmon.	
Red elm.	
Bur oak.	

INTERMEDIATE

Yellow poplar.	White pine.
Red ash.	Norway pine.
Red oak.	Sugar pine.
Scarlet oak.	Shortleaf pine.
Butternut.	

PERISHABLE

Cottonwood.	Loblolly pine.
White elm.	Red spruce.
Red gum.	Hemlock.
Hard maple.	Western hemlock.
White ash.	Sitka spruce.
Black oak.	Noble fir.
Red birch.	Englemann spruce.
Beech.	Pitch pine.
Hickory.	
Cucumber.	

VERY PERISHABLE

Black gum.	Lodgepole pine.
Water gum.	Jack pine.
Basswood.	White spruce.
Buckeye.	Balsam fir.
Sycamore.	White fir.
Grey birch.	
Paper birch.	
Aspen.	
Willow.	

WASTE IN CUTTING GUM FOR COOPERAGE

WASTE IN THE MANUFACTURE OF STAVES AND HEADING

Sources of Hardwood Waste

“Slack cooperage stock” is the term applied to the material or parts used by coopers in assembling slack barrels, kegs, hogsheads, tubs, kits and firkins, and includes staves, heading and hoops. In general, slack cooperage stock is distinguished from that of tight cooperage by the fact that the receptacles made from it are not intended for holding liquids. There is a wide range, however, between the character of slack cooperage receptacles and those which will hold firm, solid substances like vegetables to fine, powdery substances such as flour.

The waste resulting from the manufacture of cooperage stock is generally conceded to be greater than that from the manufacture of any other product. It is estimated by one investigator that as much as forty-five per cent of the material for staves and hoops and seventy-four per cent of that for heading is not used. Owing, however, to the low grade of material which it is possible to utilize in some parts of the industry, material which would in many cases be a total loss unless so utilized, the matter is not as serious as the figures would indicate. A considerable part of this waste could be prevented, and as values increase with decreased supply of material, utilization will become more nearly complete.

The nature and extent of the waste depends upon whether it occurs in the yard or in the mill. The greatest waste occurs in the woods and is due to carelessness and lack of supervision. High stumps and excessively long top sections are responsible for the loss of from one to several stave or heading blocks on a large proportion of the trees cut by some operators. Often knotty logs with considerable merchantable material in them are left on the ground to decay. It is best to work up timber as soon as possible after it is cut, because then it is more easily worked, stands better the strain of bending and looks brighter. This is an important point which is often neglected, and hundreds of logs are wasted because they are left too long in the woods or in the yard, and thousands of staves are shaky, dull and brash, because they are made from that kind of trunks. Red gum logs in particular are very liable to sap stain if cut in summer and left in damp situations for a time. This is not due to any greater sap content but to the more favorable conditions for the development of fungi.

A loss which amounts to a great deal in the aggregate is due to improper cutting lengths of the logs. As summed up by the National Conservation Commission: “Logs intended for staves are cut in the woods to lengths which are multiples of thirty-two inches, because of poor judgment of the workman or wood superintendent, and it is often found necessary to utilize at the mill

for heading material which was cut in the woods for staves. In logs which were cut for six-stave lengths the waste, if it is found necessary to utilize this for heading, is three inches to the log. If, on the other hand, the log were cut for five-stave lengths, the waste, if it is found necessary to use this for heading, is thirteen inches. Not infrequently, through carelessness of workmen, logs are cut too short in the woods and the last block must be thrown out at the mill.”

A large majority of the manufacturers of slack cooperage stock specialize in making only one of the parts of which a barrel or other receptacle is composed. Thus one establishment will make staves, another heading and another hoops. A few concerns make two of these parts, but rarely are all three produced by the same concern. One reason for this condition is that the different parts require different kinds of wood and usually all three kinds are not available to one plant. This is unfortunate, for it is to this specializing that much waste is due. For instance, logs that will not make good hoops will frequently make good staves and logs or portions of them which are not suitable for staves will often make very good heading. Where the industries cannot be combined it would appear good business to include other manufactures to utilize the odds and ends left over. When timber is cheap, however, the increased cost of articles made from scraps will usually more than offset the saving in the cost of material, making such side lines impracticable.

It is the usual practice in making slack staves and heading to cut the log into blocks in the mill and then saw them into bolts. In some mills, however, the whole log is first sawed into quarters or sixths and these long bolts are then cut into stave or heading lengths by a small cut-off saw. This is inadvisable, since each block should be handled separately if bolts are to be secured from which prime staves can be cut. The method of first quartering the whole log before cutting into blocks does not take into account variations in the grain and provides no way for tipping and turning the log to get the bolts into the best form.

The bigger the log the greater the percentage of No. 1 staves that can be obtained from it, and since it costs as much to manufacture No. 2 staves as it does the best quality, small logs are not in great demand. If too small to quarter they will produce too many “washboards.” This fact tends to increase the waste in the woods unless the stave mill also makes heading, because considerably smaller logs can be used for heading than are practicable for staves. Since nearly all slack cooperage staves are

RED GUM LOGS DAMAGED BY FUNGI BECAUSE LEFT TOO LONG IN THE WOODS AFTER CUTTING

OAK LOGS CHECKED BECAUSE THEY WERE ALLOWED TO LIE TOO LONG BEFORE THEY WERE CUT

cut with a knife and not sawed from the bolts, there is a minimum of waste from that source.

It is rather unusual for bolts to be split, though this method assures straight-grained stock, while the straightness of grain of sawn bolts depends upon the skill of the man at the bolting saw. Any advantage due to splitting is far outweighed by the excessive waste which results in cutting the staves, as the first two and last two staves from every split bolt must be culled because the sides of the bolts are so uneven. A comparative test of the two methods was made by a manufacturer in New York state, who found that nine cords of sawn bolts gave 12,000 $\frac{3}{8}$ -inch staves, while an equal amount of split bolts furnished only 10,000 staves of the same thickness.

The stave cutter is or should be the most skilled employe in a cooperage mill, because he must know how to handle each individual bolt so as to get the best quality of staves in the shortest time. At best there are numerous staves thrown out because too defective to go into the regular grades. The number of such staves increase in inverse ratio with the skill of the cutter. They are generally used for fuel, though sometimes they are shortened for kegs or part of them may be used to cover the stave piles in the yard. An unavoidable waste at the stave knife occurs from the thin slabs that are left and which are usually used for fuel.

When staves are fresh from the cutter they are saturated with water due in part to the greenness of the wood and also to the steaming process which softens them. It is necessary that they be dried quickly to prevent mold but not so rapidly that they would be badly checked and warped. In piling the staves the piles should be located on dry ground and should have air holes at the bottom and openings at the top to allow a free circulation of air. The individual piles should be separate and arranged parallel. In no case should the staves be put directly on the ground, and the upper tier should be covered with culled staves, bark or a roof to afford protection from sun and rain. This will preserve the bright appearance which is so essential in certain branches of the trade, such as flour and sugar barrels.

Warping and loss of circle can be prevented by choosing a ply suitable to the weather conditions and to the tendency of the species to warp. Care should be exercised to keep the pile perfectly level up to the top layer, which may serve as a roof to shed the rain. Since loss of circle is most likely to occur when the staves are fresh from the knife the plan is sometimes followed of setting the staves loosely on edge for from a few days up to a couple of weeks before placing them in the regular piles. This increases the cost somewhat but very satisfactory results are obtained.

After staves have been air-dried for sixty days or more, depending upon the locality and the season of the year, they are jointed

or trimmed so as to have proper bilge and smooth edges. If the staves are not thoroughly seasoned the joint is liable to warp and twist upon subsequent drying. The work of the jointer is very important, but too often he is not as careful as he should be and occasions excessive waste in trimmings or "listings," as they are called, or by poor grading. Some woods are very hard to cut and may contain knots, and there is a strong temptation for the jointer to throw imperfect staves in the fuel pile, whereas with a little more work and care the knots could be cut off and merchantable staves secured. For instance, at a mill in Michigan out of two lots of 17,000 staves each, 3,000 and 2,500 staves, respectively, were culled, a considerable number of which the jointer admitted could have been saved.

In sawing heading it is a common practice first to pull the bark off the blocks by means of a rosser knife. In some mills, however, the blocks are sawed with the bark on and then passed through an old stave-jointing machine to trim the edges. By this method it is claimed that the boards have better edges, occupy less space in the kiln; are easier to joint later, and the work can be done chiefly by a boy and an old machine. It has also been suggested that heading be surfaced before kiln-drying, as it is easier done then and is believed to hasten drying.

Sawn heading boards are piled in the yard to air-season for from sixty to ninety days before going into the kiln. Not infrequently, however, rush orders make it necessary to dispense with the air-seasoning, and in the case of the denser hardwoods there is likely to be considerable loss from checking and warping. This can be overcome, in part at least, by proper regulation of the drying by means of moist air and low temperatures at first. As an example of the loss sometimes sustained may be mentioned the statement of a mill superintendent in New York to the effect that heading boards dried in the yard and then in the kiln would average eighty per cent No. 1, while if dried in kiln direct from the saw only fifty per cent No. 1 would be secured. This is explained by the fact that wood is a very poor conductor of heat and if green material is exposed to a hot, dry atmosphere the evaporation from the surface will be very rapid, while that of the interior will follow slowly. For this reason, shrinkage, which always accompanies drying, proceeds irregularly and the fibers are torn apart. By regulating the humidity of the air in the kiln the evaporation can be retarded until the wood is heated through and through, so that subsequent loss of moisture will be gradual and the shrinkage uniform.

To secure good work at the heading jointer it is important to see that the wheel is kept free from sawdust, that all parts are equally balanced, that the knives are of equal sharpness and the handling is always careful. When hardwoods are used it is often difficult to obtain tight joints when matched, making it desirable

to combine a soft material like lasswood with a harder such as maple. Tying crates of heading with wire instead of tin strips often causes damage by cutting into the wood.

The common method of sawing heading boards is "through and through," except in the case of large logs which are first quartered. In small logs with a defective core the middle boards are too narrow for good heading. This can be overcome by cutting boards from three sides, leaving a three-cornered piece at the middle. It requires more time, however, than the usual method, but wider boards are secured.

One of the principal sources of waste is in turning heading, the loss amounting to from twenty-five to thirty per cent of the volume of the heading boards. Most of this appears to be unavoidable. There is also waste from cutting twenty-one-inch lengths when heading only nineteen inches or less in diameter is to be circled out. Some oversize is desirable in order to avoid season checks at the ends. There is also a waste of at least one heading board for every block, due to inability to hold a thin slab against the saw.

There is the same need for care in piling heading as in staves. The piles should be open enough to permit a ready circulation of air, should be raised off the ground, should have air spaces between them and be covered. Many a pile of good heading has been ruined or badly damaged by mold through failure to take proper precautions.

Three kinds of wooden hoops are used in slack cooperage production, namely, "patent" hoops, which are either cut or sawn from planks (usually elm) by special machines; flat or "racked" hoops, which are split in flat layers from black ash; and round hoops, which are made by dividing young saplings of a tough and pliable nature like hickory, birch, beech and maple. Only the "patent" hoops will be considered here.

A better grade of timber is required for the manufacture of hoops than for staves and heading. There is only one grade of hoops, while there are at least three for staves and heading. Consequently the presence of knots and defects causes material to be sent to the scrap pile which could be utilized for staves or heading if the mills were equipped to handle it. Hoop blocks are at least six feet long and a knot in a plank causes a strip of equal width and six feet long to be wasted. In cutting up logs for hoops if there happens to be a piece less than six feet long it is culled, though it would probably make first-grade staves or heading.

Imperfect hoops and those broken in coiling are usually consigned to the scrap pile. In some mills, however, this material is made into head liners. This is accomplished by passing them through a machine which saws them in two lengthwise and leaves them with the proper curve. One company figures its daily net profit from this source at \$3.50.

Hoops are air-dried after being coiled and care has to be taken that the coils are properly piled if mold is to be avoided. Hoops from sapwood appear to be most subject to mold and under conditions favorable to the development of fungi will become spotted within less than a week. The coiled hoops should be placed in piles raised off of the ground and shedded over to keep out rain. Kiln-drying is not practiced because it seems to reduce the pliability of the hoops and to render them more liable to break.

The foregoing suggestions are made with a view of stimulating interest in the closest practicable utilization of timber in the slack cooperage business. Some plants are already doing all that could be desired, but others are not yet practicing the various economies which make for increased efficiency and profits, and prolong the present supply of material. There is room for considerable practical reform along that line.

J. R. S.

Eliminating One Loss at the Sawmill

A German importer of American hardwoods took occasion recently to "roast" lumber manufacturers in this country for their waste of material for the sake of securing quantity output. He declared that logs shot through mills in the United States are literally "chewed up," and that the loss in the woodworking factory or planing mill, when the varying thickness of badly manufactured boards has to be equalized, more than offsets the possible saving made through reducing labor expenses by getting a maximum production at the sawmill.

There is a good deal of truth in the criticism, though it is probable that a considerable exaggeration was indulged in in dealing with conditions over here. Of course, the small country mills which operate more with regard to cutting the logs up than with turning out perfectly manufactured stock, are to blame for putting on the market a lot of extremely poor lumber; but when it comes to high-grade quartered oak, for instance, there is comparatively little loss of the kind complained of.

On the other hand, some lumbermen are rather careless in another way that is almost as serious as the one referred to. That is in cutting lumber thicker than is really necessary. The allowance for shrinking in seasoning is usually over-conservative, and a manufacturer operating a large mill in the Central South conceded not long ago that he was losing several thousand dollars a year because of cutting his oak thicker than the situation demanded.

It is an interesting fact that there are few accurate statistics available on the subject of loss of thickness from drying. Consequently each lumberman has to be his own arbiter in the matter, and the results obtained by experience are depended upon altogether. Of course, such results are usually more satisfactory than any other kind, but they involve a certain amount of incidental expense during the time that experimentation is in progress. And if this element of expense can be eliminated, so much the better for the lumberman.

The chief trouble about using other people's figures on a proposition of this kind is that they are not always correct, as far as the conditions of the user are concerned. That is to say, an Indiana lumberman cutting quartered oak might find that $1\frac{1}{16}$ -inch was sufficiently thick to enable him to take care of shrinkage during the full drying period of from four to six months; while a southern manufacturer who tried that experiment possibly would find that he had allowed too little, and that he was shipping oak that didn't measure an inch full. And it is rather embarrassing to have a car of lumber turned down because of being a "scant inch" in thickness when the buyer wanted a full or "plump" inch to work on.

In fact, some southern mills, in order to be on the safe side, allow as much as $\frac{3}{16}$ -inch, or in extreme cases $\frac{1}{4}$ -inch on their quartered oak, finding that the liberal allowance is none too much when the stock is going to dry out for a considerable period; for of course the length of time it is to remain on sticks will have a good deal to do with it. Some stock which is kept longer than had been anticipated might lose a trifle more than the allowance, although this is usually figured on a basis which will take care of about all of the shrinkage which will result from the drying process.

On the other hand, there are lumber manufacturers with mills in the South who insist that $\frac{3}{32}$ -inch is a sufficient allowance for shrinkage, and that making twice this allowance, as indicated above, is simply throwing that much lumber away, as far as its value to the manufacturer is concerned. Here again it is evident that the millmen might compare notes to advantage and make their decision as to the dimension to saw accordingly. If $\frac{3}{32}$ -inch is enough, then, obviously, $\frac{3}{16}$ -inch is 100 per cent too much; and, on the other hand, if the larger allowance is needed in order to take care of the shrinkage, the use of the smaller means taking a dangerous chance which may result ultimately in heavy loss through rejections or for some other cause.

The character of the lumber being manufactured of course has a great deal to do with it. Quartered oak shrinks more on the heart side, of course, than on the other, if it is inclined to be porous, and this would require a greater allowance than would otherwise be needed. Such a condition may affect the quartering of such woods as red oak grown in the lowlands of the South. Manufacturers of oak farther north have no trouble owing to undue shrinkage on the heart side of quartered stock, but this consideration may be one applying to the proposition of quartering southern red oak, and may explain to some extent why not a great deal of red oak in that territory is being quartered.

Conversely with the shrinking of quartered oak in thickness, plain oak shrinks chiefly in width; and consequently the allowance for plain oak need not be so great as for quartered. In practice, however, most manufacturers in the central hardwood belt allow $\frac{1}{8}$ -inch for both plain and quartered oak, finding that this applies to plain equally with quartered, as far as taking care of the shrinkage is concerned; but it is reasonable to believe in a case of this kind that the quartered oak might occasionally be a trifle scant and that the plain oak boards would come closer to measuring a full inch every time.

Apparently, though, there is no good reason in favor of allowing as much as $\frac{1}{8}$ -inch for oak; even that made in the territory farther south; and judging from the recent decision of the manufacturer referred to above, who believes that he is going to save a good many dollars' worth of valuable lumber by sawing it at least $\frac{1}{32}$ -inch thinner than he has been doing, it might be worth while for others who are making a similarly liberal allowance to make a few experiments and determine the results. This particular mill is cutting practically all plain oak, too; so that while cutting quartered $1\frac{1}{2}$ -inch thick might be a debatable proposition, there hardly seems to be any good reason in favor of manufacturing plain oak as thick as that.

A mahogany mill which cuts up a lot of lumber has recently changed its practice in this connection. It seems that it has been in the habit of allowing $\frac{1}{8}$ -inch for shrinkage; but experiments have been made and have shown that the actual shrinkage is not over $\frac{1}{32}$ -inch, and consequently the allowance hereafter will be exactly half that heretofore in vogue. In the case of a high-priced wood like mahogany, which is so valuable that it is sold by the foot, the necessity of extreme care is even more certain than where oak is concerned, although with timber prices rising steadily on the domestic wood there are plenty of good arguments in favor of a similar amount of discretion at the saw when cutting up oak logs.

It is said that another well-known mahogany concern has recently been experimenting to determine the amount of shrinkage to which the boards are subjected as to width, with the idea of developing a plan whereby the number of odd widths may be reduced to a minimum. The plan has not yet been worked out to a final conclusion, and to a man up a tree the exact method to be followed does not appear to be plain. However, the fact that efforts are being bent to this end simply goes to show that progressive lumber manufacturers are overlooking no opportunity to cut their stock along scientific, accurate lines, so as to avoid whatever waste can be eliminated.

The thing to remember in studying the shrinkage problem is that it does nobody any good to send out lumber that is thicker than necessary. On the other hand, it is a positive disadvantage in a large number of cases. For example, a concern which is working up oak, and wants it to finish $\frac{7}{8}$ -inch, would buy 1-inch lumber, knowing that the additional $\frac{1}{8}$ -inch would take care of the loss in working; but if the lumber actually delivered were $1\frac{1}{8}$ -inch in thickness, it would require just that much more effort and expense, as well as wear and tear on the planer, to dress it down to the required thickness, and to that extent would be undesirable.

The error can probably be more safely made on the side of scantiness, in view of the fact that the standard cabinet thickness is $\frac{3}{8}$ -inch, and hence a furniture manufacturer would probably not object to getting $\frac{1}{2}$ -inch lumber for inch. The export trade will

often receive $\frac{7}{8}$ -inch or even $\frac{1}{2}$ -inch lumber for inch, though its requirements as to accurate manufacture are strict, so that there are plenty of opportunities to work off stock which has dried a little thinner than the rules and regulations provide, but of course if one is selling inch lumber it is better to have inch lumber to deliver, as by this policy there is no opportunity for misunderstandings to happen.

Showing the variety of practice on this subject, a recent conversation participated in by three well-known lumbermen developed the fact that one allowed $\frac{3}{32}$ -inch for his inch quartered oak and $\frac{1}{8}$ -inch for his plain; the second cut all of his oak, both quartered and plain, $\frac{3}{8}$ -inch full, and the third allowed $\frac{1}{8}$ -inch for oak, poplar and chestnut that he expected to leave on sticks for six months.

Which had the right idea?

G. D. C., Jr.

A Remedy for Chestnut Blight

The Pennsylvania Blight Commission, which was appointed to combat the disease which is killing the chestnut in large areas of the East, announces that it has found a cure and a preventative. Up to the present, however, the remedy seems to have been tried only on isolated trees, valuable for shade and ornament, and not on forest-grown chestnut such as exists where this species is lumbered. The remedy found for park and yard trees will doubtless do the work as well in the forest, provided it is applied in the same way; but the item of cost is a very important matter and it may stand in the way of securing practical results. Nevertheless, any step in the direction of control of the blight will be welcome. If it is effective on a small scale it may be found practicable to apply it under less favorable conditions.

The spray used is the ordinary Bordeaux mixture, which is lime and copper-sulphate. The blight is due to a fungus which ramifies under the bark and girdles the tree. The spores of the fungus are carried by wind, on the wings and feet of birds, by insects, and doubtless in other ways. It is apparent, therefore, that the fungus will continue to spread as long as the spores are accessible to the agents which carry it, and as long as living chestnut trees are within reach. The proposed remedy aims to destroy the supply, to cure the trees already affected and by that means stop the spread to new grounds. The cure is accomplished by spraying contaminated trees, and by practicing tree surgery to the extent of removing diseased parts which act as centers for the spread of spores.

The Pennsylvania legislature appropriated \$275,000 to meet the expenses of the commission, and about \$250,000 of it has been expended in reaching the announced results. The experiments were made in Chester county, Pennsylvania, on trees from sixty-five to one hundred feet high, and it was found necessary to spray from the tops of other trees. The work began in the fall of 1911. Badly diseased branches were removed, and infections on trunks and limbs were removed whenever they were discovered. Mallets and gouges were used to cut away the diseased bark and wood, and the wounds were washed with bichloride of mercury to kill any spores or threads of fungus that might remain on the surface. The wounds were then covered with a weather-proofing consisting of pine tar, lampblack, and creosote, and occasionally rosin was added. Spraying began in April, 1912, and continued until November, the same trees being sprayed ten or fifteen times. It was elaimed in December, 1912, that fully seventy per cent of the surgical operations had proved successful to the extent that no spores had spread from them; and the tops of the trees showed little or no signs of disease.

To that extent the remedy appears to have been successful. It is believed by the men in charge that several sprayings in the course of a season will be found necessary to render a tree immune from attack if diseased timber is in the vicinity. It is, of course, not practicable to do this under ordinary forest conditions, but if one step has been successfully taken, it should not be considered impossible to find means of going farther.

Some Woods of the Pea Family

One is not likely to think of such common plants as beans, peas and clovers being closely related to some of the hardest and heaviest woods in this country, but such is the case. The pea family is very large and widely distributed in all temperate and tropical regions. It contains such well-known trees and shrubs as locusts, acacias or "mimosa-trees," as well as some of the most important food and forage plants in the world. One important feature they have in common is a fruit pod with bean-like seeds. Of the 430 genera now recognized, seventeen have tree representatives in the United States.

The trees of this family supply heavy, hard, strong, durable woods. The average specific gravity of the dry woods of twenty species in this country is .78, which is equivalent to a weight of nearly 45½ pounds per cubic foot. This is heavier than good quality white oak. One wood, the palo verde, even when absolutely dry, will sink in water and four others will almost do so. If one wishes a timber that will resist decay for a long time he may choose at random any of this family, for the heartwood contains substances which repel the attacks of fungi and insects.

The woods of the pea family seldom preserve their identity in the market because the quantities are too small and uncertain. About the only exception is the black locust, of which over 5,600,000 feet, board measure, were reported sawed in 1910. The others, viz., honey locust, Kentucky coffee tree, mesquite, Jamaica dogwood, red bud, cat's claw, Texas ebony, horse-bean, palo verde, ironwood, indigo bush, yellow wood, saphora, frijolito, mimosa, and wild tamarind, all play a part, however slight, in supplying local demands for certain kinds of material.

Black or yellow locust (*Robinia pseudacacia*) is widely distributed throughout the eastern half of the United States. It was for a time planted extensively, but the damage from boring insects has restricted its use. In favorable situations it attains a maximum height of one hundred feet and a diameter of four feet, but usually it is only medium sized.

The sapwood is thin and light yellow in color; the heart varies from golden yellow to brown, often greenish, usually uniform in a single specimen. The wood is extremely hard, like horn, and very strong. It splits easily, works well and takes a beautiful polish; it is liable to check badly in seasoning.

Yellow specimens of black locust wood look enough like the wood

of Osage orange (*Toxylon pomiferum*) to belong to the same genus, though in reality they are not even of the same family. In color, density, strength, size and arrangement of wood elements and the presence of tyloses in the vessels, there is often little difference. The rays of Osage orange are a little finer, the luster is somewhat higher, and there are narrow red stripes running through the wood. The color of the golden-yellow wood of locust is readily soluble in water and the wet wood gives off a stain when applied to white paper or cloth, thereby differing from Osage orange. The wood of locust also has a taste reminding one of uncooked beans, which is characteristic.

Black locust wood is seldom cut into boards and planks, at least not to remain in that form. Its principal use is for insulator pins on telegraph and telephone lines. Maryland reports an annual consumption of 900,000 feet and North Carolina, 2,600,000 feet of locust in this industry. In 1909 nearly eighteen and a half million insulator pins were purchased and of this number over thirteen million were of black locust. It requires a very strong wood and one that will resist decay, properties in which the black locust excels. California reports the use of 45,000 feet, board measure, for tree nails, and Kentucky 6,000 feet for hubs. Its great durability makes it well suited for fence posts, poles and railway ties. In 1909, 58,000 feet log scale of locust was made in Missouri into one-quarter-inch rotary cut venter. It is also employed to more or less extent for furniture, cabinet work, interior finish, turnery, handles, fancy articles, hub stock for carriages, policemen's clubs and fuel. Were it not for the danger from borers, its rapid growth, even on poor, sandy soils, would make it exceptionally valuable for commercial plantations.

Kentucky coffee tree (*Gymnocladus dioicus*) derived its common name from the fact that the seeds were formerly dried and used as a local substitute for coffee. It occurs sparingly on rich bottom lands in the central hardwood region, attaining a maximum height of one hundred and twenty feet and a diameter of four feet. It has leaves from one to three feet long and eighteen to twenty-four inches wide, divided and sub-divided several times, so that when they fall it appears as if the branches were dropping.

The thin sapwood is greenish; the heart is light cherry red to reddish brown. The wood is hard and strong, durable, very coarse-textured, usually straight-grained, splits readily, works well, takes a

high polish and is a handsome though coarse wood. It is used locally for posts, ties, bridge timbers, sills, interior finish, cabinet work and fuel. There are a great many purposes to which it is suited, but the scarcity of the timber limits its importance. The tree is quite common in some parts of Tennessee, where it is cut and sold as butternut.

The honey locust or thorn tree (*Gleditsia triacanthos*) attains its largest size in the valleys of small streams in southern Indiana and Illinois. It has been known to reach a height of one hundred and forty feet and a diameter of six feet, but more commonly is about seventy-five feet high with a broad, open, rather flat-topped head of slender, somewhat drooping branches. The sapwood is a pale yellow; heart, bright reddish brown. The wood is rather coarse-textured, hard, strong but somewhat brittle, fairly durable, works moderately well and takes a beautiful high polish. It is often confused with the Kentucky coffee tree, but the differences in texture, the size of the rays and the arrangement of pores in the outer part of the growth rings are sufficient to permit ready separation of the two.

The principal use is for fuel, fence posts and poles. It is employed occasionally for hub stock for wheels and in heavy construction. Some of it is made into furniture and when quarter-sawed the rays show to advantage. It makes attractive stair balusters and posts, and picture molding.

The mesquites form a group of small or medium-sized trees and shrubs in the arid Southwest. The most important is *Prosopis juliflora* and its two varieties. It thrives best along the richer valleys and follows the beds of small streams for long distances up into the mountains. It will send its roots to great depths in search of water and not infrequently the root development seems out of all proportion to the part above ground, giving the name "underground forests." The tree is small, often shrubby, but in good situations reaches a height of forty feet and a diameter of twenty inches.

A remarkable fact concerning the root wood is that it is heavier than wood from the trunk. The wood of the stem varies in color from a dark or reddish brown heart to a clear yellow in the thin sapwood. It is hard, heavy, dense, extremely durable in contact with the soil, but not very strong or elastic. It takes a beautiful polish and then somewhat resembles black walnut. The wood of both stem and roots contains over five and a half per cent of tannin. The black gum which exudes from cuts in the tree trunks and is apparently composed of dried sap contains over twenty per cent of tannin.

Mesquite is the most important tree in the Southwest. In many parts of New Mexico and Arizona it forms the chief, often the only fuel. The big roots are often dug up for this purpose. The tree does not reach proper dimensions for lumber, but makes good fence posts, railway ties, house blocks and paving material. It makes a high-grade furniture material, but is difficult to work because of its hardness. Large, heavy tables, deeply carved, are sold in some of the cities, but the work is done by hand, not in the regular furniture factories. Rollers for moving houses in the Southwest are preferably of mesquite because of its lasting qualities. Some is employed in making wagon fellos for use in hot, dry regions, but the wood is too brittle to withstand heavy shocks. It is adapted for turnery in the manufacture of gavels, goblets, trays and many kinds of novelties. An excellent, compact charcoal is obtained from it.

A report on the wood-using industries of Texas contains this paragraph in reference to the by-products of mesquite: "The pods are food for farm stock. Before the first railroad reached San Antonio mesquite pods were a regular market commodity. The Mexicans know how to make bread and brew beer from the fruit; tan leather with the resin; dye leather, cloth and crockery with the tree's sap; make ropes and baskets of the bark. Parched pods are a substitute for coffee; bees store honey from the bloom which remains two months on the trees; riled water is purified with a decoction of mesquite chips; vinegar is made from the fermented juice of the legumes; tomas of mesquite bean meal, pepper, chicken and cornshucks; mucilage from the gum; and gum drops from the dried sap."

It is interesting to note that mesquite was introduced into the Hawaiian Islands in 1837 and has now spread so as to cover between 50,000 and 60,000 acres in the leeward districts of the larger islands. The tree is known there only as algaroba. The algaroba forest is

the largest single source of fuel supply in the territory. It is estimated that over 3,000 cords are sold annually in Honolulu at a price varying from \$12 to \$14, delivered. The algaroba forests are further of value because the pods make good stock food and also because the tree is one of the important plants locally for bee pasturage. It was estimated that for the year 1907 the total amount invested in apiaries and other equipment for the manufacture of algaroba honey was \$125,000 and that the gross receipts for algaroba honey products for the year were over \$25,000.

Jamaica dogwood (*Icthyomethia piscipula*) is one of the commonest of the tropical trees of Florida. It attains a height of from forty to fifty feet and a diameter of from two to three feet. The wood is very heavy, hard, close-grained, very durable. The clear yellow-brown color makes it a handsome cabinet wood. Its principal uses at present are fuel, charcoal and boat building.

Cat's claw or devil's claw (*Acacia greggii*) is a much-branched, short-trunked tree, sometimes from ten to twenty feet high and six to twelve inches in diameter, growing in western Texas, southern New Mexico and southern California. It receives its name from the keen, hooked spines on its twigs. The wood is very hard and heavy, variable in color, sometimes grayish green, or dark red clouded with streaks and patches of other shades and tints. The wood is inclined to be contorted due to the presence of pits and cavities which slowly close as the tree grows older. It makes a handsome cabinet wood and is employed in small pieces of furniture, novelties and ornaments. It is also made into grills, tool handles and small turned ware. A resinous gum, resembling gum-arabic, is yielded by this species and the wood is so saturated that it feels greasy to the touch.

Texas ebony (*Zygia flexicaulis*) is one of three species, and grows in parts of Texas. The wood of the root is nearly black and is used to imitate the ebony of commerce. Stem wood, which is exceedingly heavy, is of a dark color, rich brown slightly tinged with purple. It is used in turnery for fancy articles, but principally for fence posts, fuel and crossties. It is also employed in cabinet making.

Horse-bean (*Parkinsonia aculeata*) is another small shrubby tree of Texas, Arizona and California. The wood is dense, hard and moderately heavy, and is occasionally employed in making small articles such as paper knives, rulers, paper weights and various novelties.

Palo verde (*Cercidium torreyanum*) is a much-branched, leafless, short-trunked, thorny tree from fifteen to twenty-five feet high and ten to fifteen inches in diameter, growing in the deserts of southern California. The wood is very hard and heavy, like horn. It has a few uses other than for fuel and the pungent fumes reduce its suitability for this purpose.

Ironwood (*Olneya tesota*) is a short, thick-trunked, bushy tree growing singly or in open patches in the hot desert regions of southern California and southwest Arizona. Perfectly dry wood of this species is heavier than water. The color is a deep chocolate brown, mottled with red; sapwood thin, lemon-colored. The wood is exceedingly hard to split or work and is used only locally for fuel and minor purposes.

Wild tamarind (*Hyasiloma latisilqua*) is a tree from forty to fifty feet high and two to three feet in diameter, in southern Florida. The color of the heart is like mahogany; sapwood thin, nearly white. The wood is used and valued locally in boat and shipbuilding.

Yellow wood (*Cladastris lutea*) is a rare and local tree of medium to large size and usually divided near the ground into two or three stems. It is found in Tennessee and occasionally in neighboring regions. The color of the heart is a bright, clear yellow, changing to light brown on exposure; of the sapwood nearly white. The wood is heavy, very hard, strong, close grained and with a smooth, satiny surface. Its use is limited only because of its scarcity. It has been employed occasionally for gun stocks, more often for fuel. It yields a clear yellow dye.

Mimosa (*Leucarna pulverulenta*) is a medium-sized tree with rather straight trunk eighteen or twenty inches in diameter, growing in Texas near the mouth of the Rio Grande. The wood is very hard and heavy. The heartwood is a rich, dark brown, resembling mesquite, thin sapwood, yellow. It is used in grill work, small pieces of furniture, tool handles, jewel boxes, and various novelties.

Tanners' Demands on the Forest

The art of the tanner is one of the most ancient and honorable in the catalogue. Probably converting hides into leather was one of the earliest of stated occupations; and the wonderful chemical changes which go on in the conversion have been the subject of study and experiment by the industrial chemist for many years.

The use of the bark of the chestnut oak in the manufacture of liquors used for tanning has been of long duration, and "oak leather" is a standard product and a staple commodity. Hemlock, on account of its proximity to many of the western tanneries, as well as the great available supply, is also being used, but is not generally considered nearly so good as oak.

It is worth noting, however, that the advancing cost of chestnut oak bark, as well as the increasing difficulty of getting it out, has gradually cut down the consumption by the tanners, while the use of extracts imported into this country by large concerns which operate in several remote quarters of the globe is constantly on the increase. Though the tanner prefers to use the good old reliable oak bark, which he can keep an eye on and leech according to his own ideas, still the force of necessity is compelling him to rely more and more on the importer and his extracts. The latter are not more costly than the liquors taken from the bark of the domestic oak, but for reasons of quality the leather manufacturer does not care to use any more of them than he has to.

To indicate the extent of the consumption, a visitor at one of the principal Ohio valley tanneries was surprised to notice several large tank cars standing on the siding. These had just been emptied of their contents of extract, which had been pumped into large tanks erected for the purpose. The tanner explained that they had to buy carloads frequently, contracting for their requirements for a year at a time and specifying deliveries as needed. Many of the tanners use scores of tanks of this material annually, and the business consequently amounts to a great deal.

In this connection, as a pointer to the stave men and others interested in the package business, it should be stated that the tank car has just about put the good old-fashioned barrel out of business, as far as the handling of extracts is concerned. The tanners used to buy their supplies of liquors in barrels, and those who have no sidings still do; but owing to the difficulty of keeping the barrels in good condition for return purposes, after they were emptied, and the comparatively low price paid on their return, most of the leather people have about come to the conclusion that it is more economical to use tanks.

Besides, they point to the labor that is saved by using the pump in transferring their liquors from the tank to the mixing vats, whereas with the barrel in use this was a more or less cumbersome and inconvenient process. From what could be gathered in a few conversations on the subject, the barrel men have about lost out with the tannery trade.

However, this may be offset by the fact that the importers of tannery extracts doubtless are compelled to ship their product in barrels from the point of manufacture to this country, and so are confronted with the necessity of using barrels for the first lap of the journey, even though the final shipment may be in tanks. Hence, the stave men and the shook manufacturer may get the business after all, even though the tanner doesn't buy his extracts in barrels at present.

The increase in the use of extracts, as noted, has been very much in evidence, but it is likely that while the cost of the bark may have had something to do with it, the difficulty of getting it at certain periods, when work in the woods is out of the question, is one of the biggest reasons in favor of buying more or less satisfactory substitutes. It is for this reason that the tanners are compelled to carry large stocks of bark in their sheds so as to enable them to tide over any periods when the country bark producers will not be able to supply them.

The chestnut bark production is chiefly in connection with tie

manufacture, little of it being handled at the sawmills, for the obvious reason that comparatively little chestnut oak is cut into boards. Its poor appearance and generally low-grade condition operate against its use for lumber, but it makes an excellent tie material, although unusually heavy and inclined to check. The tie men themselves do not as a rule look after the chestnut oak bark; but ordinarily arrange with the dealers in the commodity to strip the logs of the bark, which enables the tie manufacturers to handle the timber more conveniently. Consequently they charge comparatively little for this "bark privilege," as it might be called, and thus the dealers have an opportunity to get a pretty good profit out of it.

This is indicated by the fact that tanners at the Ohio river are paying \$12 a cord for bark, delivered; and as the rate on this material averages about 12 cents, making a freight charge of \$2.69 a cord, the \$12 charge produces a net price of \$9.31, which is pretty good, considering the price at which low-grade lumber is being sold. However, stave men and lumber manufacturers have never been interested in developing this end of the business, for the reason that chestnut oak itself is not highly regarded in either branch of the business.

The movement of the bark is usually not handled on a very up-to-date basis. As the material is produced in comparatively small quantities, it is hauled to the nearest railroad station and allowed to accumulate until sufficient tonnage has been secured to make up a carload. This is then shipped, but meanwhile the bark has been more or less exposed and has lost considerable of its "flavor."

A more scientific method has been adopted by a concern in eastern Tennessee, which set up a plant for the extraction of the tannic acid from chestnut oak bark, as well as from chestnut wood and other timber containing a fair amount of the desired chemical. In this way the manufacturer is able to ship the product at small cost, compared with the freight on the bark itself, and apparently should be able to develop a profitable business without much trouble.

The tanners themselves are old-fashioned and conservative, however, and most of them prefer to buy the bark, pile it until needed, grind it, convey it to their leech-houses, prepare the liquors, withdraw the spent bark, pump the liquors to the tanks to await use and go to all the other trouble and expense necessary, rather than get the oak extract in its final form and devoid of the inconvenience attached to the method usually employed.

But as one tanner put it, "Just as a coffee drinker would rather have his brew made from the freshly ground beans, so we want to get the fresh liquors from the bark. When the extract is made, the very last bit of the tannic acid is boiled out of it, and the results are not unlike those experienced by the coffee drinker who finds that the new cook has allowed the coffee to boil and boil and boil until it tastes like day before yesterday's dish water. The extractors, of course, endeavor to clarify the product as much as possible, and give us the best liquors they can produce; but at the same time we feel that quality leather can be produced more certainly when the tanner has full charge of the preparation of the bark."

It is interesting to learn that the tanners, instead of burning the spent bark, as formerly, are now getting value out of it by selling it to manufacturers of white lead. The latter employ it, it is said, in finishing their product, burning the bark with it as a means of carbonizing or corroding it. This prevents it from deteriorating through oxidation, as it would do if it were put out in a pure chemical condition.

A novel feature in toothpicks is now being advertised by a Boston concern. High-grade paper birch toothpicks are soaked in a decoction of cinnamon bark until they acquire an agreeable flavor and scent. A box of three hundred sells for fifteen cents.

Northern Poplar for Paper Pulp

The demands for raw material to supply the wood pulp industry have recently increased in leaps and bounds. In 1900 there were some odd 2,000,000 cords used; in 1911 there were over 4,328,000 cords used; thus increasing over 100 per cent in a decade. Spruce used to be practically the only wood used for paper pulp. Now it supplies only about fifty-eight per cent of the total amount, and a large portion of our spruce is imported from Canada. Besides spruce a large amount of hemlock, balsam fir and a great variety of hardwoods are coming into common use to supply the increasing demands not only for the newspaper trade but also for nearly every other form in which paper is used.

Among the most common hardwoods being used are beech, maple, birch, cottonwood and poplar. During the calendar year 1911, 368,000 cords of poplar were used as against 300,000 cords in 1908. It now furnishes about nine per cent of the total supply. Poplar is the usual term applied to two common species found in the North woods, the quaking aspen and the big tooth aspen or poplar. They are botanically closely associated. The former is the *populus tremuloides* and the latter the *populus grandidentata*. They are the common trees that spring up after the land is cut over and then burned over throughout the northern New England section, the Adirondacks, the lumber region of the lake states and throughout southern Canada.

Until a few years ago, little attention was paid to this growth, it being regarded as practically worthless and even injurious to a growth of the more valuable trees that might be restocking these cut-over areas. But with the rapid disappearance of our spruce timber and in looking about for some successful substitute it was found that the fibers of these poplars adapted themselves admirably for use both with the mechanical and chemical process of pulp manufacture. The largest part of it, however, is reduced by the soda process. The qualities that make these poplars valuable in this industry are the comparatively light, even and soft fibered woods. The tissues are straight grained and free from resins, tannins, gums and other undesirable elements. The bark is also very thin and is easily roused off by the barking machines. The wood of the large tooth aspen is somewhat heavier and harder (specific gravity .46) than that of the quaking aspen (specific gravity .40). They have found but little demand for use in other industries on account of the weak character of the wood as well as their poor durable qualities. However, both, and especially the large tooth aspen, have been considerably used in the excelsior industry and to some extent for box boards, woodenware and toys.

For paper pulp the average price paid at the mills for the poplars is about \$8.00 per full cord (a stack 4'x4'x8' long), and the price is steadily advancing as the supply of spruce diminishes. Spruce brings an average of about \$10.00 a cord now and some mills are forced to pay as high as \$16.00 per cord delivered. There are thousands of acres of burned over land in the Adirondacks, northern

Maine, New Hampshire, Michigan, Wisconsin, and Minnesota that are yielding good stands containing from ten to forty cords of poplar pulpwood per acre. A number of companies have been quietly buying up several large tracts of these old lumbered areas at attractive prices with the intention of cutting the poplar for cordwood.

Both species grow with remarkable ease and rapidity and several areas in the Adirondacks have been cut over at least two or three times for pulpwood. The big tooth aspen grows to larger size than the other and frequently attains a diameter of from ten to fifteen inches in from fifteen to twenty years. Both trees are comparatively short lived and decay sets in rapidly after attaining a certain age. The accompanying picture shows a splendid stand of poplar, both of large individual size of trees and of great extent over a considerable area. The trees stand fairly close together, trim themselves readily of the lower limbs and grow tall and straight.

These poplars should not be confused with the yellow poplar, the Carolina poplar or cottonwood which is a common tree in our eastern hardwood forests. This tree is also a very rapid grower and has been recently urged as a splendid tree to plant for pulp purposes

in various lumber and forestry circles. It has been widely planted for decorative purposes and has been successfully used in producing a paper of very high order.

On several hardwood operations, both the poplar and the cottonwood are being cut into cordwood lengths and shipped to pulp mills since they often command a better price when utilized in this form than in any other.

Those who reduce cordwood to board measure generally figure that a cord is equivalent to six hundred board feet, but that factor is not in

universal use. The accuracy depends largely upon the size and form of the sticks, the more open the ricks the less the actual quantity of wood present.

Over forty years ago an eastern railroad purchased one hundred lignum-vitæ ties at a cost of four dollars apiece. Of the original number forty are still in service and have outworn three sets of rails. The other sixty were removed because they were "spiked to death" and not from decay.

* * *

Libraries, locker-rooms and shower-baths are found in some big flooring plants, indicating that the owners of these establishments believe that aiding their men to keep clean, and to improve their minds with the right kind of reading, is not only humanitarian work, but a positive asset of the institution. It is easy to believe that the man who is employed in a flooring factory which takes account of his value as a man as well as a machine hand, is going to develop an intense degree of loyalty; and loyalty is a mighty asset in the battle for business, as well as in military operations.

A TYPICAL STAND OF NORTHERN POPLAR GROWING ON AN OLD BURNED TIMBER TRACT NEAR INTERNATIONAL FALLS IN NORTHERN MINNESOTA. THIS IS COMING INTO STRONG DEMAND FOR PULPWOOD

Wood the Underwriter's Scapegoat

George H. Holt of Chicago summarized the attitude of the fire underwriters very pithily some time ago when he said that reference to the use of wood in building construction was invariably met with the cry of "Fire!" There is no doubt that the consumption of lumber in buildings, especially those of great cost and pretensions, has been reduced because of the impression which has been created that wood is not only undesirable but positively hazardous.

In a recent issue *HARDWOOD RECORD* commented editorially on an article appearing in *Collier's Weekly* analyzing the causes resulting in an appalling annual fire loss. This article has been followed by a number of others dealing with the same problem. The series is called "The Business of Arson," and is the work of Arthur E. McFarlane. *Collier's Weekly* has a leaning toward the sensational, and is sometimes inclined to exaggerate; but it can be said for the benefit of those who have not read the stories that Mr. McFarlane has demonstrated that he possesses an intimate knowledge of the fire insurance business, and is writing facts. The fire insurance men may not agree with his conclusions, but they must of necessity acknowledge the truth of his statements.

In the very beginning of the series, we find these significant remarks:

"The authorities and the public alike have been going by a set of predigested theories, picturesque and plausible, no doubt, but put forward to hide the facts. We have been telling ourselves that our tremendous, ever-increasing fire loss is due to bad building construction; to carelessness, negligence and bad housekeeping; to our 'unparalleled industrial activity'; to our 'climate.' Let us take the first and most common objection—bad construction. Our standards in that respect are in the main indefensible. Once the fire starts, it is bad construction that burns an entire city. We are not concerned with that point, however, but solely with the question how the fire starts. Now wood is, by common consent, the most inflammable of building materials. Norway, Sweden, and South Germany are all wood builders, yet our ratio of loss averages from eight to thirteen times greater than theirs. This, too, in spite of the fact that their fire departments, compared to ours, are material for vaudeville. Again, New York and Chicago and Boston, even small cities like Flagstaff, Ariz., now have their 'fire limits'—great central areas where frame construction is no longer permitted, and in which for twenty years joisted brick has steadily given way to steel, concrete and hollow tile. Has this made itself felt? It is in the modern fireproof mercantile buildings of America—buildings unequaled in Europe—that our big cities' heaviest fire losses now occur!"

Isn't that a splendid commentary on the situation? Wood has been ruled out of building construction as far as possible to make room for so-called fireproof materials, and instead of the loss ratio falling, it actually increases! The reason given by *Collier's* writer is that arson is responsible: organized, widespread, systematic burning of property for money, resulting in fifty per cent or more of the payments made by the insurance companies being on criminal fires. Europe can use wood and have a mere fraction of our fire losses; but Europe has no arson trust. Instead of driving the incendiaries out of business and putting a few score of them in the penitentiary, America has chosen thus far to confine her efforts to improving the physical condition of buildings, centering her heaviest attack on the use of wood.

The logic of the situation is all with the magazine writer, who has analyzed the situation in great detail, and has shown how a period of numerous commercial failures is always preceded or accompanied by many fires; how changes of fashions result in the destruction by fire of goods which have gone out of style and consequently become worthless, except to the insurance companies, which are always ready to pay exorbitant prices for junk of this kind; how the evil of overinsurance, fostered by the flat

commission system, has been developed by greedy brokers and agents until every possible inducement is held out to the business man in straits to burn his own property, and every opportunity is offered the crook to go into a fake business and clean up a tidy profit by an annual fire.

Fire insurance men, in private, are constantly speaking of the moral hazard, and constantly protesting against the payment of losses on fires which they are certain are crooked, but which cannot be shown to be so. And yet they meet the situation publicly by appealing for better construction, ordinances limiting the use of wood, improvements in the fire department and waterworks system. It is as though a patient suffering from appendicitis and needing the heroic remedy of the knife were to be approached with a face lotion. The application is to the wrong spot. It can't get results, because the essential factor has been disregarded.

There is no telling what effect the *Collier's* series will have on the insurance situation. Fire underwriters may insist that while arson is a large item in the fire bill paid by Americans, loosening the regulations concerning construction and letting down the bars to the lumbermen for the use of their products would not help the situation. With some show of reason they might say that present efforts should be extended, and not discontinued.

But the lack of logic in their position is that "faulty construction," which has been made a synonymous term with "wooden construction," has been alluded to as the chief cause of our excessive fire losses. Now that it has been practically demonstrated that this is not so, there is no longer any good reason for discriminating against the third most important industry in the country in the regulations pertaining to building. As a necessary precaution, required in order to protect the community, the rigorous laws affecting the consumption of forest products in building might have been justified; but inasmuch as it has been shown that this alleged necessity does not exist, and that the real cause of the immense fire waste of the United States is due not so much to poor construction as to arson, the justification for making lumber the scapegoat of the entire situation disappears.

Probably it will be difficult, if not impossible, to extend the use of lumber much further in the general construction of large buildings. Reinforced concrete and steel are of course needed in the structural work. But in the interior finish, including the windows, doors, panels, moldings, floors, etc., and in the furniture used in these buildings, wood should predominate, considering every factor from beauty and utility to durability and cost. Lumbermen ought to study the facts in this connection and prepare themselves to oppose any statements of the wild-eyed variety regarding the dire effects of putting wood into a building. A little educational work along this line, undertaken by everybody interested, would go a long way toward eliminating the somewhat unfavorable sentiment that is found in many quarters. Of course the *Collier's* series is helping in that direction, and it should be followed up by those directly interested.

The extreme position taken by fire insurance authorities in the United States, along with the manufacturers of substitute building materials, to the effect that not a stick of lumber as big as a match ought to be used in a city building, is in sharp contrast with the sane and efficient regulations of European countries. They realize that for many purposes wood is better, as well as cheaper, than other materials; that its production and manufacture constitute an important industry, which should be encouraged as much as possible consistent with the general good; that fires can be prevented to best advantage by rooting out incendiaries, investigating all fires and publishing the criminally negligent as well as the incendiary himself; and consequently they are holding their losses down, by the use of common every-day horse sense, instead of radical and extreme measures at one end and none at all at the other.

It isn't often that a magazine gives the public illumination on the why's and wherefore's of the orthodox tenets of a big business affecting the public in a thousand ways, like fire insurance; and when a publication like Collier's really exposes the facts and demonstrates that lumber has been used as a target and

a blind to distract attention from more important factors, it earns the thanks of the entire community. Lumbermen at least ought to feel much indebted to Mr. Collier and Mr. McFarlane, and see to it that the public at large is given the essential points of the story of "The Business of Arson."

❁ Hardwood Used in Logging Conifers ❁

Although four-fifths of the standing timber in the United States is coniferous, nevertheless the hardwoods occupy a place which conifers cannot fill. The woods of the pines, the spruces and the firs, for example, are of simple structure, comparatively easy to work and to season, and well suited for construction purposes generally. They are, however, lacking in combined hardness, strength and toughness which make such species as the oak and hickory so valuable. The growth of hardwoods is usually slower and their soil requirements more exacting than those of the conifers, but there are many uses of timber for which only the hardwoods are suited and no solution of the future timber supply can be reached which does not take them into full consideration.

The logger in coniferous forests is daily acknowledging a debt to hardwoods in the many uses he makes of them. Take, for instance, the question of tools and equipment. An indispensable tool is the ax, and a most essential feature is that it should have a good handle. The choice wood for this purpose is second-growth hickory, though sugar maple, hornbeam and occasionally other woods are employed when hickory is not readily obtainable. The handles for single-bitted axes are either curved or straight, being largely a matter of individual preference. In the eastern part of the country loggers prefer a thirty-six-inch handle, while on the Pacific coast, where large timber is handled, the lengths vary from thirty-eight or forty inches for the average-sized timber to forty-four inches for redwoods. Handles for double-bitted axes are necessarily straight in order that either bit may be used, and are made in the same lengths as those for single-bitted axes. Handles for broadaxes are from twenty-six to thirty-six inches long and have a slight upward curve immediately behind the eye of the ax to enable the workman to assume a more upright position and still retain a correct cutting angle for the blade. The handle for a turpentine ax is straight and usually thirty-six inches in length.

The handles on cross-cut saws are made of sugar maple, beech or other good quality hardwood. They are always round, about 1½ inches in diameter and from twelve to eighteen inches long. Handsaw handles are mostly of beech, except for the highest priced, which are of apple wood.

An essential part of every feller's and log-maker's equipment is the wedge which is used to assist in directing the fall of trees and to prevent the saw pinching in the cut. They are made of hardwood or of metal. In the former case they are of hickory, sugar maple, beech, hornbeam, dogwood and persimmon, depending upon which kind is accessible. They have the advantages over metal wedges of being inexpensive and holding better. They are made by the sawyers as needed or by contract at about two cents each. They are ordinarily from six to eight inches long, 2½ to 3½ inches wide and about one inch thick at the head. From thirty to forty of these wedges are used up by a saw crew every month. A very large wedge, commonly known as a "glut," is often used in splitting posts and rails, being driven in after the cleft is started with an iron wedge.

Iron wedges are generally driven by means of a wooden maul made by the camp blacksmith from sugar maple, yellow birch, hornbeam or other hard and tough wood. A common form used in Maine is made from a round tree section, six inches in diameter and from twenty-six to thirty inches long. A head eight inches long is left on one end of the section and the remainder is trimmed down to a diameter of two inches to form a handle. Sometimes

the head is bound with iron hoops to prevent splitting. Mauls are also made from large oak burrs which are hewed out and fitted with a handle through the center. Such a maul can be made very heavy for splitting bolts, rails, posts and firewood and will last a long time.

The peavy is an indispensable part of the logger's equipment. The standard handle is 5, 5½ or 6 feet long, but may be made in special lengths as desired. The original handles of hickory or ash are often replaced by the camp blacksmith with maple, hornbeam, white oak or such suitable wood as is at hand. Handspikes are wooden levers from five to seven feet long. Only hardwoods such as hickory, oak, sugar maple, black birch, hornbeam and a few others have the required strength for this purpose.

Laborers engaged in bringing crossties, stave bolts and other timber down steep slopes often use a tool known as a "pick-a-roon." On a hickory, ash or oak handle is attached a head with a recurved pike for sticking into the bolt or tie to drag it. Frequently pick-a-roons are made from worn-out axes by removing a portion of the cutting edge. There are various other logging tools which require hardwood handles, a common example being the pike pole. The scale stick for determining the contents of logs is almost invariably of hickory, for few other species possess its suppleness and wear-resisting properties.

In the transportation of logs and lumber hardwoods play an important part not only in the regular wagons, trucks and sleds but also in various contrivances of local manufacture. A crude form of sled sometimes used in the pine forests of the South when the ground is too soft for wheels is called a "lizard." It is made from the natural fork of an oak or other hardwood of the requisite shape and strength, hewed flat on the upper and lower sides and with an upward sweep on the forward end so that it can readily slide over obstructions when in use. Across the two prongs is bolted a bunk for the log to rest on. The log is held in place by a chain which is finally passed through the upturned nose of the lizard. With this contrivance logs can be snaked out without difficulty unless the bottom is extremely soft and miry.

A higher type of sled used for the same purpose is known as a "go-devil." In this case two unshod hardwood runners, often yellow birch, are selected from timbers having natural crooks. The usual type is from 6 to 7½ feet long, 6 inches wide and from 3 to 5 inches thick. About 2 feet or so from the rear end of the runners is bolted a bunk, 6x6 inches square and from 4 to 5 feet long, bearing at the center a ring used in binding on the logs. The curved forward ends of the runners are connected by a roller. The sled is drawn by means of chains fastened to either side of the bunk or to the runners, and since it has no tongue a go-devil can be turned around within a narrow compass. Sometimes two go-devils are fastened together into a "jumbo" for hauling on snow for distances less than a half mile.

In the Northeast go-devils are replaced in some cases by yarding sleds or drays. A yarding sled is made by the camp blacksmith and consists of a pair of yellow birch or maple runners, 7 feet long, 3 inches wide, and shod with ½-inch steel. The runners are held together by a bunk 8 inches square and 4 or 5 feet long, placed about 3 feet from the rear ends. In order to facilitate handling the sled in the woods the bunk is made in two parts—a lower stationary bar firmly bolted and braced to the runners, and an upper piece which is temporarily removed when the sled is

turned around in the woods. The upper bunk has grooves in the ends or sides above the runner and these fit around pins, called "starts," which are fastened in the lower bunk. Five large logs or seven or eight small ones with one end supported on the bunk, the other dragging on the ground, can be hauled at a time.

There are various other kinds of sleds in use, depending upon the length of haul, kind of road, section of the country, etc. In the Lake States and Adirondacks, where yarding sleds are not used, a "bob" performs similar work. In some places logs are transported considerable distances on heavy sleds variously known as "two-sleds," "twin-sleds" and "wagon-sleds." They are made from well-seasoned oak, maple or birch. The woodwork lasts from three to four seasons, but the runner shoes must be removed every year. The cost of making a two-sled in a camp blacksmith shop, including labor and materials, is between \$50 and \$75. Dealers in logging supplies quote them at prices ranging from \$100 to \$150 each.

A low truck, called a "bummer" or self-loading skidder, has come into extensive use in the flat and rolling hardwood and yellow pine forests of the South, particularly in Arkansas and Louisiana. While those for sale by manufacturers have skeleton wheels 24 inches in diameter, with a 6-inch tire, many operators prefer to make their own out of black gum. In the latter case the wheels are solid, with a 14-inch face and a diameter varying from 18 to 21 inches, and possess the advantage of a greater bearing surface on soft ground. Heavy steel axles support a wooden bunk 2½ to 3½ feet long and slightly concave on its upper surface. A tongue 5½ feet in length is attached to the bunk and serves not only as a tongue but also as a loading lever. Small logs are held

on the bunk with chains and large ones with tongs. A log is loaded by placing the bumper, tongue up, alongside and 3 or 4 feet from one end, attaching the tongs and then pulling the tongue down into a horizontal position. This places the log on the wheels and by squaring the truck around it drops on the bunk and is ready to start for the skidway. Bumpers can be built by the camp blacksmith for from \$12 to \$15 each, while the dealer's price is about \$40.

In railroad logging stringer roads are sometimes built if suitable hardwoods are available for the rails. Crossties from 8 to 12 inches in diameter and 7 feet long are cut along the track and spaced from 18 to 24 inches on main lines and from 24 to 30 inches on spurs. On these are placed 6x6-inch wooden rails made up of two sawed pieces, 3x6 inches, one placed on top of the other and fastened together and to the ties by heavy wire spikes. The top rail is made of beech, birch or sugar maple and is sometimes covered with strap iron. For the lower rail any strong wood of little value, such as wormy oak, will do. The cost of maintenance of a stringer road is heavy as the rails sliver badly and break, requiring so much repairing after the first six months that the road is practically rebuilt in a couple of years. The cost of building stringer roads is from \$800 to \$1,200 a mile, exclusive of material, though this may be greatly increased where numerous bridges are necessary.

These instances not only show a number of convenient uses of hardwoods in logging operations, but also indicate the great saving in the cost of equipment which may be effected through the ingenuity and skill of a good camp blacksmith, and a little forethought in planning equipment.

Facts About Some Precious Woods

COCOBOLO

The best known grade of cocobolo grows in Central America and is shipped from Panama. This is a slow-growing, very hard, bright red wood, one of the brightest woods of commerce. The sapwood is yellow and quite heavy, an average sized log having about two inches. After being cut in the forests, the logs are chopped into short lengths, usually not over three or four feet, presumably to facilitate handling, as the wood will sink in water, making it impossible to float the logs down the rivers to the seaport. Many of the pieces become split and wormy, and a lot of this wood on being received is made up of billets of all shapes, weighing from thirty to four hundred pounds each.

EBONY

Ebony is well known as a precious wood. It is one of the hardest woods in existence and very heavy, sinking quickly in water; but unlike cocobolo, which has large pores and is of a tough, fibrous nature, ebony has very dense, close pores, and is of a brittle hardness, and consequently takes a high polish.

The best grade, known as Madagascar ebony, is jet black, and comes from the west coast of Madagascar. The end of a freshly cut log makes a striking appearance, as the sapwood is white and sharply defined against the jet black heartwood. This sapwood is nearly all adzed off before the wood is shipped, giving the logs somewhat the appearance of charred pieces. As the wood is received, the logs are from four to ten inches in diameter, by from four to eight feet long, and weigh from fifty to one hundred and forty pounds each. As the hearts of the logs are generally defective, much waste results in manufacturing.

The other most important classes of ebony are Tamatave and Gaboon ebony. Tamatave ebony grows on the east coast of Madagascar and is purplish-black in color. In size it is somewhat larger than Madagascar ebony, the logs averaging from 200 to 250 pounds each.

The source of Gaboon ebony is the northwest coast, or tropical part of Africa. This wood is grayish-black, with occasional light-

colored streaks running through it. The logs are prepared for market by being cut into sections, thus excluding the heart, which is of no use. All sap is removed, and the wood is received in the shape of billets of from thirty to one hundred pounds in weight. All ebony is very slow-growing, a tree giving an average sized log being one hundred years or over in age.

LIGNUM-VITAE

Lignum-vitæ is generally considered to be the hardest wood in existence. The main sources of supply are Hayti, Mexico and Cuba. The color varies from dark brown to a dark greenish-brown. The wood from Hayti is the poorest quality, and nearly all of the supply is used for casters for furniture. An average sized log is eight inches in diameter by three feet long, this including from one to two inches of sapwood. Mexican lignum-vitæ is next in quality, being generally sonnder and larger, but logs have a heavy sap, which is light yellow in color, and cannot generally be used, as it is softer than the heartwood. The lignum-vitæ grown in Cuba is very much superior to either of the other named grades, both in quality and size. Logs run from six inches to thirty inches in diameter by from four to ten feet long, an average log being twelve inches in diameter. This wood is greenish in color, and has a very thin sap. The logs measuring from eight inches to twelve inches in diameter inside the sap are called "ball-wood," and are manufactured into bowling balls. The larger wood is used in different kinds of shipbuilding. A piece of wood broken from a log shows a wavy, interwoven grain, and is very oily. The wood sinks in water almost as quickly as a stone.

Hardwood is the greatest product known for interior trim and decoration, and the way to get more of it used is to keep driving this fact home to the public.

* * *

There is perhaps many a man who has wished many times this spring that he had loaded up heavily on lumber last year.

F. R. GADD, NEW PRESIDENT CHICAGO LUMBERMEN'S CLUB. E. A. LANG, RETIRING PRESIDENT CHICAGO LUMBERMEN'S CLUB. E. E. SKEELE, TRUSTEE AND PROMINENT IN THE AFFAIRS OF THE CLUB.

Annual of Lumbermen's Club

Monday, March 17, was a gala day for the Lumbermen's Club of Chicago, being the date of its second annual meeting, annual election and a general celebration over the success that the enterprise has attained. The club rooms on the top floor of the Great Northern Hotel building were crowded with members all the afternoon and early evening, during which time the election of officers for the ensuing year took place. The following is the roster of the successful candidates:

PRESIDENT, F. R. Gadd.
 VICE-PRESIDENT, John Claney.
 TREASURER, S. C. Bennett.
 SECRETARY, T. A. McElreath.
 TRUSTEES FOR THREE YEARS: E. A. Lang, E. E. Skeele, W. A. Eager.
 TRUSTEE FOR TWO YEARS: Herman H. Hettler.

During the early evening a dinner was given in the club's dining room in honor of Retiring President E. A. Lang, at which upwards of fifty members of the club were present.

At the conclusion of the dinner Mr. Lang was presented with a handsome gold watch and chain, suitably inscribed "With the compliments of his friends and admirers in the club."

The arrangement of the dinner reflects credit on the "engineers" of the function, Messrs. Welch, Quixley and others.

The speech of presentation of the watch to Mr. Lang was a "jewel" in its way and was delivered by George J. Pope. The address is quoted in full:

Some years ago there was founded in Chicago by a number of bright lights and some good Indians the Fields Club. The club took as its creed the following poem, which, with your indulgence, I will read:

I've noticed when a fellow dies, no matter what's he's been—
 A saintly chap or one whose life was darkly steeped in sin—
 His friends forget the bitter words they spoke but yesterday,
 And now they find a multitude of pretty things to say;
 I fancy when I go to rest someone will bring to light
 Some kindly word or goodly act long buried out of sight;
 But if it's all the same to you, just give to me instead
 The bouquets while I'm living and the knocking when I'm dead.

Don't save your kisses to imprint upon my marble brow,
 While countless maledictions are hurled upon me now;
 Say just one kindly word to me while I mourn here alone,
 And don't save all your eulogy to carve upon a stone.
 What do I care if when I'm dead the Blommingdale Gazette
 Gives me a writeup with a cut in mourning borders set?
 It will not flatter me a bit, no matter what is said:
 So kindly throw your bouquets now and knock me when I'm dead.

It may be fine, when one is dead, to have the folks talk so,
 To have the flowers come in loads from relatives, you know:

It may be nice to have these things for those you leave behind:
 But just as far as I'm concerned, I really do not mind.
 I'm quite alive and well today, and while I linger here
 Lend me a helping hand at times—give me a word of cheer.
 Just change the game a little bit—just kindly swap the decks:
 For I will be no judge of flowers when I cash in my checks.

It does not take a very great flight of imagination to apply this sentiment to almost anyone who has labored for the benefit of others. Too often in this busy life of ours we neglect to say the kind word we meant to have said; we forget to do the kindly act we intended to do, until the opportunity has passed.

We all know that the man that is worth while does not labor for the praise of others; the men that are men of the highest type are far from being satisfied with praise or flattery. The consciousness of a work well done is a wonderful thing. Nevertheless the knowledge of its appreciation is always acceptable.

After a good beefsteak dinner we like a little dessert—the dinner is satisfying, but the ice-cream or pumpkin pie is gratifying; and it is just about the same distinction which I would apply to the self-consciousness of a work well done and the honor which follows it.

This club of ours has been indeed fortunate in having as its first president one who has filled a trying position with tact and skill. I believe that no one could have done more for us than President Lang. He has been faithful and he has been patient; he has given freely of his time and has thoughtfully considered what was for the best interest of the club.

And so, our dear president, your friends have decided that it is fitting you should carry with you, as you leave your office tonight, some expression of esteem which is lasting, changing slightly the words of a beautiful service which I trust we all of us hear at times. "This take in remembrance of us," and every time you look at it may it bring to your mind the face of some good friend, and may every hour that it records mark a period of time in which someone has given you a kindly thought.

For the purpose of gently joking Mr. Lang on the assumption that he was incompetent to make suitable acknowledgment of the gift, the original speech of acceptance was delivered by E. A. Thornton. The speech was of a humorous character, but was closed with the following beautiful lines:

Its pinions and hearings are jeweled,
 Its mainspring is jeweled too;
 But the beautiful thought that begot it
 Is jeweled through and through.

At the conclusion of Mr. Thornton's speech, Mr. Lang thanked his friends in the club in a heartfelt way for this evidence of their appreciation, but he modestly stated that the work was simply participated in by himself, giving credit of performance to the board of managers and the different committees associated with him in the conduct of the club's affairs.

At 8:30 the regular annual meeting of the club was called to order by the retiring president. The feature of the evening was the annual report of Mr. Lang, which is briefed below:

Mr. Lang said that in all probability the Lumbermen's Club of Chicago is the largest social club of lumbermen in existence, but he suggested that the incoming officers should not rest secure in the knowledge of this fact, for many of the present members had given their support when the club was organized because of loyalty to a trade project. He thought that there was great danger of losing some of this support when it appears that a successful launching of the club had been accomplished; that many of these members were affiliated with other clubs and it could hardly be expected that all would remain members of this one. He therefore asked that an active campaign be carried on to the end that the limit of resident membership (400) be reached in the near future. He asked for close co-operation between the house committee and the hotel management, with a view of maintaining a high standard of service in the dining room. This, he thought, would accomplish much in securing new members and retaining the old. He said also that a careful selection of entertainments will assist materially and stimulate in keeping alive the interest necessary for the successful operation of the club, as the members will patronize the club in proportion to the amount of entertainment, pleasure and comfort they can secure from it. He said during the last year the entertainment committee had given seven affairs, which had been well attended. He paid the entertainment and house committees glowing tributes for the hard and conscientious manner in which they have worked for the good of the club. The library and publicity committees also came in for their share of encomiums.

In closing Mr. Lang recommended to the next administration the adoption of the following financial plans:

Immediately upon the appointment of the new committees there should be made up a budget of receipts and expenditures, based upon the best estimates obtainable from the committees, club superintendent and other sources. The finance committee should prepare a careful estimate of the probable receipts from dues and other sources during the two half years and apply against this the expense of conducting various departments and the upkeep of the property of the club; this to guard against assuming any expense or unusual charges not within the estimated receipts of the club.

We go into the next year with a bright future before us. No debts, no litigation, and nothing but good feeling and loyalty apparent. It is my sincere wish that the club may always enjoy prosperity and grow to be one of the strongest trade clubs in existence.

Secretary Klann presented a brief report showing that the board of directors had held twenty-two meetings since the club was organized, fifteen of which were held since the opening night, April 6, 1912. The secretary's office had received and turned over to the treasurer \$16,702.77, and had expended, under the direction of the treasurer and on vouchers duly executed, \$1,488.63. The standing of the membership February 28 was 270 resident and 205 non-resident members, a total of 475, as compared with 483 when the charter list was closed. Death had taken one member from the club's ranks—George Green of the George Green Lumber Company, Chicago, who died August 31, 1912.

Treasurer Robert H. Gillespie in his financial statement showed a balance on hand at the end of the fiscal year February 28 of \$1,814.14. He stated that the club's finances were in better shape than that, as the balance on hand March 15 was \$3,761.57.

E. A. Thornton, chairman of the membership committee, verified Secretary Klann's report and said that it is a well-known fact that the second year of any social club is the crucial year of its existence, but, as the report of the treasurer shows the club to be in excellent financial condition, it requires only the co-operation of the resident membership with the various officers and committees to make the club a really strong social organization. He added that as soon as it has been definitely determined that the lumbermen will have an office building of their own and a home for the club established in this building, the membership will be greatly augmented. With the reports of the library committee, the art committee and the publicity committee, the regular order of business came to an end.

Mr. Lang introduced the new president, F. R. Gadd, who thanked

the membership for the honor conferred upon him, and stated that he felt that he was called upon to fill a position involving great responsibilities. He asked the members to withhold criticism and to co-operate with the officers in making the second year of the club's existence as successful as the first had been.

E. A. Lang, manager of the lumber department of the Paepcke-Leicht Lumber Company, has certainly made a most efficient president of the Lumbermen's Club, and there is apparently just as much promise of good work that will be accomplished by his successor, F. R. Gadd, vice-president of the Wisconsin Lumber Company and manager of the lumber manufacturing department of the International Harvester Company.

The Lumbermen's Club certainly has been very fortunate in the selection of its retiring as well as its new presidents. It is to be congratulated on the marvelous success that has been attained by this year-old club, which brings together in such cordial social relations the larger element of the manufacturing and jobbing lumber trade of Chicago, as well as the out-of-town members of the organization.

Traffic Matters Around Memphis

Lumbermen of Memphis expect to secure a favorable decision from the Interstate Commerce Commission in connection with the proposed advance on hardwood rates from ten to twelve cents per hundred pounds from Memphis and Mississippi points to New Orleans. The hearing in this case was conducted here during the past week before A. H. Elder, special examiner of the commission. The railroads were represented by a number of prominent witnesses, including Joseph Hattendorf, general freight agent of the Illinois Central. The lumbermen were represented by the Southern Hardwood Traffic Bureau and the river and rail committee of the Lumbermen's Club of Memphis. The hearing extended over practically a week and was the longest in connection with any advance which has been proposed by any of the railroads operating in this territory.

The principal contentions of the railroad witnesses were that the increased rates were necessary as a source of revenue and that, as the railroads had contributed largely to the extension of the lumber industry, they were entitled to a share in the increased profits derived therefrom.

On the other hand the lumbermen insisted that there had been no general advance in lumber prices since 1907 and that any attempt on the part of the railroads to increase the rates on gum in order to bring these up to the same level as other hardwoods would result in practically destroying the already established market for this lumber. George D. Burgess, president of the bureau, proved a valuable witness, while the members of the river and rail committee kept close tab on the testimony and aided the bureau in preparing counter evidence. Other witnesses who appeared for the lumbermen were: S. M. Nickey of Nickey Brothers Hardwood Lumber Company, J. D. Allen Jr. of the I. M. Darnell Sons Company, T. E. LeGrone and John Dwyer of the Lamb-Fish Lumber Company, and Elliott Lang of R. J. Darnell, Inc.

The outcome in this case is awaited with unusual interest because the railroads are now holding up other advances pending the decision in this contest. The lumbermen were successful in opposing a similar advance several years ago and they believe that they will be able to obtain a favorable verdict from the commission in the present instance. In the previous case the commission held the advance of two cents per hundred pounds to be both unreasonable and unjustifiable. This was styled *J. W. Thompson et al. vs. the Illinois Central Railroad et al.*, and involved exactly the same issue.

Some of the fellows who used to laugh at red gum will likely be crying for it before many more years roll by.

* * *

The fame of our forests will be made by historians after they have passed into history. Why not let the ad man make some of that fame now and reap some of the benefits?

Advantage of Personal Contact

Who has the advantage—the salesman of a large lumber concern with branch offices and a general sales-office, or the salesman for a small wholesaler who is in direct touch with the principals of his concern? That question has been brought up time and again and the writer claims that the latter “has it on” the salesman of the former in many ways. In the first place the former has nothing but a set of rules to go by and a system to follow out. If he takes an order provisionally it has to go through the system before it finally gets back to him or his customer and delays are fatal in many cases. Illustrating this, a large hardwood buyer wanted a car of clear saps poplar and talked with the local salesman for one of our largest concerns. The salesman’s stock-list showed one or two cars and he took the order at a good price because the buyer wanted it promptly. After a wait of over a week the general sales-office returned the order, saying that one of the other offices had sold that stock about a week before the order was booked. Meantime that buyer had been offered several other cars by wholesalers and all at lower prices. To make a long story short, when the buyer had that order returned from the company, he called up one of the local wholesalers and bought a car that was in transit. Now while this might never happen again, it left a bad impression with the buyer and when the first-mentioned salesman called again he needed another car of poplar, but did not consider that sawmill concern because he didn’t know whether he would get his stock or not. Of course some of you will say that this is an exceptional case, but if you are interested enough to find out, just ask any of your customers whom they would rather do business with—a small, personal-contact wholesaler or a large concern with “much-system-to-go-through-with-before-they-know-where-they-are-at.” The lumber business isn’t any too well systematized at best and a delay in quoting, in accepting an order, in shipping or in holding up an order on account of investigation of credit, is dangerous and is not conducive to further business. The small local concern, on the other hand, is in direct relationship with its local customers and generally has all the information in its office so that it is either “yes” or “no.”

Again, the salesman for the local concern has a better chance of making more money for himself, as his efforts are directly seen by the principals of the concern, and consequently is able to advance faster than with a larger concern. Where the salesman for a large concern is held down to a set of strict rules, the other man has the advantage of taking the matter up with his principals—in many cases he can take orders where the other man cannot.

That brings us up to the question of credits. You must realize that a large concern is in charge of a sales-manager whose duty is to ever put sales on the increase. Then there is the manager of a credit department. These two men work together, but the results are generally far from satisfactory. The sales-manager wants to boost the sales; the credit manager wants to lose as little as possible for his concern. Each man’s job depends on his ability to do it well. The credit manager in nine cases out of ten goes entirely by the agency reports and turns down from five to ten per cent of all business offered. If an order is taken and held up by the credit department for information there are the delays which were mentioned above. And so, with hard and fast rules to go by, the large company is at a disadvantage and will lose many sales. And another thing—when the credit manager is not satisfied he simply says that the company will ship the car and attach sight-draft with bill-of-lading, to which the buyer will reply that he can buy all he wants on his own terms and orders cancellation.

It has been the writer’s experience that the rating of a prospective new customer counts for much less than a close knowledge of local conditions, and that is why most of the wholesalers operating in one locality alone get business that the larger concerns lose. Of course, heads of large concerns will immediately take

exception to that statement and say that they could put men of executive ability in charge of their local offices and carry out the same idea. Well, you couldn’t do it! Why? Because you couldn’t pay them enough money and they can make more in their positions as wholesalers. You know right well that when you get an exceptional man you cannot hold him, for he can make more money by himself.

Being in personal contact with the trade in a certain locality, the writer, either in personal contact with the consumers directly or through the local salesmen, finds that credit should be judged as follows: First, the capacity of the men running the concern, and how they conduct it, their methods, etc.—that is the most important; second, the character of these men and their records; third, the capital. That’s a system of the three “e’s” (capacity, character and capital) and if any of the three are lacking, let it be capital. For example, if a man had a fair credit rating and a large capitalization, but did not know his business or was crooked, would you advance stock to him? Again, if he had the capacity and capital, yet you knew that there were points about his character or past records that would be detrimental to his business, would you sell him? But the man who has the capacity, working along the right lines, pushing for business, is a hard worker and has the character, sell him, regardless of his capitalization. Study of a man’s methods by close personal contact (and, as you see, it can be done this way only by men who are qualified to judge) shows you at once whether you will trust him or not.

A case in the East typifies the above. A large maker of a special cabinet with a national reputation has no rating. He does not make any statements and therefore what reports you secure are not encouraging. The writer handed his report to one of his friends, the owner of a large southern mill, and asked whether or not he would sell him. Indeed, he wouldn’t sell them on any such report. Yet this same millman was very much surprised to learn that the writer had put a number of high-priced cars in there and was still shipping and that most of the bills had been discounted. Then he said, “Well, you’re right on the ground with him and can watch him closer than I.” That comes pretty near proving the writer’s claim, doesn’t it? To go further into detail about this consumer—he is as straight as a die, a hard worker, has a splendid organization, his plant represents top-notch efficiency, he knows his costs, he makes a splendid profit per cabinet and he can’t turn the work out fast enough. He has just doubled the capacity of his plant. The writer one day asked this consumer why he didn’t make out a statement, and he answered, “It’s none of anybody’s business but my own. If people want to sell me, they must judge for themselves (get that—it means personal contact again). You sell me because you know I’m a good risk. If you didn’t you wouldn’t sell me. Another thing, I don’t want to do business with people in far-off places because I can get better service from my local sources of buying. If I find I can’t get credit I’ll make a statement, but as long as I can, what’s the use?”

In the general run of business you will find many good concerns who won’t make a statement, but that pay cash for all they buy. If you went through their plants and saw the way they did business you’d trust them, yet you can’t judge these things from a distance—and that is why you have to pass up the business.

And all this brings us right back to the old question—the logical trade channel. When we say logical, we must give a reason, and that reason is, as it always has been, that it is the lowest-sales-cost-per-thousand feet. That this is being gradually recognized by the mills who formerly thought they had “put one over” on the wholesalers by trying to deal with the consumer direct, is being evinced more and more as time goes on—that is, that the lowest-cost is the principal reason. Then there is the credit end, the fact

that wholesalers are specialists of sales, would leave the manufacturer to devote all his time to manufacturing problems and—but you know the rest of it.

Ask any salesman who has been employed by a large manufacturer who had a sales organization and who then has been employed by a representative wholesaler operating in a

specific section, to tell you which he prefers; there's a good way to tell. The writer thinks you'll find that in the former case he was simply a cog-in-the-machine and that nothing was left to him to use his judgment on, but that in the latter case he had a chance to develop and become a valuable factor in his concern. It's reasonable, isn't it?

H. E. S.

Wood-Using Industries of Maine

The state of Maine, in co-operation with the United States Forest Service, has published a comprehensive report on the forest resources and the utilization of wood in that state. Frank E. Mace, forest commissioner, compiled the data bearing on the resources, the forest laws, and the damage by fire; and the statistics relating to utilization were compiled by Jesse C. Nellis of the Forest Service. It is, therefore, a double report, dealing first with forest resources, and then with the manner in which those resources are put to use.

The year 1911 was disastrous for its fires. The burned area covered 111,077 acres, entailing a loss estimated at \$337,355. Conditions were much better in 1912. During that year twenty-one forest fires were started by lightning, and one by a somewhat unusual cause, a balloon. The record for the year 1912 was 20,240 acres burned, damage \$71,248. The patrol system in Maine has proved highly satisfactory. Men are employed as needed, that is, when the weather is dry and danger is great, and they are taken off when weather conditions render their services unnecessary. A well-planned system of telephones has been established to assist in fire protection. Under the terms of the Weeks law, Maine received \$10,000 from the Federal Government to assist in controlling fires in 1912. Only one other state, Minnesota, received as much.

The sawmills of Maine cut \$60,273,000 feet of lumber in 1911, about one-tenth of which was mixed hardwoods, principally birch, oak and maple. In addition to this the output of pulpwood was equivalent to 458,379,500 feet, slack coopeage 24,855,333 feet, tight coopeage 2,332,000 feet, veneers 3,554,000 feet, and firewood the equivalent of about 737,000,000 feet; total forest output for the state, 2,086,393,833 board feet. That shows Maine to be an important producer of forest material, and it stands high in comparison with other states.

The wood-using industries of Maine convert 245,614,150 feet of rough lumber into finished products. This does not include pulp, coopeage, veneers, and fuel. It refers only to factory products such as boxes, furniture, vehicles, interior house finish, agricultural implements, and similar articles. The reports made by manufacturers show that fifty-two different kinds of woods are used as raw material from which the finished commodities are made. That number is evidently too small, for the reason that several kinds are grouped as one. For instance, all spruce is listed as red spruce, though both white and black spruce go to Maine factories, but in rather small quantities. The same observation holds for the oaks, maples, ashes, and others.

Of the fifty-two woods listed, nine are foreign. The most important of the foreign woods is mahogany, but the combined use of all the nine falls considerably below 200,000 feet a year. It is thus shown that Maine is not a large user of foreign woods. In fact, the manufacturers there depend largely upon the forests of their own state for what they need. Less than 34,000,000 feet were brought into the state and this was made up chiefly of white pine, red spruce, balsam fir, yellow birch, sugar maple, longleaf pine and loblolly pine. White pine, spruce and birch grow abundantly in Maine, and that which came across the border was imported only because it was convenient. The largest quantity of outside wood shipped in was longleaf pine from the South. Of the birches used, the largest amount was paper birch, which is the chief material for spools; yellow birch, useful

for flooring and furniture, was next in quantity, while sweet birch was used to the extent of only 5,000 feet.

Though the hardwoods in Maine constitute only about one-tenth of the total sawmill cut in the state, the hardwoods going to factories for conversion into finished commodities exceed one-third of all wood reported, indicating that, as material for manufacturing, hardwoods are in much more demand than softwoods. In this comparison, the hardwoods are broadleaf trees, and the softwoods are those with needleleaves. Three woods constituted sixty-five per cent of all. They were white pine, paper birch, and spruce. Willow at \$12 per 1,000 feet was the cheapest wood, while teak at \$400 was the most expensive.

The principal industries in Maine which use wood as raw material, and the annual quantity demanded by each are the following:

Industry	Feet.	Cost.
Boxes	25,741,000	\$617,530
Planing Mill Products.....	21,335,000	511,244
Shuttles, Spools, Bobbins.....	13,055,400	438,096
Sash, Doors, Etc.....	10,734,200	180,503
Boot and Shoe Findings.....	10,299,400	355,214
Ships and Boats.....	9,310,000	193,508
Handles	8,196,500	189,405
Woodenware	7,532,000	112,434
Dowels	5,704,500	105,915
Laundry Appliances	4,431,500	133,955
Car Construction	4,269,000	85,559
Toys	3,765,000	86,742
Furniture	3,050,000	86,775
Matches and Toothpicks.....	1,054,500	25,633
Vehicles	647,600	14,471
Caskets and Coffins.....	645,000	12,245
Brushes	533,000	11,337
Printing Material	380,000	23,046
Fixtures	320,000	5,120
Dairy Supplies	302,000	4,475
Butcher Blocks	285,000	5,375
Bungs and Faucets.....	269,500	5,260
Chairs	230,000	4,818
Athletic Goods	94,250	3,386
Patterns	54,400	1,780
Pulleys and Conveyors	41,000	880
Miscellaneous	4,456,000	70,625
Total	245,614,150	\$4,957,035

The average cost of the woods used in the above industries, when delivered at the factories, was \$20.18 per 1,000 feet.

An Old Roof

The lasting properties of wood have been discussed many times and by some persons it is looked upon as an old story; but a recent order to examine the timber roof of Westminster Hall calls attention to a famous wooden structure which has stood in the damp climate of England 514 years. The roof was placed on that building in 1399 in the reign of Richard II. It displayed the original Norman structure. The roof which is to be examined includes the timbers and supports only. The part which is exposed to the weather and sheds the rain is made of sheets of lead. The purpose in examining the roof is to make sure that decay has not weakened the timbers.

No man ever invented a system that was good enough to run a business by itself; but there are several, either of which will help a man considerably in the conduct of his business.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 409—In Market for Basswood

Kiel, Wis., Mar. 8.—Editor HARDWOOD RECORD: We are in the market for several carloads of 1½ inches and 1¼ inches No. 2 and No. 3 common dry basswood, and also some ash. Do you know where we can get it?

The above inquirer has been supplied with a brief list of possible sources of supply for this lumber, and any others interested in the inquiry can have the address on application.—EDITOR.

B 410—Has Birch for Pacific Coast Market

Springfield, Mass., Mar. 18.—Editor HARDWOOD RECORD: Kindly advise us as to a list of wagon manufacturers on the Pacific coast who use birch.

The foregoing letter is from a leading eastern manufacturer who has been supplied with a list of wagon manufacturers on the Pacific coast, and has been advised that a large portion of them employ a greater or lesser quantity of birch.—EDITOR.

B 411—Seeks Timber Census

Brooklyn, N. Y., Mar. 15.—Editor HARDWOOD RECORD: Some months ago, if I remember correctly, you published a very interesting and valuable article in regard to the standing timber in the United States, and a map showing its location. Can you send us a copy of this issue of your paper?

The writer of the above letter has been advised that we think the article to which he refers appeared in HARDWOOD RECORD, December 25, on pages thirty-four and thirty-five, copy of which was mailed him. This graphic map and text referred to lumber production and did not involve a census of the standing timber. The writer has been advised that the latter is absolutely an unknown proposition, even after all the work that has been done by the census department and the Forest Service. The quantity of standing timber remaining in the United States is simply a guess.—EDITOR.

B 412—Wants 5/8-Inch Beech

Reading, Pa., Mar. 17.—Editor HARDWOOD RECORD: Can you put us in communication or give us the names of some firms that handle beech lumber? We are in the market for 5/8 inch stock.

MANUFACTURING COMPANY.

The foregoing inquiry is from a specialty manufacturing house, and anyone interested in marketing 5/8 beech can have the address on application.—EDITOR.

B 413—Seeks Oak, Poplar and Spruce

Glasgow, Scotland, Mar. 1.—Editor HARDWOOD RECORD: As we are very anxious to increase our business for the sale of northern hardwoods, we take the liberty of writing you to ascertain if you could favor us with the names and addresses of some reliable shippers of northern white oak lumber, railway oak planks, poplar and West Virginia spruce. Also if you know of any reliable southern shippers of ash and hickory logs and hickory dimension stock.

The above letter is from a leading Scotch timber brokerage house, which has been supplied with a brief list of possible sources of supply for the woods mentioned. Any others interested can have the address on application.—EDITOR.

B 414—New Cabinet Woods

Louisville, Ky., Mar. 11.—Editor HARDWOOD RECORD: We have some sample logs of new cabinet woods, with whose properties we are desirous of becoming acquainted before we attempt marketing them. HARDWOOD RECORD has been carrying a series of articles on the cell structure, strength, etc. of various woods, and it has occurred to us that the author of these articles might be prevailed upon to analyze these woods for us. We want as complete a report as possible on the cell structure, texture, strength, dry weight, density, etc., and the probable availability of them for cabinet or other purposes.

The writer of the above letter has been advised that if he will supply this office with specimens of the wood in question they will be carefully analyzed for him, and a report made thereon.—EDITOR.

B 415—Forked Leaf Oak Trademark

Pine Bluff, Ark., Mar. 8.—Editor HARDWOOD RECORD: We are getting up stationery for our new hardwood company, and it is our intention to show the foliage of a forked leaf white oak with an acorn as a trademark for our oak flooring. Will you kindly supply us with a picture showing the form of the leaf of this tree, and very much oblige?

The writer of the above letter has been supplied with a leaf print of forked leaf white oak.—EDITOR.

B 416—Condemns Oak Price Boosting

Detroit, Mich., Mar. 12.—Editor HARDWOOD RECORD: In the interest of good common sense and conservative action, we want to ask you to use your influence to check the radicals who are at this time seeking to boost the price of oak lumber beyond a safe and normal condition. You know that we are interested on both ends of the game as our sawmill plant at Kentucky gets the benefit of high prices in rough lumber, but just from a common sense standpoint, remembering what happened to poplar five years ago, we think it is time to call a halt in boosting the prices of oak lumber, and your journal will have a very marked influence in this matter through your editorial columns. Please advise us what you think of this proposition.

Thanking you for attention, we are,

The foregoing letter is from the president of a foremost concern engaged in the manufacture of oak lumber and the production of oak flooring. The writer's attention has been called to the cartoon published in HARDWOOD RECORD, February 10, and the editorial comment on the oak situation made on that date, which is entirely in accord with the opinions expressed in this letter. Beyond question there is a serious menace in continued prosperity in the hardwood lumber business when values are placed at an unreasonably high level. Substitute materials other than lumber take the place of fancy priced wood, and once these substitutes are established in public appreciation, they are very hard to dislodge.—EDITOR.

B 417—Seeks White Ash Logs

Dayton, O., Mar. 13.—Editor HARDWOOD RECORD: We are continually in the market for prime second-growth white ash logs. Can you furnish us with the names of parties who can supply us the logs or small mills that manufacture this stock?

The foregoing letter is from a leading specialty manufacturer who has been supplied with a brief list of possible sources of supply for ash logs.—EDITOR.

B 418—Seeks White Ash

Columbus, O., Mar. 15.—Editor HARDWOOD RECORD: Can you give us the names of some parties in West Virginia who can saw ash in special dimensions for me?

The writer of this letter has been given a brief list of possible sources of supply of the stock desired.—EDITOR.

B 419—Who Wants Sassafras?

Owensboro, Ky., Mar. 15.—Editor HARDWOOD RECORD: We have several cars of sassafras logs we would like to find a market for. Would thank you to put us in touch with buyers of this wood.

The writer of the above letter has been advised that while there is a limited market for this excellent wood we are unable to give him a specific place for its disposal. Hence, anyone interested in the purchase of sassafras logs or lumber can have the address of the writer on application.—EDITOR.

B 420—Has Applewood to Sell

FRONT ROYAL, VA., March 17.—Editor HARDWOOD RECORD: Is there a market for applewood, and if so, are you in position to put us in touch with somebody interested in this wood? We could furnish a carload in the log.

The above manufacturer has been supplied with a brief list of users of the material he has to offer.—EDITOR.

In cutting a tree into logs the sawyers too often do not take pains to secure the highest quality of material. The rule should be to keep the best portion of the bole in separate logs from the knotty portions. It is not uncommon to find several feet of clear length put into a log with several linear feet of knotty material. Such action is costly since the value of the log is largely determined by its poorest section. It may often prove more profitable to waste a few feet of rough log if by so doing the amount of high-grade lumber can be increased.

News Miscellany

Meeting of Memphis Lumbermen's Club

The Lumbermen's Club of Memphis, at the meeting held at the Hotel Gayoso, Mar. 15, unanimously adopted resolutions approving the bill to be introduced into the Tennessee legislature for the purpose of creating a forestry department in charge of a state board of forestry composed of nine members, headed by the governor of the state. This action was taken following an address by H. W. Lewis setting forth the objects to be accomplished by the bill. He said that the forests of Tennessee were being cut at such a rapid rate as to insure depletion of the timber supply within a comparatively short time unless steps were taken to reforest the waste lands. He declared that it was not the purpose of the bill to do anything that would be objectionable to the lumbermen of the state in any way, but that, on the other hand, it would be the purpose of the department to provide timber that would be suitable for the lumbermen in later years. He outlined the measure, briefly pointing out that the work was to be under the direction of the board, which was to employ a chief forester to be recommended by the head of the forestry department of the United States and one assistant forester for each of the three grand divisions of Tennessee. He also said that experiment stations were to be established in practically all the counties and that seedlings were to be furnished to lumbermen at actual cost. As an illustration of the working of the proposed measure Mr. Lewis said that there were 100,000 acres of land outside the levees in west Tennessee so subject to overflow as to be unavailable for agricultural purposes. He thought that this would afford an excellent opportunity for reforesting with cottonwood. He said the land would be vastly improved and that a merchantable supply of cottonwood would be available within thirty years. Mr. Lewis said that the Southern Commercial Congress was behind the bill and that, when it had been passed in Tennessee, efforts would be made to secure similar legislation in the other southern states not already having a forestry department. His address created very great interest and was followed by a number of questions prompted by what he had said.

S. B. Anderson of the law and insurance committee said that he had gone over the bill very carefully and had ascertained the fact that there was nothing therein objectionable to the lumbermen. He approved the fundamental principles of the measure and declared that the forests of Tennessee were being cut at such a rapid rate that some steps toward reforesting ought to be taken. He believed in adopting the plan of Germany, which is to put all lands in forests, which are unavailable for agricultural purposes. He particularly approved the suggestion of Mr. Lewis for reforesting the lands outside the levees in west Tennessee, as well as the islands in the Mississippi river. He suggested that the club adopt approving resolutions which had already been prepared. This was done by unanimous vote.

J. W. Spaulding of the Paine Lumber Company addressed the club in behalf of red gum. He brought a round of applause when he expressed the hope that red oak might be \$15 per thousand higher in order that red gum might become the standard for interior finish. He thought this lumber was superior to red oak in more than one respect and pointed out the fact that there were no hidden defects and that the figuring was much more perfect. He told the lumbermen that he has done everything in his power to secure the change in specifications from birch to red gum in connection with the new Chisca hotel which is being erected here. The Paine Lumber Company has the contract for the mill work in connection with this building.

It was quite apparent from a report made by C. W. Holmes of the J. J. Holmes Lumber Company that the insurance companies had already begun revising rates for Memphis as a result of the activity of the law and insurance committee. Mr. Holmes said that he had been advised that revised schedules had been issued reducing the rates in the case of a number of yards in New South Memphis and that he understood that still further reductions were to be published at an early date. M. V. Rush of Moffet, Bowman & Rush advised the club that the rates on the yards of his firm had been reduced from \$2.26 to \$1.45, with a further reduction to be made as soon as there had been compliance with regulations regarding the fire alarm boxes to be used. This revised schedule is being published under the auspices of the Tennessee Inspection Bureau. Lumbermen are very much gratified with the reduction in rates by the law and insurance committee, which has had this matter in charge and will continue its activity to the end that further reductions may be effected.

J. W. McClure of the river and rail committee reported that he and other members of his committee had spent practically all the past week attending the hearing before the Interstate Commerce Commission at the Hotel Gayoso, involving the proposed advance of two cents per hundred pounds on hardwood lumber from Memphis to New Orleans. He said the results of this hearing would be very far reaching, as further advances were being held up by the railroads pending the outcome in this case. He felt sure that the ruling would be particularly important as affecting cottonwood and gum, which the railroads were seeking to raise to the

same rates as other hardwoods. He pointed out that the case was handled admirably by the Southern Hardwood Traffic Bureau and that much splendid work had been done by the lumbermen who testified that the committee was hopeful of the outcome.

A letter was read from the Lumbermen's Club of St. Louis, extending to members of the local club an invitation to make their headquarters at the offices of the former whenever they were in St. Louis. It was pointed out that codes, telegraph blanks and other facilities for the transaction of business would always be found ready to hand. The club acknowledged this communication with thanks and extended an invitation to the members of the Lumbermen's Club of St. Louis to make their headquarters in the offices of the Lumbermen's Club of Memphis when in this city.

This meeting was exceptionally well attended and proved one of the most interesting as well as the most enjoyable held this year.

The following new members were elected: Active—C. T. Whitman of the Whitman Lumber Company, Earl, Ark.; J. S. Williford, Bellgrade Lumber Company, Memphis; Chris H. Meyer, Nickey Brothers Hardwood Company, Memphis; Associate—George F. Rammelsberg, Clarendon Car Factory, Clarendon, Ark.; H. H. Alexander, Alexander Brothers, Belzoni, Miss.; Thomas H. Paine, Ward Lumber Company, Sunflower, Miss.

Monthly Meeting Philadelphia Lumbermen's Exchange

The Lumbermen's Exchange held its regular monthly meeting, preceded by a luncheon, Mar. 13. President William F. Betts in the chair. It was announced at this meeting, that the annual banquet would be held this year on Apr. 10, on the roof garden of the Bellevue-Stratford hotel.

J. Randall Williams, Jr., chairman of the committee on forestry, gave notice that the Pennsylvania Forestry Association would hold an exhibition in Horticultural hall, from May 19 to 24, to which the exchange is urged to send an exhibit. The State Forestry Association and the various state colleges are sending elaborate exhibits. The president appointed J. Randall Williams, chairman, B. Franklin Betts, Amos Y. Leshner, Isaac Troth and John E. Lloyd, a committee to take the matter up.

An interesting address by Amos Y. Leshner, on "Why Retailers Should Become Members of the Lumbermen's Exchange," was much appreciated at this meeting. A resolution was passed that a copy be sent to all who are not members of the Exchange. The reading of papers on topics of particular interest to lumbermen at these Exchange meetings is an institution of President William T. Betts, who incidentally admits that it was through a suggestion of Secretary John H. Lank, that his attention was first called to the matter. They will be the means it is believed of enlarging the attendance, and so increasing the membership of the Exchange.

Railroad Constructors Meet

The fourteenth annual convention of the American Railway Engineering Association was held at the Congress hotel, Chicago, Mar. 18-21. The sessions brought out a vast quantity of useful discussion and numerous papers of high practical and technical value. There were submitted bulletins on railways and organization; iron and steel structures; track; rail; economics of railway location; wooden bridges and trestles; wood preservation; ties; signs; fences and crossings; conservation of national resources; buildings; grading of lumber and numerous other topics of equal importance. On the fourth day of the meeting, those in attendance visited the National Railway Appliances Exhibition at the Coliseum. The annual dinner was held on the evening of Wednesday, Mar. 19.

National Inspection for February

The statement of the inspection bureau of the National Hardwood Lumber Association for February, 1913, shows the total of 9,903,727 feet which is an increase of 709,394 feet over February, 1912. The salaried inspectors' work for the month covered 1,771,433 feet more than February, 1912, while the fee inspections are about 1,000,000 feet under the February, 1912, record. This volume of inspection cost the association \$593.93 in excess of amount earned, which is due in a large measure to the unfavorable weather conditions that prevailed in many sections.

Since the last report of Feb. 15, fifteen new applications for membership have been received, bringing the total for the present fiscal year to 110.

The sixteenth annual convention will be held June 5 and 6 at Chicago, Ill., with headquarters at Hotel Sherman. There is sure to be a very large attendance and the secretary expects to announce the program of business and entertainment at an early date.

Biltmore Doings for February

Students of the Biltmore Forest School left their winter quarters at Darmstadt, Germany, for their annual trip to the Black Forest of Germany on Feb. 6. Of all the wooded districts of Germany none presents such beautiful and varied landscape as the Black Forest nor is any so famous both sylviculturally and historically. En route the students stopped at Karlsruhe. Here they were privileged to visit, under the guidance of the forest superintendent, the city forests and also a forest of several hundred acres owned by a stock company, which pays about four per cent on the par value of the stock. These stockholders are using the forest for a hog pasture, owing to which a natural second growth of pine presents itself.

The most interesting and instructive trip during the journey through the Black Forest was the visit to the Schiffferschaft. This forest consists of 1,200 acres and has been under the control of the same corporation for seven hundred years. It possesses a most unique history. The original owners were lumbermen who cut the timber and sent their drives down the Murg and Rhine rivers to the Holland trade. Prior to 1718 the existence of many small principalities through which the logs had to pass before reaching the market brought about conditions under which it paid to cut only the very best of the trees. Within recent times the increase of transportation facilities and the consequent broadening of the market, together with the possibility of marketing any and all of their wood products, has made the enterprise very profitable. Many of the stockholders are also mill owners and, buying their own timber, make a double profit. They demanded, however, the best and most accessible logs, with the result that the lower strips were soon stripped of the best growing timber. The results of their destructive methods are still to be seen in the varying treatment which has had to be applied to each portion separately in order to restore it to a paying basis. With the advance of lumber prices, the old methods were dropped and it became imperative to treat the forest to constructive rather than destructive methods. The old splash dams are a thing of the past and everywhere the forests are traversed by the finest of macadam roads. On steep slopes, the logs are lowered at the ends of ropes. By taking a turn of the rope around a standing tree, the progress of the logs can be easily controlled.

In the Black Forest the forest rotation is one hundred and twenty years. This means that it takes that time to develop a stand of timber to the point of maturity, when it is cut and the process started over again. Inasmuch as different sections are maturing each year, there is a constant source of supply and constant work being done to regenerate where the mature stands are cut. There is still a considerable amount of big timber in the Black Forest.

The students also visited an extensive furniture manufacturing plant near Darmstadt where they had an opportunity of comparing German with American methods. The general methods are not unlike those employed in American furniture factories, but the finished product is far more artistic in design than the average high-grade American product. It is often more solidly and perfectly made in all of its parts. Genuine old pieces of furniture are used as models. French cottonwood is used for the veneer cores. Walnut root wood veneer was shown costing \$2.00 per sheet of 16x18 inches.

In the last excursion of February the students found themselves, instead of in the woods or at sawmills, traveling the narrow and crude streets of "Old Frankfort." No city of Germany has a greater wealth of history behind it than has Frankfort, which first came into prominence in the time of Charlemagne. From then on it grew steadily in importance and in 822, at the time of Louis the Pious, it was looked upon as the capital of the Frankish empire. From the time of Frederick Barbarossa, the German sovereigns were chosen at Frankfort. All the emperors from Albrecht to Francis II were crowned in this quaint old city. From the tenth down to the nineteenth century, when it became part of Prussia, Frankfort was a free city. At the present time it contains 370,000 inhabitants and is one of the most important commercial centers of Germany. Its money market is almost as influential as that of Berlin and the whole appearance of the newer city indicates general prosperity. It was the old part of the city, however, which commanded the interest of the students. They were shown all types of German architecture from the Roman to the German renaissance and it can be said that Frankfort contains some of the best examples to be found in Germany.

As announced formerly, the students sailed on Mar. 15 on the S. S. New Amsterdam of the Holland-American Line. Headquarters upon return to America will be Tupper Lake, N. Y., in the heart of the Adirondacks.

A Splendid Example of End-drying

Accompanying this story are two photographs illustrating well the splendid results obtained by careful end-drying in northern stock. These

sheds are part of the extensive equipment of the Stearns Salt and Lumber Company of Ludington, Mich. W. T. Culver, vice-president and active manager of this company's extensive operations, has made an exhaustive study of the possibilities of end-drying and has come to the unqualified decision that this method produces the very highest and most uniform results in all species of high-grade northern stock. As a consequence, while this company devotes its end-drying sheds principally to the drying of white maple, it is putting various kinds of high-grade lumber up in this way and it is its intention to expand considerably in this line. The experiments, which covered a period of two years, established the fact that while the cost is somewhat greater, the results are so far more satisfactory as to leave no more room for doubt as to which method should be pursued. The greatest benefit is derived from drying stock in this way, which is in any way designed for special requirements. The superior condition of the stock will more than offset the cost.

It can be seen from the exterior view of the shed that narrow strips are used on the outside of each course. These strips are of dry hemlock and prevent side discoloration, along the edges of the outside pieces. The Stearns company uses only one narrow crosser, which is thoroughly dry and therefore prevents the possibility of sticker marks. The floors of the sheds are built up even with the tramways which allows a perfect air circulation. Thus far, the experiments have covered bird's-eye maple, white maple, straight-grained maple, red birch, sap birch, straight-grained beech, white basswood and various other special orders of unselected stock. The company's sheds now have a capacity of from 3,500,000 to 4,000,000 feet a year and it is hoped that this capacity will eventually be doubled.

Suffered Small Loss by Fire

The New England Hardwood Company, of Mountain Mills, Vt., suffered a small loss by fire on the morning of March 9. Its office building, containing its office, store and the postoffice, was completely destroyed. The new mill, which stands only about one hundred feet from the burned buildings, was saved by a fortunate wind which shifted the fire in the opposite direction. The fire was discovered a little before five o'clock in the morning, and owing to want of fire protection the loss, so far as the buildings and contents were concerned, was pretty nearly a complete one. However, the loss to the company is not serious, as it was fairly well covered by insurance.

Expansion of Willey Interests

An important expansion of the manufacturing interests of C. L. Willey, the leading mahogany lumber and veneer producer of the country, at his Chicago plant is in its initial stages. Mr. Willey has just closed for the purchase of a frontage of 1,443 feet lying between Slip E and Robey street, immediately south of his present big plant and land holdings, for a consideration said to be about \$200,000. The vendor of the property was Mrs. Charles P. Taft of Cincinnati.

This purchase gives Mr. Willey about twelve and a half acres of land with railroad trackage on two sides extending from a point a short distance south of Blue Island avenue, on the south branch of the Chicago river, clear to the Drainage canal.

From a historical viewpoint this purchase has a special interest as it is on this site that the landing of Marquette in 1673 took place, which is recorded by a big mahogany cross erected by Mr. Willey a few years ago, which was dedicated by the Illinois Historical Society.

At the present time Mr. Willey is engaged in remodeling his sawmill and veneer plant, and extending it with a view of increasing his output materially. He has just purchased from the Allis-Chalmers Company a Pacific coast type band sawmill, which will supplement his present band mill, and will shortly install another and smaller one for the conversion of core stock into crating material, making the whole equipment a three band sawmill. He has also just placed in commission a Kraetzer Preparator for the steaming under pressure of mahogany and other high-class cabinet woods to prepare them for prompt and accurate seasoning.

Right now Mr. Willey has what is probably the largest and finest holdings of mahogany and Circassian logs that were ever seen at one time in the history of the trade; and besides he has other large log purchases

MODERN END-DRYING SHED, STEARNS SALT & LUMBER COMPANY, LUDINGTON, MICH.

END DRYING HIGH-GRADE STOCK, SHOWING PROTECTION STRIPS ON EDGES OF BOARDS.

contracted for both in the tropics and at Liverpool, which insure him a full stock of fancy veneer flitches and fancy wood lumber material for nearly a year to come.

The high price of oak and other better types of American woods has resulted in a tremendous increase in demand for mahogany and other imported woods. This has resulted in not only that Mr. Willey but all other fancy wood producers are extremely busy at the present time with a demand that exceeds the supply.

New Oak Flooring Factory

As is generally known to the trade, the larger proportion of the lumber product of the Yellow Poplar Lumber Company, Coal Grove, O., is now white oak from that region of the splendid growth of this wood in Dickinson County, Virginia, although a considerable quantity of yellow poplar is still being made. Fully eighty per cent of the output of this sterling hardwood house is now white oak, the larger portion of which is manufactured into quarter-sawn stock.

The company is now engaged in the building and equipping of an oak flooring plant at Coal Grove, in connection with which there has already been put in commission a new Grand Rapids dry kiln of the latest type, and within the next month the entire installation of electrically driven machines will be in place for the production of flooring.

Death of D. P. Mann

Lumber interests in Memphis were very much shocked Sunday, March 16, by the announcement of the death of Donald P. Mann, vice-president of the Chapman-Dewey Lumber Company, which occurred the night before. Mr. Mann had been quite ill for some time but his partner, Mr. Dewey, who had been with him for some time, left on a business trip Saturday

on the theory that he was very much improved. His death occurred a few hours later from heart trouble. He was known to be in a somewhat serious condition but the end was not expected so soon.

Mr. Mann came to Memphis from Kansas City. He had been engaged in the newspaper business at that point. He became associated with the Chapman-Dewey Lumber Company and for a long time looked after the interests of this firm at Marked Tree, Ark. The firm largely increased its holdings in that territory and later Mr. Mann not only became a partner in the firm but was elected vice-president. He was one of the best known lumbermen in this part

CHAS. K. PARRY, PHILADELPHIA. VICE-PRESIDENT CAROLINA SPRUCE COMPANY

of the country. He leaves a wife and two children. He also had three brothers and three sisters. Two of the former are Bishop Cameron Mann of North Dakota, and Rev. Alex Mann of Trinity Church, Boston.

Chas. K. Parry & Co. Make New Connection

Beginning April 1 Charles K. Parry & Co., Philadelphia, will offer to the trade, the product of the Carolina Spruce Company, Pensacola, Yancey County, N. C. The tract of timber was formerly known as the Johnson tract, and is conceded to be one of the finest in that section. Everything new and the best to be had has been installed; a Wheland band mill, a new American loader and a new Shay engine, which outfit will place this company in a position to furnish to the trade the best manufactured lumber possible today.

The officers of the Carolina Spruce Company are C. S. Aldrich, formerly of the Nelson Lumber Company, Johnson City, Tenn., president and general manager; Charles K. Parry of Charles K. Parry & Co., Philadelphia, vice-president; L. E. Faulk of Pensacola, N. C., secretary and C. A. Oberlin, formerly of the Nelson Lumber Company, treasurer.

Planing mill facilities will be added this summer, and the capacity of the mill will be not less than an average of 90,000 feet daily. The timber was estimated at 140,000,000 feet all in one compact body. Of this approximately 100,000,000 feet is spruce and the balance mostly hardwood with some hemlock. The first cut will be hemlock and spruce, although there is at present about two million feet of hardwood ready for shipment. All of this timber is exceptionally large, nothing ever having been cut from it. Many of the poplar, oak and chestnut logs are too large to handle with ordinary equipment. Railroad connection has just been established, as the timber lies eighteen miles from Boonford, on the C., C. & O., which railroad has financed the Black Mountain railroad, built from Boonford to Pensacola, in order to get the hauling of this

lumber. The railroad rates are all favorable to the eastern shipment of this lumber, and the entire output will be handled by Charles K. Parry & Co., at 1431 Land Title building, Philadelphia, Pa.

Charles K. Parry, vice-president of the Carolina Spruce Company, and owner of Charles K. Parry & Co., has had much valuable experience in the lumber business. In 1909 the present firm of Charles K. Parry & Co. was formed. Mr. Parry evidently inherits his knowledge of the lumber business as his father conducted a large retail yard near Hattboro, Pa., for twenty-five years, and his great grandfather, Isaac Conard, operated a sawmill where now stands that section of Philadelphia known as Kensington. Mr. Conard bought rafts, which were at that time floated down the Delaware river, also sawed locally for people owning timber in the immediate vicinity of Philadelphia. Mr. Parry is vice-president of and controls the output of the Selma Lumber Company, Selma, N. C. He also controls the Clio Lumber Company, Bingham, S. C., and is interested in and controls the output of B. B. Gray, at Pine Bloom, Ga.

Baird-Coale Lumber Company

The Baird-Coale Lumber Company is a new lumber organization that has just been incorporated under the laws of Delaware with a paid up capital of \$15,000, and home office at 814 Fisher building, Chicago, which will commence doing business on Apr. 1. The principals of the company are D. W. Baird, president and general manager, and George M. Coale, vice-president and treasurer.

D. W. Baird, who has been identified with the Chicago lumber trade for several years under the title of the D. W. Baird Lumber Company, was born at Greenwood, Clark county, Wis., August 27, 1877. He is unanimously known in the trade as "Dan." He started in the lumber

business in 1897 with the Fenwood Lumber Company at Fenwood, Wis., as inspector. In January, 1898, he went with the Morton-Edgar Lumber Company at Lancaster, Wis., as buyer and inspector of northern hardwoods. In January, 1899, he engaged with the Tucker-Hooper Lumber Company, Chicago, as buyer and inspector of southern hardwoods, and a year later joined the Dudley Lumber Company, Grand Rapids, Mich., as manager of its southern hardwood operations, and opened up a yard for that company at Logansport, Ind., and later in Memphis, Tenn. He remained with this company for six years and then went with Banks & Co., Hernando,

D. W. BAIRD, PRESIDENT BAIRD-COALE LUMBER COMPANY, CHICAGO.

Miss., as general manager of their sawmill operations and domestic and foreign sales, where he remained until January, 1910, when he established the D. W. Baird Lumber Company, which institution was removed to Chicago on Jan. 1, 1911. This company has done a largely increasing business from that time until now, when the concern is being merged into the new Baird-Coale Lumber Company.

George M. Coale, vice-president and treasurer of the new concern, was born at Gosport, Clarke county, Ala., May 30, 1885. He started in the yellow pine business as clerk for the Kirby Lumber Company, Beaumont, Tex., and from there went with the Keith Lumber Company at Voth, Tex., as chief clerk to the secretary and sales manager. This position he held for two years, gaining much practical mill experience. In 1905 he went with the Continental Lumber Company at Houston, Tex., as chief clerk, where he remained until the first part of 1907, when he succeeded Ben S. Woodhead as secretary and sales manager, where he remained until October, 1909, when he re-entered the employ of the Kirby Lumber Company as northern sales manager with headquarters at Chicago. On Feb. 1, 1911, he returned to the Continental Lumber Company as vice-president and sales manager, which position he has held up to the present time, when he resigned to join D. W. Baird in the Baird-Coale Lumber Company.

The many friends of both principals of the Baird-Coale Lumber Company will wish the new company the success it undoubtedly will achieve because both the principals are well-equipped to command an excellent business in Chicago and vicinity.

Smoker of St. Louis Lumbermen

The St. Louis Lumbermen's Club held a smoker in the cabin at Faust's Restaurant on Tuesday evening, Mar. 18. The fun began when the members sat down to a Dutch lunch and did not end until many enter-

taining features were pulled off. President Whitmarsh did not take up much time when he called for order. He only told of several innovations, in addition to those already mentioned, that would be inaugurated later on. Quite a number of new names were added to the roster of the club. In addition to the lunch, there was plenty to drink and the hundred members who attended the smoker enjoyed every moment. There was singing, music by a rag-time player, and a cabaret entertainment. Julius Seidel, chairman of the entertainment committee, was responsible for the entertaining features. The evening was one of the most enjoyable spent by the club for a long time.

New Plant of Saranac Machine Company

The accompanying illustration gives an excellent idea of the new manufacturing plant just completed by the Saranac Machine Company, Benton Harbor, Mich. This building is located midway between Benton Harbor and St. Joseph and is easily reached from either city by electric cars.

This firm started some fourteen years ago in a small way and its growth has been steady until finally the increasing volume of business and the large demand for its machinery compelled the company to erect the new factory which it now occupies. Here every facility for the construction and erection of the high-grade products of its factories is provided. The new location is situated on a tract of land that provides ample room for expansion as necessity demands it.

The main building of the new plant is 60 x 192 feet. The front section has two floors. Heavy mill construction with a foundation of reinforced

the laws of Michigan. The firm's policy is extremely progressive and it incorporates in its products the most advanced ideas. The company maintains a complete and competent engineering department for the designing of machinery, which department is always at the command of its customers.

New Hardwood Concern in Minneapolis

The Joyce-Bartell Company is the style of a new concern organized at Minneapolis, which brings together two men who have been prominently identified with the lumber business for years. The incorporation consists of John Joyce of Ashland, Wis., president; W. D. Bartell, Minneapolis, vice-president; and W. L. Joyce, Minneapolis, secretary and treasurer. Mr. Bartell and W. L. Joyce will be the active principals in the business and will both be located at Minneapolis. They are both men of experience and there is every chance of their establishing for the new firm a prominent place in the hardwood lumber trade.

John Joyce is a well-known lumberman of northern Wisconsin. He is a member of the Foster-Latimer Lumber Company of Mellen, Wis., and the Mellen Lumber Company of the same place. W. L. Joyce is the son of John Joyce and started his career in the lumber business with the Foster-Latimer Lumber Company at Mellen. Four years ago he went to Minneapolis. He first was affiliated with the Forest Lumber Company and later with the Joyce-Connor Lumber Company, which took over the business of the Forest Lumber Company at Minneapolis.

W. D. Bartell has for sixteen years been prominently associated with

PLANT OF SARANAC MACHINE COMPANY, BENTON HARBOR, MICH.

concrete was used. The factory floor is divided into three sections or bays. The east bay is utilized for the erection of the lighter types of machines, the north bay contains the machine tools, all of which are of modern design, and the west bay is used for erecting the heavier types of machines and is served with overhead traveling cranes. The arrangement of the factory is such that the company is able to obtain straight line production, thus doing away with any necessity of re-handling.

One of the important items of production of the Saranac Machine Company is the single and multiple head wire stitching machines used in the manufacture of bushel basket covers, fruit crates, berry boxes, wire bound boxes, etc. In addition, a large percentage of the automatic machinery used in the manufacture of wire and veneer and paper butter dishes has been manufactured by this firm. Its automatic machines for turning out berry boxes of veneer or paper have a capacity up to one hundred complete baskets per minute. The company's automatic paper package machines are a marvel of efficiency. These machines take the paper from the roll and feed, print in one or more colors, cut, crease, set up, wire stitch, wax line and deliver the package complete at a rapid rate. In fact, the firm has an international reputation as a designer and producer of high-grade machinery for the production of veneer and paper packages.

For the wooden packing box trade, three types of corrugated, joint fastener driving machines are made, enabling the company to meet practically every requirement for machines of this kind. In addition to the lines enumerated above, the extended experience of the Saranac Machine Company covers the manufacture of machines in many other lines, including machinery for packing cereals and other articles which can be packed in paper packages.

The Saranac Machine Company is a stock company, incorporated under

U'pham & Agler of Chicago, and during the last three years has been the Minneapolis representative of that concern.

The new company will handle both northern and southern hardwood lumber and will make a specialty of factory lumber.

The offices will be maintained at 814-15 Lumber Exchange building.

American Forestry Association to Visit Biltmore

Today, Mar. 25, the directors of the American Forestry Association will meet in their regular quarterly meeting at Asheville, N. C., adjacent to which is the famous forest estate of George W. Vanderbilt, widely known as the Biltmore estate. With the directors are a number of lumbermen, foresters, owners of timberland, and others interested in forest conservation. The party traveled in special cars on the Southern Railway, reaching Asheville this morning, and are quartered at the Hotel Langren. The afternoon of Mar. 25 is being devoted to a trip in carriages through that section of the Biltmore estate adjacent to Mr. Vanderbilt's famous mansion. C. J. Beadle, superintendent of the estate, is acting as escort to the party. This trip enables the visitors to make a study of the most advanced application of modern forestry to be found anywhere on the American continent. On the evening of Mar. 25 there will be a public meeting in the interest of forest conservation in the convention hall at the Hotel Langren. Dr. Henry S. Drinker, president of the association, and also president of Lehigh University, will talk on the question of forest taxation, of which he has made a special and exhaustive study. J. S. Holmes, secretary of the North Carolina State Forestry Association, will also address the guests at the banquet, as will J. E. Rhodes of Chicago, secretary of the National Lumber Manufacturers' Association.

On Mar. 26 the party will journey in automobiles as the guests of

Mr. Vanderbilt to Pisgah forest. This is the real forested section of Mr. Vanderbilt's estate. Here they will see what has been done in the primeval forests in the interests of forest conservation, close utilization and fire protection. Business sessions of the directors have been held en route on the trains.

First Log Cut at New Chicago Veneer Plant

On Monday, Mar. 24, the Fred W. Black Lumber Company opened up the first log cut at its splendid new veneer plant on Fortieth avenue near Twenty-second street. This plant has been in the course of construction for several months and is now pretty well shaped up in running order. Three veneer saws will be installed within a few days. The plant is equipped with a splendid line of appliances of the very highest design and quality. The plant is undoubtedly a model in design and provides for the maximum of light for working, and of comfort, cleanliness and efficiency.

The Fred W. Black Lumber Company has unloaded at its yard a splendid assortment of genuine African mahogany logs and, judging from the high character of the figure shown in the logs already opened up, a lot of the very best type of highly figured mahogany for piano and furniture manufacture is assured. In addition, a considerable quantity of selected white oak logs of Indiana growth has already been delivered and in fact the company now has sufficient logs on hand to run for a considerable time and has ample cargoes and carloads of both mahogany and oak en route.

Proposed Sale of Government Timber

Because of the proposed sale of the 260,000,000 feet of timber in the Priest River valley, Kaniksu National Forest, Idaho, the government has prepared a prospectus covering this timber. This prospectus shows how the Forest Service furnishes information to lumbermen who might be interested in bidding on national forest timber.

An unusual feature of this sale is the fact that on part of the area the forest will be destroyed. The object will be to clear this area for agriculture instead of forest regeneration. Provision 8 of the timber sale contract and the privileges regarding agricultural land under the head "Rules for Marking and Process of Disposal" illustrates how this will be done.

When the area has been cleared of timber and the slash burned, the land will be opened to homesteading. If the Forest Service did not sell off the timber before opening the land to entry, the value of the present stand of timber would cause the land to be held speculatively, instead of being cleared for farms. But this land will be better employed growing farm crops than growing timber and hence the Forest Service is preparing to put it into the hands of bona fide settlers under a procedure which will insure agricultural development. The Federal government will receive about \$650,000 for the timber, of which \$225,000 will go to the benefit of the state for public schools and good roads. The maximum stumpage price of \$5.00 specified for the white pine on these logging chances is unusually high because this western white pine is the most valuable stumpage on the national forests.

The twelve per cent profit to the lumberman allowed for in calculating the stumpage rates to be charged is exclusive of interest on the investment, which is figured at six per cent. The minimum prices allow therefore for a profit of twelve per cent on each thousand feet of timber cut, over and above interest on capital and all overhead expenses. This is a smaller margin of profit than the Forest Service minimum prices usually reckon on logs, but competition for this timber is exceptionally keen. It is recognized that in general the manufacture of lumber is a business which, because of the risks involved, requires a high return in order to induce operators to undertake a logging enterprise.

For the Boss

Your men will show interest in you in the same proportion that you show interest in them. Also, never forget that they may know something that you do not know. Therefore, give them a willing ear, and due credit for what they do know.

Some employers never seem to differentiate between conceit and enthusiasm in their men. Some men are so enthusiastic about their work that they love to talk about it; and some employers, blind to their own interests, mistake it for conceit. That is why a good employe is sometimes lost in the scuffle.

Hardwood News Notes

< MISCELLANEOUS >

The Manufacturers' Lumber Company recently began business at Pittsburgh, Pa.

The Southern Lumber & Room Company of Valley View, Ky., has gone out of business.

A. H. Richardson, Boston, Mass., has been succeeded by the A. H. Richardson Lumber Company.

The Michigan Handle Company has been incorporated at Brook Haven, Miss., with a capital of \$10,000.

The Little River Lumber Company has been incorporated at Caruthersville, Mo., with a capital of \$25,000.

The Athens Table & Manufacturing Company of Athens, Tenn., has reorganized, incorporated at \$50,000.

The Sumter Broom & Handle Company has been incorporated at Sumter, S. C., with a capital stock of \$2,500.

The Sidnaw Handle Company has been incorporated at Sidnaw, Mich., with an authorized capital of \$5,000.

The Thornhill Wagon Company of Lynchburg, Va., has increased its capital stock from \$300,000 to \$1,000,000.

The Otis Manufacturing Company of New Orleans, La., has increased its capital stock from \$200,000 to \$700,000.

The Standard Red Cedar Chest Company, Inc., Altavista, Va., has increased its capital from \$25,000 to \$100,000.

The Michigan Chair & Table Company recently began business at Lakeview, Mich. It will manufacture furniture.

The Western Grand Rapids Company has been incorporated at Albany, N. Y., with a capital of \$10,000, to manufacture furniture.

The El Dorado Manufacturing Company will erect a large plant for the manufacture of crates, boxes and baskets at El Dorado, Ark.

The Ypsilanti Furniture Company of Ionia, Mich., has recently suffered a loss of about \$265,000 by fire. The plant will be rebuilt.

The F. H. Smith Company of St. Louis, Mo., has been succeeded by the Smith-Sueme Lumber Company and will operate with a capital of \$25,000.

The lumber mill of Hare, Robinson & Hughes, Richmond, Va., was recently destroyed by fire of unknown origin. The loss was estimated at \$20,000, partly covered by insurance.

The Crawfordsville Furniture & Lumber Company of Crawfordsville, Ind., has been incorporated with a capital of \$75,000, to succeed the Montgomery Hardwood Lumber Company.

Messrs. James R. Andrews and J. A. McQuire of Marinette, Wis., have purchased a tract of 6,400 acres on Lake Superior, where they plan to erect a sawmill to be ready for operation next fall.

The Manchester Lumber Company is a new corporation at Manchester, Vt. The company, which is capitalized at \$50,000, will erect a sawmill, planing mill, novelty and hardwood flooring company.

Frederick S. Giddings, a pioneer hardwood lumberman, died recently at the home of his daughters, Mary and Helen Giddings of Cleveland, O. Mr. Giddings was eighty-one years of age and is survived by five children.

The Wolfe Lumber Company, McMinn county, Tennessee, has received its charter. The company is capitalized at \$10,000. The incorporators are M. E. Bryant, J. R. Wolfe, J. L. Ferguson, J. W. Brown and J. H. Dougherty.

The Midland Lumber Company of Minneapolis recently purchased from the North Star Lumber Company a line of lumber yards in eastern Minnesota and northwestern Wisconsin. The consideration is said to be about \$200,000.

The Monarch Lumber Company has been incorporated at St. Louis, Mo., with a capital stock of \$25,000, half paid. The incorporators are Frederick A. Goodrich, I. E. Crawford of Oklahoma City, J. A. Meyer, G. A. Hart and E. E. Hart.

The Scranton Road Lumber Company, Cleveland, O., which suffered loss by fire in November, is preparing to go out of business. The unburned lumber, together with the buildings and lease on the land, will be taken over by the C. H. Foote Lumber Company.

The wagon stock plant of the Clark-Gay Manufacturing Company of Little Rock, Ark., which burned last December, is now nearly reconstructed. The plant will probably be in operation the last of the month and is one of the largest and most costly hardwood plants in Arkansas.

The Hooton Hardwood Company, a branch of the R. A. Hooton Lumber Company of Terre Haute, Ind., will open offices in the Wright building, St. Louis, to manufacture and wholesale oak, cypress and ash. The president of the company is R. A. Hooton, Terre Haute; the vice-president, R. U. Fletcher, St. Louis.

A new corporation is the Preserved Tie Company of Kenova, W. Va., which will operate with a capital of \$150,000, dealing in lumber and timberlands and operating tie storage and treating plants and manufacturing cross-ties. The incorporators are G. A. Allen and J. B. Linn of Springfield, O.; Douglas W. Brown, M. S. Irons and Cary N. Davis of Huntington, W. Va.

The Oval Wood Dish Company, located at Traverse City, Mich., uses annually 7,000,000 feet of maple in the manufacture of wooden butter dishes. The wood is bought in the logs. The dishes are cut of steam-softened material by means of a scoop-like knife. Some, however, are made from flat veneer by fastening up the ends with wire. The daily shipments of the company average seven carloads. These go to all parts of the United States.

< CHICAGO >

J. A. Levings, president of the Moorhead Manufacturing Company, Moorhead, Miss., was in the city Monday, Mar. 24.

A. P. Bliss of Saginaw, Mich., of Bliss & Van Anken of that city, as well as of the Bliss-Cook Oak Company of Blissville, Ark., was a Chicago visitor last week, and while here placed an order with the Kraetzer

Company for one of its wood steaming preparators for the oak flooring plant at Blissville.

C. L. Willey, the well-known veneer and mahogany man, was absent from the city for several days last week at Philadelphia, where he was called for a second time as a witness for the government in the case of an alleged misuse of the mails for fraudulent purposes against Messrs. Markley, Miller, Armstrong *et al* in connection with the redolent International Lumber & Development Company.

T. J. Peterson, prominent in Toledo lumber circles, was in town on March 20, where he met his wife, who was on her way home from a winter stay in San Diego, Cal.

James E. Dewey, sales manager of the Stearns Salt & Lumber Company of Ludington, Mich., was in the city several days last week, and favored **HARDWOOD RECORD** with a call on March 19.

H. F. Below, principal of the recently incorporated Below Lumber Company of Marshfield, Wis., was in town three or four days the latter part of last week.

J. B. White of the Missouri Lumber & Land Exchange Company of Kansas City, Mo., was in the city the early part of last week for a few days on business.

G. H. Holloway, president of the Holloway Hardwood Lumber Company, Great Northern building, Chicago, just returned from a two weeks' trip to southern mill points, getting mostly into Arkansas and adjacent territory.

Arthur Jarvis of the Steven & Jarvis Lumber Company, Eau Claire, Wis., was in town two days of last week on business in connection with that firm's interests.

R. H. Jones, secretary of the G. W. Jones Lumber Company of Appleton, Wis., stopped off at Chicago last week in conference with the local manager of that company, A. H. Ruth.

B. C. Tully of the Anderson-Tully Company of Memphis, Tenn., was in the city the most of last week on a business trip.

A. H. Ruth, local representative of the G. W. Jones Lumber Company, with offices in the Railway Exchange building, was recently unanimously appointed by the Supreme Nine of the Hoo-Hoo to complete the unexpired term of John Oxenford of Indianapolis in the capacity of Supreme Bojum.

The Ouachita River Lumber Company has been incorporated at Chicago with a capital of \$30,000 to do a general lumber and milling business. The incorporators are E. Winters, J. H. Westover and John E. Waters.

J. E. Rhodes, secretary and manager of the National Lumber Manufacturers' Association, will return on March 30 from an extended trip which he has been making for several weeks in the interests of the association.

◀ NEW YORK ▶

A committee of the Lumber Trade Golf Association will meet in this city on Mar. 29, at which time definite plans for this year's play will be made. In all probability the tournament will be held on the links at Garden City, Long Island.

H. L. White of the White Lumber Company, Johnson City, Tenn., was a visitor in town recently.

Local wholesalers and representatives of coastwise steamship lines met recently and talked over the proposed abrogation of free lighterage privileges on lumber from southern ports. The dealers made a good case and the steamship men stated that they did not wish to do anything to injure the business. Final announcement will be made later.

A petition in bankruptcy filed against George Spaeth & Co., stair builders of New York, has been dismissed.

A petition in bankruptcy has been filed against the Abramson & Engesser Company, manufacturer of cabinet work, West Forty-Sixth street.

A voluntary petition in bankruptcy has been filed by Schildwachter Carriage Company, manufacturer of carriages and auto bodies, 1885 Park avenue.

The Nassau Milling Company has been incorporated at Hempstead, Long Island, with W. F. Hofstra, president and treasurer, and C. W. Brownson, vice-president and secretary. A modern planing mill equipped with eighteen machines and 150 h. p. boiler and 100 h. p. engine will be erected at Jackson street, Hempstead. Messrs. Hofstra and Brownson are well known in the trade of the Metropolitan district and Long Island.

Robert Elliott, president of the Standard Dry Kiln Company of Indianapolis, spent a few days in New York following the inaugural ceremonies which he witnessed at Washington.

Another machinery trade visitor to New York recently was W. P. Powell, representing Wm. B. Mershon & Co., band resaw makers of Saginaw.

◀ BUFFALO ▶

One of the chief committees of the Chamber of Commerce is the entertainment committee and it usually has among its members representatives of the hardwood trade. This year President Meldrum has appointed on this committee A. W. Kreinheder and I. N. Stewart.

F. T. Sullivan is making plans for the receipt of a large amount of lake lumber this season and the boats of H. H. Salmon & Co. are now being put in shape for their first trips.

W. K. Jackson of Jackson & Tindle returned a few days ago from a trip to Panama. He was a member of a party spending several weeks in a visit to the isthmus and other countries.

Anthony Miller reports an improvement in the demand for a number

of hardwoods. He expects to make large shipments from the South soon, particularly in ash and basswood.

Blakeslee, Perrin & Darling are receiving stock from several southern mills and have been very busy of late in piling up stock in yard. Everything is reported in pretty good demand.

The National Lumber Company has arranged for the receipt of a large stock of lake hardwoods this summer, especially in birch and maple, in which trade is reported very good.

O. E. Yeager is back from an enjoyable trip to Mt. Clemens, Mich. He reports a very fair inquiry for different hardwoods, with plain oak leading and quartered doing a little better than formerly.

G. Elias & Bro. are looking for an active building season here this spring. The firm is getting a good share of the business in hardwood fittings for some of the big office structures.

Roy O. Sykes, son of President W. L. Sykes of the Emporium Lumber Company, is to be married on Mar. 26 to Miss Laura K. Scott of Syracuse at the home of the bride's parents, Mr. and Mrs. Edwin J. Scott.

The unloading committee of the Buffalo Lumber Exchange has been appointed by President A. W. Kreinheder as follows: H. I. George, chairman; John McLeod, W. P. Betts, B. H. Hurd, S. G. Taylor and H. E. Montgomery. All are lake shippers of lumber.

The Chautauqua Panel & Veneer Company has been organized at Jamestown with a capital stock of \$125,000 and will manufacture and deal in veneers for furniture making. The directors are the Setter Brothers, recently in this line at Cattaraugus, and John N. Chappel, Frank H. Mott and Louis L. Ostrander. The furniture factories of Jamestown have plenty of business on hand at present and are frequently obliged to work overtime.

The Medina Wood Working Furniture Company has been organized at Medina, N. Y., with Carl H. Breed, for many years member of the hardwood firm of Chase & Breed as president. J. William Jackson, vice-president, was formerly connected with the Maher Brothers Company, manufacturer of furniture.

◀ PHILADELPHIA ▶

Frederick S. Underhill of Wistar, Underhill & Nixon is not disposed to quarrel with trade conditions. He says the buying is in spots, slow in large cities, but the totality satisfactory. The hardwood situation is strong and prices are well maintained. After a four weeks' stay in Sumter, S. C., looking after the firm's interests, R. W. Wistar is on his way home. He will put in a few days at Pinchurst, N. C., where he will indulge in golfing, his favorite sport.

J. W. Floyd of the Floyd-Olmstead Company reports a little slowing up in some lines, but the general situation gives satisfaction, and the outlook is favorable.

Charles Atherton of Charles Atherton & Co. reports steady trading, with a noticeable advancement as the spring season opens.

J. T. Fentress of the Surry Lumber Company, Baltimore, Md., and Brooks Flowers, of the Flowers Lumber Company, Jakin, Ga., were among the recent visitors to the local trade.

Maurice W. Wiley, formerly associated with the Wiley-Harker Lumber Company, of Baltimore, has connected himself with Thomas E. Coale Lumber Company in the capacity of manager of the yellow and North Carolina pine departments.

E. M. Bechtel, sales manager of William Whitmer & Sons, says business gives no cause for complaint,—no difficulty in disposing of good stock and at strong prices. Everything indicates a good year's trading.

Fire recently destroyed the factory of the Shreve Chair Company, Union City, Pa., with an estimated loss of \$250,000.

The Pochontas Coal and Timber Company, Wilmington, Del., was chartered under Delaware laws, Mar. 17, with a capital of \$500,000.

◀ BOSTON ▶

B. D. Peterson, Jr., a dealer in cypress and other building lumber, with an office at 15 Federal street, Boston, has left Boston without letting any of his friends know where he has gone. The sudden disappearance has caused great surprise among lumber dealers in this city as they have always thought that he was doing a fine business. So far as is known no steps have been taken to incur expense to either his estate or his creditors owing to the fact that the assets are practically nothing. A clerk in his employ states that the liabilities will be about \$65,000 to \$70,000. His office is now closed.

The hearings at the State House, Boston, on the fire hazard bills were held early this month. The Massachusetts Wholesale Lumber Association and the Lumber Trade Club of Boston were represented by Arthur S. Whalen. He favored a permanent fire hazard commission. In reference to the bill, which was introduced with the idea of prohibiting the use of wooden shingles within the city limits, Mr. Whalen felt that the subject should be given further study and that it should be referred to a permanent metropolitan fire commission. A bill prohibiting the use of wooden shingles would work a hardship to manufacturers and dealers in lumber.

The long established business of the L. T. Robbins Lumber Company, Plymouth, Mass., has been sold to Swain & Boggs, wholesale dealers, Boston. The Robbins business was established many years ago by the late Leavitt T. Robbins.

< BALTIMORE >

A special committee of the National Lumber Exporters' Association appointed by President Frank Fee recently framed and adopted resolutions on the death of Frank F. Abbott, vice-president of the Penrod-Abbott Lumber Company of Brasford, Ark.

Howard W. Jackson and Lee I. Hecht were appointed receivers for the Chas. J. S. Steiner Mantel Company of Orangeville, Baltimore county, on Mar. 10, by Judge Duncan, in the circuit court at Towson. The receivership was decreed on the application of Mr. Jackson and was assented to by the company and Sady Salebes. It was contended in the petition that irreconcilable differences had arisen between the officers, directors and stockholders of the company in regard to a proposed reorganization, and that the interests of all parties would be conserved by a receivership. The assets were given as \$65,000 and the liabilities as \$36,000. The company was formed years ago by Charles J. S. Steiner, who was formerly with the Steiner Mantel Company, which operates a plant at Highlandtown and is not in any way connected with the corporation in financial difficulties.

A formal hearing of the case of Robert McLean, the hardwood exporter, who had petitioned the United States Court here for the benefit of the bankruptcy laws, was held before Thomas Foley Hiskey, acting as referee, the statement as to assets and liabilities as well as other matters being sworn to and certified to the court. Mr. McLean, as announced at the time, placed his liabilities at \$66,699.86 and his assets at \$19,465.72.

Mr. Collins, a young man who has been with Robert McLean for a number of years, has established connection with several hardwood mills and is selling lumber here on commission.

David T. Carter of the hardwood firm of David T. Carter & Co., Calvert building, will leave next week for Tennessee and southwestern Virginia in search of stocks, which are in very urgent demand. He will be away about ten days and expects to take in a considerable number of mills, but is by no means sanguine of getting what he wants, the offerings being small and the inquiry very active.

The new mill of the K. E. Wood Lumber Company at Fontana, Swain county, has been running about ten days now, but has not yet been speeded up to its normal capacity nor has it been running full time. The plant, which is of frame, on a concrete foundation, is regarded as one of the best and most efficient in that section of the country.

Paul Littig, a young Baltimorean, who was formerly with the Stirling-West Company, a corporation that liquidated shortly after the big fire, and who is now in the wholesale hardwood business at Roanoke, Va., was in Baltimore last week and called on a number of his old acquaintances. He spoke very encouragingly on the general state of the trade and his own business in particular.

Among other visiting hardwood men during the past week were H. L. Bonham, a millman of Chillhowie, Va., and F. X. Dioboid of the Forest Lumber Company of Philadelphia. Both stated that stocks are very small and that prices are either firm or higher in consequence of the urgent demand.

< COLUMBUS >

Building operations during the month of February showed a marked increase over February of 1912 according to the recent report of the building inspector. During the month of February, 1913, building operations aggregated \$225,980 as compared with \$210,251 in the same month of the previous year. Since Jan. 1 the value of new buildings projected amounts to \$434,225 as compared with \$310,251 for the corresponding period in 1912, a net gain of thirty-nine per cent. Warm weather has been responsible in a large measure for the increase. Architects and contractors are waiting for plans which will be started as soon as spring appears.

C. H. Weedon, Detroit sales agent for the W. M. Ritter Lumber Company, visited the Columbus offices recently. J. W. Mayhew, general sales manager for the same company, has returned from a two weeks' inspection trip of the mills throughout the South.

A bill to exempt woodlands from taxation has been introduced in the Ohio legislature by Representative Bayer and is intended to stimulate forestry. The bill provides that land owners after having planted trees no less than 170 per acre can have the land placed on the tax duplicate at a nominal valuation of \$1 per acre. There is some chance of the bill becoming a law.

The Theisen-Hildred Company of Napoleon, O., has been incorporated with a capital stock of \$20,000 to operate a saw and planing mill and deal in lumber. The incorporators are Albert S. Theisen, George E. Hildred, Fred C. Hildred, John Theisen, Nettie Corbett and Herbert H. Hildred.

The Portage Lumber Company has filed papers with the secretary of state increasing its capital stock from \$30,000 to \$50,000 and at the same time changing its name to the Honing Lumber Company. The concern is located at Ravenna, O.

The Fremont Lumber & Supply Company has about completed the work on the former building of the Fremont Furniture Company and several

of the departments of the lumber company are being operated. The move was made to increase the facilities of the concern.

F. B. Pryor of the sales department of the W. M. Ritter Lumber Company reports a good demand for all varieties of hardwoods with prices ruling strong. He says the movement is well divided among all the grades with the result that there is no accumulation in any place. Chestnut is in good demand and prices are high. Buying is pretty equally divided among retailers and factories.

W. B. Sissons, sales manager for the Sowers-Leach Lumber Company, has returned from a buying trip in the South. He says the demand for hardwoods is good, with stocks fairly scarce and prices remaining strong. J. J. Wyatt, the Detroit representative of the Sowers-Leach Lumber Company, has resigned his position.

L. B. Schneider, sales manager for John R. Gobey & Co., says the market is about the same, with strength shown in every variety of hardwood. There is no weakening in prices and the larger volume of business is expected as soon as the weather improves.

W. L. Whitacre of the Whitacre Lumber Company says there is a fair demand for hardwoods, with prices strong. D. W. Kerr of this company recently left for a business trip in the South.

Ray Lovell of the Reliance Lumber & Manufacturing Company says prices are good and there is a good demand for hardwoods, with shipments coming along better.

< TOLEDO >

"Business has been fair with us" was the report from the Toledo Bending Company, manufacturer of carriage woodwork. "The demand is not yet up to the standard hoped for, but I believe that this coming season is going to be a good one for us. We received a considerable set-back from the automobile industry but each coming season strengthens the belief that the automobile cannot put the horse out of business. It is a well known fact that horses cost more now than ever before and can be readily sold at fabulous prices if the stock is right. Carriages and wagons are still in large demand and I believe will be better than for a long time past as soon as the season really opens up. We have had no difficulty in securing stock and have been able to secure our supplies at a reasonable figure." This concern sent out a new price list the first of the year which showed a ten and fifteen per cent increase in certain articles, such as shafts, spokes and bows, but for the most part prices are the same as last season.

W. S. Booth of the Booth Column Company is making a trip through eastern Ohio in the interest of his company, this week.

The J. M. Skinner Bending Company, reports business fine with plenty of raw materials on hand and a good line of orders. The only complaint is that prices on products are lower than they should be.

Records in the office of the building inspector show that Toledo has gained seventy-one per cent during February, 1913, over the same month last year. Permits were issued for 191 buildings at an estimated cost of \$406,280 as compared with forty-two permits for February, 1912, at an estimated cost of \$236,917.

< INDIANAPOLIS >

The plant of the T. B. Laycock Manufacturing Company, bed manufacturer, has been sold for \$307,025.47 to the general creditors, who will operate the plant.

B. G. B. Slaymaker has been appointed receiver for the American Pipe Organ Company, Anderson, on application of the American Rotary Valve Company, creditor to the amount of \$150.

John J. Madden has bought a manufacturing plant at Sherman Drive and Sixteenth street for \$38,000 and will manufacture davenport, employing 150 people. The plant will be in operation in three months.

Caleb S. Eaglesfield, president of the Eaglesfield Stewart Company, manufacturer of hardwood flooring, has been appointed receiver in the United States Court for the Roach-Brown Manufacturing Company, manufacturer of tables and kitchen cabinets. Action to have the receiver appointed was brought by E. C. Atkins & Co. and other creditors.

With an authorized capitalization of \$5,000, the West Side Mill & Lumber Company has been organized and incorporated at Clay City to operate a sawmill and conduct a general lumber business. Those interested in the company are Frank K. Sipple, Claud Williams, William Dickey, Orville Dickey and Thomas Flynn.

The McIvaine Lumber Company of Vincennes has filed notice with the secretary of state that it has increased its capitalization by a \$20,000 issue of preferred stock.

Clothes racks and hardwood novelties will be made by the Schoenstrup-Worden Rack Company, just organized at Shelbyville by Joseph B. Schoenstrup, George Worden and Harry Minster. The company has been incorporated with an authorized capitalization of \$5,000.

< MEMPHIS >

Weather conditions in this territory during the past fortnight have been generally favorable for work in the woods and as a consequence the amount of timber brought out has been considerably above the average. During February the Valley Log Loading Company prepared 1306 cars for shipment to Memphis and other points on the Yazoo & Mississippi

Valley line of the Illinois Central railroad and officials of that company say that this not only represents a large increase over last year but that the amount of logs loaded since the first of March also shows a decided gain. The company is doing everything it can to get timber loaded for its clients but is meeting with much difficulty on account of the shortage of equipment. It says that it is impossible to secure enough cars or motive power with which to handle shipments promptly.

The amount of timber being received over the other lines entering Memphis is also quite full. There are also some logs reaching Memphis by water. The recent stage of the Mississippi river has been quite satisfactory for handling timber and those who had logs scattered by the high water have, wherever possible, collected these and brought them to the mills at Memphis or at other points along this stream. Practically all of the mills here are well supplied with timber for the immediate future and the openness of the weather makes the outlook reasonably good for an adequate stock of logs.

Conditions in this respect are in very striking contrast with last year when the unprecedented rise in the Mississippi and its tributaries began. Readers of the HARDWOOD RECORD are familiar with the fact that the stage went practically ten feet above the danger line here and that it was out of the question to operate many of the mills in the Mississippi valley and that there was so much water in the low lands that logging was impossible. In fact nearly all the plants at Memphis found it necessary to close down, and the same was true of the majority of those at the principal points in the valley south of Memphis. This year they are all running on full time and there is a plentiful supply of timber. It is officially predicted today that the Mississippi will go to a stage of thirty feet within the next fortnight but this is not causing any alarm as a stage of thirty feet is still five feet below the danger line and some fifteen feet below the record stage of 1912. There will be no overflow with such a volume of water and the outlook from the standpoint of hardwood lumber manufacturers is regarded as quite favorable.

The capacity of the plant of J. W. Wheeler & Co., Madison, Ark., has been materially increased through the installation of a resaw. The daily cut now is about 55,000 feet. The resaw has just been placed in operation. The company has also increased its boiler power and otherwise improved its plant. C. L. Wheeler, general manager of the company, was in Memphis this week and said that he considered the outlook exceptionally good. The firm has a plentiful supply of timber on hand.

The Memphis Band Mill Company has made application for a charter under the laws of this state. The capital stock is \$100,000. The new company has taken over the plant of the Memphis Saw Mill Company and is in effect a successor to that corporation. The principal incorporators are: J. F. McSweyn, O. A. Filger, George McSweyn, K. L. Emmons and A. B. Baker. J. F. McSweyn has been in charge of operations for the Memphis Saw Mill Company here for some years. W. O. Hughart and George T. Kendall of Grand Rapids were the principal owners of the Memphis Saw Mill Company.

S. B. Anderson, president of the Anderson-Tully Company, W. A. May of May Brothers, W. A. Ransom of the Gayoso Lumber Company, and Mark H. Brown of the Mark H. Brown Lumber Company have returned from the tour of Central America and Panama which was made in conjunction with the party from the Business Men's Club. They report that the trip was one of the most enjoyable they have ever made and they were quite enthusiastic over the splendid treatment accorded them by the management of the excursion. They are also of the opinion that the Panama canal will open up a very large business between Memphis and points which will be more easily reached by virtue of the canal. They think that there is a splendid chance to build up profitable trade relations with the people of Central America, and some of them are disposed to take time by the forelock and begin preliminary preparations for the enjoyment of such business.

The Columbia Land & Timber Company has been organized at Stephens, Ark. The capital stock is \$200,000. J. F. Halton is president and L. L. Tidwell, cashier of the bank of Stephens, is secretary and treasurer. The company has recently purchased extensive timber land holdings in Louisiana and will establish a mill and other facilities for the development thereof.

F. B. Robertson, sales manager of the lumber department of the Anderson-Tully Company, and C. E. Dudley of the Dudley Lumber Company, have returned from the annual of the National Wholesale Lumber Dealers' Association, at Atlantic City. Mr. Robertson was signally honored by his election as trustee. The Memphis delegation carried an invitation to the association to hold its next annual in Memphis. This will be decided by the trustees at a later date.

J. W. Dickson, president of the Valley Log Loading Company, is able to be out again. His ankle, which was broken some weeks ago, is not entirely well but his many friends are congratulating him upon the fact that he is able to be at his office.

Among the recent visitors to Memphis has been Earl Palmer of the Palmer-Ferguson Company, Paducah, Ky. He was en route to New Houka, Miss., to look after plans for the installation of a mill at that point for the development of the timber on 10,000 acres of timberland owned by his firm. New Houka is on the New Orleans, Mobile & Chicago but it will be necessary for the company to build about ten miles of railroad to facilitate the handling of the timber to be developed. A large band mill is to be established. The site for this has already been se-

lected and the machinery has been ordered. It is expected that it will be in operation within the next three months. The company considered the proposition of carrying this timber to Paducah but decided that it would be more profitable to establish a mill closer to the base of supply.

F. E. Gary, general manager of the Baker Lumber Company, Turrell, Ark., has returned from a trip to Panama and Central American points. He was accompanied by his wife and friends from the North.

James E. Stark of James E. Stark & Co., is back from a visit to points in Florida. He was accompanied by his mother and one of his children. He is looking remarkably well. He was quite busy before he left with the problem of securing lower rates on insurance for the lumber companies and, on his return yesterday, he held a conference with Commissioner Dies on this subject and promises to be quite active in this matter.

The Anderson-Tully Company has resumed operation of its box factory at Vicksburg after a suspension covering some time. The company found it impossible to secure enough dry cottonwood to keep its box factory in steady operation and it closed the latter down until it had a large enough supply of dry stock to enable it to continue without interruption. The company, however, is operating its box factory here on full time and the allied plant at Madison, Ark., owned by the Morgan-West Company is also being run steadily.

◀ NASHVILLE ▶

The local furniture industry has showed a decided growth for some months past. The Standard Furniture Company, one of the largest concerns of the kind here, has prepared for a twenty-five per cent increase in its production and has installed the necessary machinery. The company is making about three carloads of furniture daily.

Forest fires, fanned by hard winds, have done considerable damage recently in the vicinity of Clarksville, Tenn. It is suspected they were started by some lawless person or persons. Fencing, timber and other property was destroyed but no buildings are reported to have been burned.

D. B. Clayton is forming a company which will bear his name to operate an extensive lumber plant at Lewisburg, Tenn.

For a consideration of about \$6,000, the Beaver Dam Manufacturing Company of Damascus, Va., has purchased the plant of the Wilkerson-Matthews Lumber Company at a bankrupt sale. The estimated value of the plant is placed at \$30,000. The new owners will operate the plant just bought.

◀ BRISTOL ▶

The sale of the plant of the J. A. Wilkinson Lumber Company, Inc., of this city to Stone-Bluing Lumber Company, at \$16,200, was this week confirmed by the creditors at a meeting before H. H. Shelton, referee in bankruptcy. The price is a very low one, but the creditors decided to accept it. The new company will install new machinery and operate the plant on a larger scale. The yard site is included in the purchase. The creditors confirmed the sale of other real estate and personal property, but declined to accept a bid of the Ellis & Myers Lumber Company, of Salem, Va., for the dismantled band mill.

The creditors are ready to declare a dividend as soon as the referee passes on the contested claim of Price & Price, Ltd., of London, the amount of which is \$43,000. It is contended that this is a personal obligation of J. A. Wilkinson and that the corporation wrongfully undertook to assume it. A \$5,000 claim of a Bristol bank is being fought on the same ground.

George M. Spoigle was here last week from Philadelphia to bid on the Wilkinson plant.

George H. Mell of Kane, Pa., who operates in western North Carolina, was a visitor this week on the Bristol market.

Price & Pierce, Ltd., of London, are preparing to open an office in Bristol, in charge of J. A. Wilkinson, who is looking after the firm's extensive business in this territory.

The work of extending the Virginia-Carolina railroad to Wilkesboro, N. C., is now under way and is being pushed. The extension will result in the installation of several new mills.

The Bristol Planing Mill has established a mill in the Holston mountains east of Bristol and is cutting a good sized area of timber.

L. D. Gasteiger, manager of the Pittsburgh Lumber Company, was a visitor here this week. The company has a large mill at Hampton, Tenn., thirty miles south of Bristol. Senator "Bill" Flynn, the well-known political leader, is at the head of the company.

The Tug Fork Lumber Company is preparing to install a new mill near Welch, W. Va. The company was formed only a few weeks ago.

The band mill of the Peter-McCain Lumber Company in this city is closed for a short time in order to permit the installation of new machinery. The planing mill is running.

◀ LOUISVILLE ▶

Lumbermen will be interested in the hearing to be held in this city in the near future, when the Interstate Commerce Commission takes evidence on the switching case in which the Louisville & Nashville is the defendant and the Board of Trade the complainant. The Louisville &

Nashville filed its answer recently, contending that the commission had no jurisdiction over its industrial switches and that its rules were all right anyway. Lumbermen would be very much pleased to see an open-door policy laid down by the commission, although most of them have become so accustomed to the methods of the Louisville & Nashville in enforcing its "whole hog or none" ideas that they are accepted now as a matter of course.

While no decision on the project has been reached, it is possible that the Louisville Point Lumber Company will expand its operations by locating a sawmill in Arkansas. President Edward S. Shippen recently returned from the southwestern state after looking over a tract of timber which had been called to his attention. A decision one way or the other will probably be made in the near future. In case a mill is put up, most of the machinery formerly used by the Boone Lumber Company at Ford, Ky., will probably be utilized.

Company, think that they have a great proposition in the timber tract in Arkansas formerly owned by the Robe Lake Lumber Company and now the property of the Brown Brothers Lumber & Land Company. There is no intention of operating it in the near future, but it will be held for investment purposes.

Mills affected by the transit arrangements of the Louisville & Nashville are furnishing reports of the inbound log shipments and outbound lumber shipments in accordance with the tariff requirements of the road, the Southern Weighing & Inspection Bureau looking after this detail. However, the reports are now not required to be made daily, which is some help. The Louisville & Nashville has not yet changed its rules regarding substitution, but is still requiring oak for oak and ash for ash, although the Interstate Commerce Commission has stated that hardwoods for hardwoods would be an acceptable basis of providing substitution of tonnage.

Inasmuch as several local veneer mills manufacture poplar crossbanding, there was considerable interest in a conference of poplar men held at the Seelbach hotel here a few weeks ago. There was no definite object of the meeting except to talk over conditions in the trade, the feature of the situation developing in the high price of logs. It is said that for good logs suitable for veneer manufacture the highest prices in the history of the business are being paid, and that accordingly present veneer prices are out of line with the cost of production.

J. W. Park of the Elkton, W. Va., Box Company, which is one of the largest consumers of hardwoods in the package business, using about 10,000,000 feet of low-grade oak a year in the manufacture of crates for the tinplate mills, was in Louisville recently. He has a theory that too much value is being placed upon low-grade oak and not enough on the upper grades; and while he leans in the direction of cheap cull oak by reason of his position as lumber buyer for his concern, he has some good arguments in favor of his theory.

The use of the river in the transportation of forest products is being accentuated by a move of the Big Four railroad, which has acquired 400 acres of land at Brookport, Ill., opposite Paducah, Ky., and will receive barges of ties brought up the Ohio river and transferred at Brookport to the cars. The development of the river traffic through the completion of the improvement of the Ohio and the opening of the Panama canal is declared by experts to be a certainty.

J. E. Barton, state forester of Kentucky, has succeeded in getting strong sentiment stirred up in favor of the organization of a state forestry association. The idea was broached by him in a recent address in Louisville, and will be carried out, it is expected, at a meeting of the Kentucky Educational Association in Louisville, April 30. Mr. Barton and the state board of forestry are now completing arrangements for the establishment of a nursery at Frankfort. Another will be located in Louisville.

C. M. Sears of the Edward L. Davis Lumber Company, who is one of the closest observers of business conditions in the local hardwood trade, is convinced from an investigation of conditions in the furniture business that the factories in that line are going to have a big year. Most of them are buying freely and appear to be turning out goods at an unusually rapid rate.

W. P. Bolton, formerly in charge of the wholesale department of the W. P. Brown & Sons Lumber Company, and now conducting a lumber business with offices in the Peoples Gas building, Chicago, was in Louisville recently and attended a meeting of the Louisville Hardwood Club, which welcomed him as an old friend. Mr. Bolton reported conditions in the Windy City trade to be good.

Most of the Kentucky river sawmills now have enough logs on hand to insure a pretty steady run through the summer, the stream and its tributaries having offered a logging stage for several weeks, and this has been taken full advantage of.

The C. C. Mengel & Brother Company recently received the last lot of African mahogany logs which will be available until midsummer, when the results of the spring rains will be developed in the form of shipments from Axim. The company has a big supply of logs on hand at present and is cutting them up as fast as possible. Plans for its new mill are now in process of development.

← MILWAUKEE →

A thousand acre tract of hardwood timber land in Menominee county in the vicinity of Wausaukee will probably be taken over by Missouri parties, who have secured an option through Wausaukee agents. If the deal is consummated, a mill will be established on the tract, the timber cut and sawed into lumber. T. H. Marrow and Oliver Harmon of Clarence, Mo., are the holders of the option. They expect to ship the lumber into their state, where they operate yards.

The Burdick Cabinet Company has been incorporated with a capital stock of \$150,000 at Milton. Paul M. Green, B. H. Wells, T. A. Saunders, and J. G. Carr of Milton, Dr. A. S. Maxson and Prof. Allen B. West of Milton Junction are the incorporators. A factory employing thirty to fifty men will be erected between the two villages to manufacture the products of the concern.

A fire in the drykiln and wood mill of Charles Scholz, at 740 Twentieth street, Milwaukee, recently caused a damage of \$700.

Logging camps are breaking up early this spring, due to the mild weather, those camps which have long hauls being most affected by the

thaw. Unless a sudden change comes shortly, there will be little more logging this season, although logging operations have been more extensive this year than for many years past. The reason for this activity was good prices of lumber and many camps were operating that had been closed for several years. The extensive operations resulted in a shortage of help and consequently unprecedented prices for labor.

A new refrigerator, composed of an inner and outer shell of five layers of veneer each, and separated by three sheets of asbestos and two airtight spaces, is being manufactured by the Wisconsin Seating Company of New London. The interior of the refrigerator is covered with white enamel and the corners are readily accessible for cleaning, making it absolutely sanitary.

The Bartlett & Wagner Lumber Company has been formed by Wm. Bartlett, for several years owner and operator of the Clark mill in Bloomfield, and J. H. Wagner, of the J. H. Wagner Lumber Company. Mr. Bartlett has acquired the interest of A. Looker in the saw and planing mill and lumber yards of the last named company, and the new concern was formed.

The N. S. Washburn Lumber Company of Sturgeon Bay started up both the planing and sawmill for a 350,000 foot run. The sawmill will finish sawing the logs and then shut down, but the planing mill will run until late in the fall. The concern is looking forward to a good season, having already booked a large number of good orders.

The John Week Lumber Company of Stevens Point has installed a new "dutch oven" in the boiler room and has started the sawmill for its season's run. A machine for converting refuse into fuel has also been installed.

The Commercial Club of Chippewa Falls is making an effort to re-open the plant of the Stanley Manufacturing Company, which has been idle since the death of C. A. Stanley, the founder. The plant is equipped with woodwork manufacturing machinery.

A new steam drier has been installed in the plant of the Wisconsin Seating Company, New London, which makes a great improvement to the plant. With the new machine, the time between the cutting of veneer and its use in manufacturing has been shortened by several days. Instead of taking the freshly cut veneer to the dry-kiln for several days, it is now dried without handling and then taken directly to machines to be worked up into the finished product.

Courtland M. Conlee, a pioneer of the early lumber industry of Oshkosh, having been actively engaged in the lumber business with the Conlee Lumber Company, has died at his home in the state of Washington. The remains were taken to Oshkosh for burial.

Robert B. Blackburn, the oldest son of Mr. and Mrs. Robert Blackburn, recently died at Stevens Point. The father is a wholesale lumberman of Milwaukee, where the body was sent for burial.

Mrs. Margaretha Schroeder, widow of John Schroeder, the founder of the John Schroeder Lumber Company of Milwaukee, recently died at the age of seventy-two years. Mrs. Schroeder was born in Hanover, Germany, and has resided in Milwaukee since 1845. Her husband, John Schroeder, died about four years ago.

The daughters of the late Edward Bradley, pioneer lumberman who died last December, leaving an estate of \$3,600,000, have donated a memorial fund to the St. Paul's Episcopal church in Milwaukee, as a memorial to their deceased mother and father. The fund will be known as the "Edward and Alice Hall Bradley fund" and is the gift of Mrs. Robert B. Tweedy and Mrs. Spencer Hilsley. It will be devoted to the support of a visiting housekeeper to work among the poor of the city.

The Hardwood Market

< CHICAGO >

Some little complaint has been noted during the past few weeks that the local trade is not as brisk as it has been. It is, however, a significant fact that since the beginning of 1913 each month and each fortnight has experienced a greater volume of trade in lumber products, and at a greater price, than during the corresponding periods for 1912. It would seem, then, that in view of the satisfactory demand on the part of the factory trade, and falling off on the part of the trade immediately dependent upon building operations is caused by seasonal reasons, at least in part. Through the influence of a rather uncertain opening of spring, in addition to the high cost of all raw materials entering into house construction, the building season locally has not opened up as satisfactorily as had been anticipated. As a consequence, the planing mill trade is not unusually active.

Notwithstanding this present condition, however, there is absolutely no apprehension, nor is there any expression of pessimism on the part of the local trade. Values are being maintained healthfully, with some items slowly increasing, but most of them holding a reasonable level.

No change is seen in the stock conditions, although local buyers anticipate that they will have considerable dry northern stock in the near future. The relative position of the various woods remains about as it has been for several months, with oak, ash, maple and chestnut the leading items.

< NEW YORK >

The New York hardwood market shows no change in the past two weeks. The retail trade shows some decrease in demand and volume but there is no falling off in prices. Collections are a bit slow but most of the business going is generally satisfactory with every indication of greater activity. The wholesale market is strong and shows no signs of weakening. Those woods which have led the list continue in good demand and strong in price. Oak is the leader with ash and chestnut well up. Good lumber finds a ready sale and lower grades are moving in good volume.

< BUFFALO >

There is a satisfactory business in hardwoods, with a brisk inquiry for quite a number of different woods. The report coming from the furniture factories is very favorable and they have so much business

Kraetzer-cure LUMBER

on hand that many of them find it necessary to run overtime. Conditions in the different industries calling for hardwood stocks are such as to indicate that the present year is likely to be a prosperous one for the lumbermen. Prices hold firm and in some varieties are strong. Dealers who handle lake stocks are looking forward to an active season in the way of receipts from that direction.

Plain oak has been about the best seller, and the scarcity of stock has kept prices stiff. There has been an active demand for this wood for some time, and dealers could have turned over quite an amount in excess of their sales if they had had the lumber. Ash also has been in active demand, while birch and maple have been doing well, and flooring has been commanding high prices. Poplar and basswood have been selling at a good rate and are holding firm.

◀ PHILADELPHIA ▶

The hardwood situation remains unchanged from that of a fortnight ago. The buying market continues strong and prices are well sustained. A vigorous activity is noticeable in building work of all kinds in the early advent of spring weather. The wholesale consuming industries are buying freely and the railroads are contemplating extensive improvements in the near future, which promises well for an increased prosperity. Stocks at mill ends, especially in hardwood centers, are far from accumulating, and buyers are beginning to think a break in values unlikely, and consequently are making every effort for future supplies.

Plain oak heads the list in hardwoods; quartered oak holds a firm position; high-grade chestnut and poplar are about the weakest quoted at this time; sound wormy chestnut and low-grade poplar are in good demand; ash is stronger; birch, beech, cherry and basswood maintain good places; the mahogany and veneer market is strong.

◀ BOSTON ▶

There has been a fair volume of new business reported in the market for hardwood lumber. Both manufacturers and dealers are firm in their demands for full prices. The tendency upon the part of manufacturers is to ask higher prices. Some buyers admit that they look for further advances as soon as they begin to purchase in larger lots. The stocks of dry lumber at the mills are not large, according to reports that are received here weekly and large wholesale dealers are not overburdened with supplies of desirable stock. Dealers in this market state that they find it harder to locate lots of desirable hardwood lumber this spring than ever before. Manufacturers show no anxiety to make sales. The large consuming manufacturers in this market are fairly busy.

There has been a good demand for veneers at good prices. Demand has been unusually brisk this spring and a further increase in business is looked for. One of the features of the hardwood market is the strong demand for plain oak and the strong prices at which it is held. During the past few months the position of this lumber has been growing stronger until today prices are higher than they have ever been. Quartered oak has also been enjoying a very good demand with a larger volume of business than for some time past. Walnut is very firm with offerings small. Maple has been in fair demand in this market.

◀ BALTIMORE ▶

There is no reason whatever for changing the verdict on the hardwood trade which was passed a month ago, except in so far as to state that prices are either very firm or still on the advance. Because of an active demand throughout the winter, or in consequence of a restricted production, stocks at the present time in nearly all divisions of the trade are far from plentiful and dealers find it difficult to provide for their wants. The experience of a hardwood man here will serve to illustrate the situation. He had occasion to send out some letters of inquiry, and, receiving a reply from one of the correspondents, he promptly accepted by telegraph, only to be informed by return mail that his message came too late and that the lumber had been placed with another firm. Instances are related of dealers sending out tenders and getting acceptances from every one of the concerns written to. Under the circumstances it is only natural that the quotations should continue to advance. But for the fact that lumber is about as high as it can well go, there would be practically no limit to prices. A further advance has taken place in sound wormy chestnut, which grade is from \$3 to \$5 higher than it was last summer. The higher grades of chestnut are also in very good request, and the same can be said of ash and other woods. Poplar is about holding its own, with wide stocks just a little more active, but with the list in the main unchanged. Some of the exporters report an easing off in the demand for boxed hearts on the other side. They say that the short lengths have declined decidedly more than the regular sizes, the former bringing perhaps \$5 per 1,000 feet less than they did with prices at the top notch, while the decline of the long lumber amounts to about \$1, with an average of \$2.50. For a time boxed hearts brought an average of 2s 7½d, but now stocks 15 feet 6 inches are quoted at 2s 7d, with planks under 15 feet at 2s 4½d. The decline is attributed to inordinately heavy forwardings of short lengths, the mills sending such stocks over and taking a chance on them, together with the long lengths. The foreign trade does not take kindly to the short lengths and has seized the opportunity of liberal supplies to depress prices.

The rest of the foreign trade business seems to be in very good shape, with stocks not excessive and with the outlook for a continuance of activity encouraging.

— < COLUMBUS > —

While the weather has not been the most favorable during the past fortnight, trade in hardwoods has been active in this market. The demand for all varieties has been good, which, coupled with short stocks, has resulted in high prices all along the line. Every change in quotation has been toward higher levels while there is no weakness in any particular.

One of the best phases of the market is the demand on the part of both yards and manufacturing establishments. Both are buying well and the result is a good movement of all varieties. Factories engaged in making furniture, implements and vehicles are the best buyers on the local market although other concerns also are buying well. Factories are not stocking up any, and their purchases are for immediate wants only. Yards are inclined to stock up some in anticipation of a better demand when the spring building season opens. There is every indication of an active building season as architects and builders are busy on plans.

The movement of all of the grades is fairly uniform and there is no accumulation in any item. Oak and chestnut are probably the strongest points in the market. Both plain and quartered oak are in good demand and extra high quotations are maintained. Chestnut is moving well and sound wormy is very strong. Poplar is better now and automobile concerns are buying the wide sizes better. Ash is stronger and the same is true of basswood. Walnut is moving some. Other hardwoods are unchanged. Collections are reported good in every section.

— < CINCINNATI > —

The fine weather that has been much in evidence during the last several weeks would seem to indicate that spring has arrived. Yard men have worked under most favorable conditions and yards have been placed in the best possible shape to take care of the heavy receipts from southern producing points that have been arriving steadily during the last few weeks. Stocks of fairly good size are now in the hands of wholesalers at this point and the assortment is quite satisfactory except in some items that have been in such steady demand as to make it practically impossible to accumulate anything worth speaking of. There seems to be no end to the demand for all grades and thicknesses of plain oak and ash, quartered oak is also in active demand. Low-grade hardwoods suitable for box making purposes are very scarce and difficult to accumulate.

The outbound business is on the increase and wholesalers are receiving many inquiries for most of the hardwoods, indicating a continuation of the present satisfactory demand from the big wood consuming factories of this section. The furniture trade is holding up so well as to assure a steady demand from that source, while the box factories are continuously calling for material. The demand for hardwoods from the planing mills is increasing and should increase more rapidly from now on as the season is almost upon us for a big demand for this class of manufactured stock. The implement works all over this section are very busy and have been big consumers of stock suitable for their purpose. Dealers in hardwoods are more than satisfied with present conditions and are much encouraged over the prospects for a very early and heavy demand for all of their product. There is not at this time any weak item on the list and prices are holding up strong with no indications of any break. Manufacturers declare there is no possible chance for lower prices to prevail this season.

Demand for common and better poplar is on the increase, and prices remain firm. Wide stock is in much better call and dealers feel very much encouraged and quite well satisfied with conditions. Low grades are much sought after and are very scarce with prices very high.

— < INDIANAPOLIS > —

There has been a decided reaction in the local hardwood market during the last two weeks. As one wholesaler expressed it, the bottom appears to have fallen out all at once. Dealers are reported to have practically as large stocks as they wish to carry, considering the present high prices. Manufacturing concerns using hardwoods are said to be fairly well stocked.

At the present time, the volume of business is much less than during the corresponding period of last year. During the first three and one half months of this year, however, the volume of trade was better than for the corresponding period of last year.

There is considerable inquiry for inch stuff, which local wholesalers are having difficulty in getting. Prices are excellent and promise to hold their own for some little time to come.

— < TOLEDO > —

There is a considerable scarcity of hardwoods on the Toledo market, especially dry stocks, and local yards stocks are far from being well filled. Plain oak continues a leader both as to demand and prices. Quartered oak is bringing good prices but it is not so strong in demand. One of the most wanted materials here at present is birch, which is in great demand by furniture concerns. Basswood is being used heavily as a substitute for birch, which is so scarce and high that few of the whole-

Log

**Was Opened Up Yesterday
March Twenty-Fourth**

on our brand new band mill. All our logs are genuine African stock and our predictions as to their quality are being well borne out by the beautiful figure—ideal for high-grade piano, furniture and other cabinet work—that is shown in the flitches.

In a few days our slicer and three veneer saws—the last word in design, manufacture and installation—will start turning these flitches into Veneer.

Buyers will do well to consider our stock and facilities for perfect manufacture before placing orders.

In addition to a splendid assortment of mahogany logs our log yards contain a fine lot of selected Indiana white oak which we will manufacture shortly.

We invite your inspection and would appreciate your inquiries.

A Remarkable Shipment of Mahogany

For the past two weeks we have been unloading at our Chicago plant the most remarkable shipment of mahogany logs we ever received.

This shipment fills several cars and is made up of nearly six hundred selected logs.

Every precaution was taken to insure as far as is possible in mahogany only such logs as will produce the very highest type of mahogany veneer for high-class cabinet purposes.

Those logs already opened up reveal an amazing quality, character and variety of figure. We will secure from this shipment some brilliantly mottled wood for high-class piano manufacture.

Unusually good stock for furniture purposes has already been cut from this shipment and a very considerable quantity more is insured.

Altogether, judging from what has already been shown, this shipment will place upon the market the finest stock of mahogany veneer that has yet been turned out at our plant.

Buyers are already too familiar with our perfection of manufacture to need further explanation of our methods.

Users of mahogany visiting Chicago are earnestly invited to call and inspect the Willey plant and veneer and lumber warehouse at Robey Street and Blue Island Avenue. Blue Island Avenue car at the postoffice to Robey Street.

C. L. WILLEY, Chicago

Largest Mahogany Veneer and Lumber Producing Plant in the World

sale concerns are able to secure it. Ash is in good demand but poplar is waning somewhat. There is a fair demand for hickory and prices are high.

Builders are waiting for an opportunity to begin operations and a few warm days held out considerable hope of an early season. There are several new up-river additions to be opened and a boom is also presaged for Air Line Junction, a suburb of Toledo, where the Lake Shore railroad is expending \$3,000,000 in yard and shop improvements. Building has already begun in that section and, according to architects' plans, building there will be heavy this summer not only in residence structures but in investment structures as well. The work has begun of tearing down old shacks in what is known as Toledo's "murder district" near the court house, where the new civic center will be built at enormous expense, the first building to be constructed there this summer. This building will be a city hall. Large quantities of hardwood will be used in the structure.

← NASHVILLE →

The local lumbermen continue to do a thriving business. For the past two weeks, however, the local market has been devoid of specially interesting or important features. It is confidently believed that greatly increased activity will be noticeable with the opening of the spring season, activity which will benefit not only the manufacturers of hardwoods but the retail trade as well, for the latter is promised all they can comfortably handle, with the large amount of building in prospect. The prevailing prices are still stiff, and there is a good general call for all desirable stock. Good dry stocks are still low, however, and hence hard to get. There is an increased demand for ash and good calls for plain oak. Quartered oak is moving well; there is activity with gum and chestnut, and there is a good call for cottonwood and low-grade poplar. The millmen, especially those in the country sections, are behind with their orders and are making strong efforts to keep up with the demand, but have been held back by bad weather, which has also handicapped the log operators and prevented them from hauling much to the railroads for shipment. This has caused light receipts of logs here, but the shipments will be materially increased with the advent of good spring weather.

During February there was a decided hesitation noticed among buyers, but this is not to be seen just now, and there are plenty of orders to be had at prevailing prices from all needing stock. There are still comparatively few orders for future deliveries, however, and the producers show little disposition to book orders for future deliveries. The stocks of a desirable character being low, producers feel that the demands will increase with added spring calls, but the buyers seem to feel that prices will go down if the present rate of production continues.

← BRISTOL →

Hardwood men of this territory report that orders are not coming in as rapidly as they have been, but they are not complaining, and feel that a short breathing spell will be of advantage to business, as most of the mills are oversold and working overtime in an effort to get up their orders already booked. The outlook is considered very favorable and it is generally thought that 1913 will be a splendid year for the trade.

← LOUISVILLE →

The demand for hardwoods shows no diminution in strength, and the price list is continuing on an extremely firm basis, though advances have not been numerous. The strength of the market is of a satisfactory character, however, and apparently means that lumbermen will be able to do business under favorable conditions for many months to come. More lumber is coming into the market with the opening of the spring season, which has released a good deal of stock cut up at the small interior mills; but this has been snapped up so quickly that it has not had a chance to make itself felt as a bear factor. In fact, there are no conditions of this type which could have much weight in the face of the big proposition that consumers need lumber, that they are working their factories at full speed, and that they are not trying to analyze conditions with a view to getting prices down a little, but are chiefly concerned with getting the material on their yards and turning it out in the form of the finished product. Companies which have contracted for their lumber are specifying freely, and those which buy in carloads are rushing shipments through in jig time. Plain oak continues to be a best seller, with red going best, but plain white also being absorbed as soon as offered. Poplar is improving and quartered oak remains strong. Ash is scarce and high in price, and cottonwood and gum are moving briskly. Thick hickory has been in demand lately.

← MILWAUKEE →

The scarcity of dry stocks is causing more and more uneasiness as the season progresses and predictions are being made that considerable difficulty will be experienced before new stocks begin to arrive. Basswood generally makes its first appearance early in May, but birch and other lines will not begin to arrive to any extent until June. Business is naturally curtailed in some lines because of the shortage, as buyers are inclined to take only enough to meet their present requirements. The

immediate wants of the trade are increasing daily, however, with the advance of the season. Prices in some lines, particularly in birch, oak and maple, have advanced recently. It is reported that maple flooring has advanced about \$1 per thousand during the last two months.

Logging operations in northern Wisconsin are about at an end, as a result of the warm weather which is being experienced. Some of the camps with only a short haul to contend with are still in operation, but the majority of the camps have broken up. Very few logs have been left in the woods, however, as efforts have been made to keep them hauled out this season. Reports from lumbering centers say that despite the shortness of the season, the total log output this year will be considerably above the average.

Building operations in Milwaukee are fully up to the average and the indications are that the record of last year, when the total amount of building exceeded \$15,500,000, will be exceeded. Building permits for the week ending Mar. 15 soared well above the \$100,000 mark, bringing the figures of the month to date for permits issued by Building Inspector W. D. Harper to three times what they were at the corresponding time a year ago.

Receipts of oak from the South are as light as ever and wholesalers say that they are having trouble in meeting the demands of the trade in both plain and quartered oak.

◀ GLASGOW ▶

The carters' strike in this district having now been settled, business has begun to pull up and in some instances it is decidedly brisk. Merchants are more anxious to buy from what stock is available and at enhanced prices. Removals from the quays are now proceeding briskly but it will take some time before the congestion is cleared. Imports of late have comprised of spruce deals, birch logs and American hardwoods. Both spruce and birch timber have sold well and fair prices have been the rule. Shippers here are not too well pleased with the results of these consignment parcels of spruce as compared with other ports. It must be borne in mind, however, that parcels have been going into some other ports with fair regularity with the result that prices have eased up gradually, while to this port consignment lots have been few and far between, hence the difficulty of getting buyers to face high prices all at once.

The import of Riga deals to this market must also of course be taken into account. The shipment of American hardwoods per steamship "Marina" has sold particularly well and some little difficulty has been caused through wagon builders, who are particularly busy, not being able to get delivery of goods bought. The oak, walnut and poplar logs are reported to have been sold at good figures. The lull in the pitch pine market still continues and seems to be general in all the markets. Chartering from the gulf is very slow although two fixtures are reported at considerably less than rates current a few weeks ago.

Several fixtures of steamers are reported to carry spruce deals from New Brunswick and Nova Scotia at about £1 per standard over last year's rates and taking into consideration the increased f. o. b. price, dear spruce is inevitable.

Ash and hickory logs are selling well and a number of contracts for fair lines are reported during the past few days. Quebec timber contracts are practically unknown, so far only a few contracts for deals having been closed. Gaboon mahogany, of which there was a large import the latter part of 1912, is now being quoted at over 2s for stock to come forward, which represents a considerable advance over prices current last year.

◀ LIVERPOOL ▶

Market conditions are keeping quite brisk though values in many instances show considerable reductions. This is regarded in this market as a more healthy state of affairs as the general opinion is that prices were too inflated. At the same time the reduction in values has frightened buyers of the market and at the moment there seems little inclination to buy any stocks except for immediate requirements. Shippers are advised on no account to send stocks on consignments wherever they can avoid doing so. The market is in no mood for large shipments of the character and if any volume of stock comes, quite an extensive slump will surely follow. The position of hickory is an excellent testimony of the tendency of the market. Consignment parcels have arrived during the last few months in quantities quite out of proportion to the demands with the result that the market price has had to be reduced. In fact hickory has not been bringing as much during the last month as ash, which is of course quite absurd.

Round ash is very firm and buyers are all keen to purchase. Lumber is also good. Prime parcels are moving promptly and buyers now are not so keen on the "white" stipulation. Hard brown ash is quite salable though it is difficult to define this description in a contract.

Birch stocks are very low and the new wood should come to a good market. Few sales have been reported but they do not seem to be extensive. The cheaper lumber stocks are coming forward with freedom and are meeting with a ready acceptance from buyers.

The mahogany position keeps firm. General anticipation seems to be that prices will show an early reduction and in all probability the market would be more healthy at lower figures.

INVESTMENTS

If satisfactory they must be safe and profitable. Timber investments are both.

Certain fundamentals must be taken into account in buying timber. The buyer should know something of the intrinsic value of the timber. It should be bought at an opportune time. It should be protected from fire and other enemies. It should be resold or manufactured when the time is ripe.

Such procedure calls for intimate knowledge, such as we have acquired during our connection with the timber trade of America embracing a third of a century.

Our faith in timber is as firm now, when it commands high prices, as it was years ago when timber was sold by the acre at nominal prices.

We make a specialty of managing timber investments, carrying on the detail work from date of purchase to date of sale, our compensation being a part of the net profits.

We will handle an investment for you on that basis.

If you wish to share in the profits to be derived by those who buy timber and hold it until needed, investigate this offer.

W H Y ?

WHY DO more than 320 of the most prominent and successful lumber manufacturers exchange nearly \$26,000,000 of indemnity against fire loss at

Manufacturing Lumbermen's Underwriters

B E C A U S E !

- BECAUSE** it is the oldest and strongest inter-insurance association among lumbermen, being now in its fourteenth year.
- BECAUSE** \$728,910.41 cash savings have been returned to members.
- BECAUSE** \$756,787.21 cash surplus, owned entirely by the members, has been accumulated.
- BECAUSE** \$2,012,427.96 has been paid in losses under prompt and equitable adjustments without resort to quibbling or technical controversy.
- BECAUSE** it was the first to settle lumber losses on a market value basis.
- BECAUSE** the regular, frequent and thorough inspections given the plants of all members help them to prevent fires, thus materially reducing both the fire waste and the cost of indemnity.

MISCELLANEOUS

WANTED—HARDWOOD LUMBERMEN—

to try the Gibson Tally Book. The three-throw aluminum tally ticket cover accommodates any form of ticket desired. The use of the special triplicate tally ticket supplied, printed on water-proof paper with carbon backs makes tallies unalterable. For durability, convenience, accuracy and for systematizing the inspection of lumber the Gibson tally method can't be beat.

Special forms of tally tickets mailed on application. Covers sold on approval to responsible concerns.

HARDWOOD RECORD,

537 So. Dearborn St., Chicago.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

EASTERN REPRESENTATIVE, John L. Cochran
601 W. 115th Street, New York City

YOU pay a *little* more for our hardwood lumber than you do for many others', but it's worth *much* more.

With our modern and first-class equipment and expert operatives, we couldn't make bad lumber if we tried to, because the *quality* and *size* of our virgin tough mountain white ash, red birch, yellow poplar, buckeye, maple, red oak, cherry and basswood, averaging less than three logs to the thousand, and 95 per cent sixteen feet, is the best type of hardwood timber growth in the United States, and shows a larger percentage of *firsts*.

If you are a discriminating buyer, let's get acquainted.

A floor to adore

For thirty-three years Wilce's Hardwood Flooring has been among the foremost on the market and because it stands today "unequaled" is the best evidence that its manufacturer has kept abreast of modern methods and the advanced demands of the trade. To convince yourself of the above statements, try our polished surface flooring, tongued and grooved, hollow backed, with matched ends and holes for blind nailing—you'll find it reduces the expense of laying and polishing.

Our Booklet tells all about Hardwood Flooring and how to care for it—also prices—and is free.

Profit for Both of Us

A cigar dealer of our acquaintance has adopted for his slogan, "If you don't deal here we both lose money"; and likewise, "Doing business with me is like making love to a widow: you can't overdo it."

Both propositions are equally applicable to the Louisville hardwood market, only more so.

You can make money on lumber bought in Louisville, no matter what your requirements are, because Louisville is so situated as to be able to draw the greatest possible variety of lumber from every producing section of importance with the least expense. Hence it is possible to save the money that is necessarily spent in visiting many markets by confining attention to local yards. We have the goods, which are made right and priced right, and will please you whether you are a dealer or a consumer.

By the way, that Ohio river flood is not interfering with business, as conditions are practically normal in this market. Only a few of our members were in the flooded districts, and they are ready to do business today.

Review and Outlook

General Market Conditions

AN ACCURATE ANALYSIS of market conditions and developments during the past two weeks and of the effect of such developments on trade in the immediate future is difficult, because of the many events which have transpired having a direct bearing on lumber production, transportation and consumption. The one event, of course, which will have the strongest significance in the lumber trade is the devastating flood condition which has been felt throughout the entire middlewest hardwood producing and consuming territory. Perhaps the most notable feature of this flood is the fact that it was strongest and did the most damage in the consuming territory rather than as usual in the producing sections of the country. As a direct consequence of this, a vast number of hardwood consuming plants were shut down for days and probably it will be a considerable period before they will have straightened things out sufficiently so that they can resume normal operations.

As a further consequence of the floods in the consuming territory, a vast quantity of lumber in consumers' yards has been flooded and by silt and sand rendered useless for the purposes for which it was intended.

Thus on the one hand we are faced with the condition which takes these factories entirely out of the market for a considerable period, cutting off a goodly percentage of the total hardwood consuming field; and on the other hand, these same consuming factories are faced with the necessity of immediately filling a considerable void caused by stock which has been rendered worthless by high water. Most of these consuming factories, furthermore, produce articles of household furnishings such as furniture, tables, etc., immense quantities of which stock was destroyed in the floods. This will cause an immediate and enormous demand for a new supply. The logical place, it seems, to secure these articles is from the territory adjacent to the flooded areas. Hence, it seems probable that because of this accentuated demand the furniture, the table and other factories in the flooded territory will be more than normally active. When in addition to this is considered the fact as stated, that they lost a considerable quantity of lumber they already had on hand, it would appear to be quite evident that the temporary loss resulting from the removal of these factories from the purchasing field temporarily, is much more than offset by the increased demand resulting from flooded conditions. The natural conclusion is that these conditions will result in very materially strengthening market values on hardwoods.

A further condition must be considered also, which will have an equally strong bearing on market prices. Probably the heaviest

sufferers of all the industries affected by the floods are the railroads. In several cases complete lines were swept away, and every system or individual company maintaining railroad service in the flooded territory was affected to a large extent. Bridges were swept away, stations demolished, trackage utterly ruined. Hence, the railroads are facing the immediate necessity of rebuilding these various structures including buildings, trestles, bridges, tracks and all kinds of structures. The effect of this condition is not theoretical, as an acute demand has already been noted on the part of the railroads. In fact, so anxious are they to secure stock for immediate reconstruction that they are paying fabulous prices for almost any kind of green hill stuff and timbers. The result of this will be that vast quantities of timber, instead of being turned into lumber as under ordinary conditions, will be absolutely taken out of lumber production and will entirely be cut into bill stock, construction timbers, and similar stuff needed by the railroads for immediate use.

Hence, a still further reason is seen here why lumber must necessarily be strong because of the floods. In addition to this, of course, a very apparent condition is affecting the home builders themselves. While the average home builder affected by the flood is not so well able to recuperate as a railroad corporation, still a great many of them are, and those that are not will be backed by outside parties or will be supplanted by outside parties who will furnish the necessary capital to finance the reconstruction of the homes throughout the flooded district. This will undoubtedly result in a tremendous increase in lumber demand.

Thus it can be immediately seen that there is only one possible trend of lumber conditions,—the demand will increase; values will rise. Northern hardwood producing and distributing sections not affected by the floods have already felt this condition.

When it is considered that under normal conditions, had the floods and cyclones not occurred, the demand would have continued in excess of supply, the position of the lumber trade is still further strengthened. One of the most difficult conditions to overcome as affecting the flooded territory particularly, has been the matter of shipping stock in or out. Transportation service has, of course, been practically nil, although at this time it is getting back again to somewhat normal conditions.

There is every reason to believe that these unusual conditions will result in a material detriment to logging operations. Loggers have already been seriously affected by high water, and as a consequence there is a probability that production will be reduced considerably. Production, of course, ceased entirely at those mills which were flooded, or whose sources of log supply were entirely cut off. Even if these mills resume on a normal basis and

APR 1 1913

continue so with an average quota of logs, the loss in operating days will have a very serious effect on the total hardwood production in southern hardwood territory.

It is probable then that the next few weeks or months will see hardwood producing plants either forcing drying or shipping partly dried stock. This state of affairs even now prevails in some items, and with the new conditions it will be the rule rather than the exception.

Spring has come all over the country, and with it the usual building activity, which this year seems to be abnormal.

Next to Nature

THE COVER PICTURE which illustrates this issue of **HARDWOOD RECORD** has in it the call of the wild. During the shut-in months of the winter the town and the city are quite satisfactory, but when the shortening noontime shadows announce that summer is on the way and due to arrive within a few weeks, the woods are filled with temptations which are hard to resist.

The picture represents a trout stream in the basin of the Middle prong of the East fork of Little River, Sevier County, Tennessee. The scene is included in the holdings of the Little River Lumber Company of Townsend, Tenn. It lies near the center of a tract of 85,000 acres which the government recently purchased for incorporation in the series of national forests which will ultimately include most of the elevated watersheds of the southern Appalachian ranges. The government's purpose is to save and restore, by checking forest fires, and giving nature a chance to bring back the forest growth which has been partly or totally destroyed over considerable areas. There is no need of any restoration in the choice nook shown in the picture. The work of nature has not been disturbed in that place, but many other places have not been so fortunate.

The scene is typical of many localities among the high mountains. It is a hardwood forest, rich, rugged and restful. The largest tree is a veteran yellow poplar, its roots among the rocks, and its crown not visible in the picture, but it may be taken for granted that its limbs expand in the sunlight above the tops of the trees with which it is associated. The leaning tree which hangs over the waterfall appears to be a birch, a tree which flourishes very well in the shade. Although it is not possible to identify in the picture all the trees in sight, it is not improbable that twenty or thirty kinds are visible in that small area—a larger number of species than grow naturally in the whole continent of Europe.

The streams that flow down those mountain slopes are perennial. They are fed by springs which never run dry. Rains are copious, and between showers the skies are blue, the air is fresh and nature is seen at her best.

Flood Problems

THE RECENT DESTRUCTIVE HIGH WATERS have renewed the agitation for measures to prevent floods, but it is much easier to agitate than to devise practical measures on a scale large enough to accomplish the desired results. Whenever six inches of rain falls in thirty-six hours over several thousand square miles, there will be a flood, and it is beyond man's power wholly to prevent it. The amount of water is so great that no artificial means can be devised for taking care of it, and rivers will overflow. However, it is possible to do something to help the situation. If levees had not been built along the lower Mississippi river, much of the fertile land along that stream would be practically useless. It is, therefore, apparent that it is possible to do something, and the question now is, how much can be done.

Three methods of handling floods are advocated. First, improve forest conditions on the upper slopes of mountains; second, strengthen levees and clear channels in the lower courses of streams; third, store storm water in enormous reservoirs, thus holding it back until the crest of the flood has passed. Each one of these methods has its limitations. Land of great value for agriculture cannot be turned back into forests; the construction of reservoirs of large size must necessarily take broad valleys, most

of which are already occupied by railroads, towns and cities; and there is a limit beyond which levee building cannot go. All that can be done by man's ingenuity is to work within the limits set by circumstances.

The worst part of the flood occurred in Ohio and Indiana, where most of the deforesting was done long ago. Conditions in that respect have not greatly changed in recent decades, and for that reason the flood cannot be accounted for by forest destruction in late years. Had the flood occurred in the southern Appalachian region, deforestation of mountain slopes would have been charged directly with the responsibility.

The three methods of flood prevention can be combined. Even in Ohio and Indiana a good many hillsides ought to be growing trees instead of corn. The forest forms a mass of litter, roots and loose soil, which holds back for a time a considerable part of sudden or unusual rainfall. A little of the flood's crest could be taken off in that way. Reservoirs in which much of the sudden runoff may be caught can be built. In case of moderate freshets, these alone might suffice to prevent floods, while in time of extraordinary rain a few feet might be taken off the crest in the lower streams. A foot or two might save millions of dollars. Reservoirs of that kind should be built near the sources of tributary streams, and seldom on the main rivers. This has been done in Europe, particularly in France, and while those countries still have floods, conditions would be much worse but for the reservoirs.

There will now be much discussion of the whole matter. It is understood that bills are being prepared for the consideration of Congress. The real work, in the way of flood prevention, must be done in accordance with plans drawn by engineers, but public approval must stand back of the movement or little will come of it. One of the questions which is already being discussed is whether the government or the states should take charge of the work. There might be a combination, and probably will be. If the building of reservoirs becomes part of the plan, the development of electricity by the stored water will be important. It would be of enormous value near manufacturing centers, and it has not yet been settled whether the states in which reservoirs lie, or the general government should regulate the sale and use of this power.

Forestry Work of the Pennsylvania Company

ABOUT FIVE MILLION TREES, all told, have been planted by the Pennsylvania Railroad Company for forestry purposes. Of this number about one-half are now living. The earliest plantings were of black or yellow locust and it was confidently expected that durable ties and posts could be produced in a comparatively short time. Hopes were blighted, however, by the appearance of the locust borers, which completely riddled the trees with their destructive galleries. A section of the tree trunk attacked by the borers resembles nothing so much as a pile invested with the destructive terebrator.

The company has a regular forestry department in connection with the work of timber inspection and timber treating. It maintains a nursery where trees are grown from seed not only for forest planting but also for ornamental purposes. Most of the company's own land suitable to restocking has been planted and considerable attention is now being devoted to reforesting watersheds of various municipal water supplies in which the road is interested.

About seventy per cent of the trees now being planted are hardwoods. The principal species is red oak, since this is a tree which makes rapid growth even on rather poor soil and produces timber desirable for ties after preservative treatment. On some of the better sites black walnut is being tried while along streams and coves some ash is being introduced.

The company formerly had a considerable mileage of Osage orange or bodark (bois d'arc) hedgerows along portions of its right-of-way. It was discovered, however, that tree is a host for the San Jose scale, which has proved so destructive to orchard trees. As a result the hedgerows are being removed at the rate

of about five miles a year and some forty miles remain. It is unfortunate that Osage orange harbors the disease as the trees grow fairly rapidly and will produce fence post material of unsurpassed durability. It is not, though, in any sense a tie proposition as the trees rarely attain large size and are usually very crooked.

Canada's Lumber Output

A REVIEW of the report of Canada's lumber cut in 1911 may be found elsewhere in this issue of HARDWOOD RECORD. It is worth more than a passing thought, and is published at an opportune time, in view of the bill now before Congress to admit lumber into the United States free of duty. An important point is that, except aspen, balsam of Gilead, and birch, Canada is cutting very little hardwood; and the amount of softwoods passing through sawmills in that country is considerably less than has been generally supposed. The figures show decline in several places and no great increase anywhere. The sawmill values of lumber are not low enough to make it probable that large shipments will be made into the United States, even if the duty is taken off and Canada does not collect an export duty. The report does not give figures on pulpwood, and that is generally considered to be a resource in which Canada is comparatively rich.

An Extravagant Disease

PIONEERING IN ANY ENTERPRISE is beset with difficulties. Pioneering is expensive. Results are long of consummation, and even eventual success is conjectural. Suggestions of radical changes in systems and processes are looked upon with little favor by the average business man. He resents the suggestion that better systems of accomplishing results than those employed by him for years are possible. He is far from keen to even investigate new methods. These observations apply to business methods in general, but especially so to nearly every phase of lumber production and utilization.

This almost resentment of the introduction of anything new may be termed a disease, which, for the want of a better name, may be called pig-headedness. Every monthly innovation in logging, lumber manufacturing, lumber handling, lumber seasoning, lumber grading and lumber marketing has encountered the same series of difficulties before finding general and appreciative adoption.

The inventor of the muley saw had his troubles in securing its adoption in place of the whip saw. The advent of the circular saw, which supplanted the muley, also had its difficulties, and it was a long time before this type of sawmill came into general use. When experiments first demonstrated that the band saw was an improvement over the circular, the entire lumber manufacturing trade looked at the innovation askance,—but the band finally won out.

The introduction of rotary cutting flooring machines was so resented, that their introduction in Philadelphia in the late 40's, caused nothing less than a riot. But who today would think of making flooring save by the use of machines for this purpose?

The inventors of steam log loaders and steam skidders have also had their troubles, and it is only within the last few years that these wonderful money-saving machines have come into general use. When log loaders were first introduced into timber, the average lumberjack took to the woods. He was "gun-shy" of the outfit, and it took him a long time to get over it.

This has been the history of all innovations looking to increased efficiency and attempts at lowering cost in woods work and lumber production. The disease of pig-headedness has not yet run its course, because it is just as difficult today to introduce innovations in any feature of the trade, as when the attempt was made to supplant the muley with circular.

Perhaps too many lumbermen are too easily satisfied with their own existing systems of accomplishing results. Usually they are very busy men, and they are tied down closely to their particular occupation. A good many of them are not readers of the lumber-trade press, and do not keep up with new suggestions or new inventions. Comparatively few of them are travelers, who

visit the operations of their confreres in the business; and hence, again little opportunity for seeing new and improved methods. They are satisfied with their own way of doing things.

The late Marshall Field had an axiom that is worthy of quotation: "The man who condemns or turns down any proposition without having first acquainted himself with all the details relating thereto, confesses his ignorance and stupidity."

The wise men in the lumber trade confess not only to themselves, but to their neighbors that probably not fifty per cent of ultimate efficiency has been attained in lumber production. There is lots yet coming to lumber manufacturers in learning better methods, better systems, and better details in every feature of the lumber business, from the stump to the delivery of the lumber to the eventual consumer. Hence, it is worth while for every man connected with this industry to investigate and analyze everything that is suggested, that this monumental inefficiency may be corrected, and better and more profitable methods be constantly secured. Pig-headedness does not pay,—enterprising progression does pay.

Mechanical Properties of Wood

THE FOREST SERVICE has published Circular 213 dealing with the mechanical properties of forty-nine woods of the United States, tested in the green condition. The tests were made on 25,000 specimens, in order to reach reliable averages. Work was carried on in co-operation with the universities of Wisconsin, Purdue, Colorado, California, and Washington. The figures obtained are of interest chiefly to builders and architects. Osage orange cut in Morgan county, Indiana, is shown to be the strongest in the list of forty-nine, the mockernut hickory from Webster county, West Virginia, is second; while the stiffest wood is this same hickory from West Virginia, and the second stiffest is pig-nut hickory from the same locality. The weakest is Engelmann spruce from Colorado, and the lowest in quality of stiffness is arbor-vita from Shawano county, Wisconsin.

Foreign Tariff Information

MANY AMERICAN MANUFACTURERS AND EXPORTERS are apparently unaware of the facilities in the Bureau of Foreign and Domestic Commerce, Department of Commerce, for answering inquiries concerning the customs duties and customs regulations of foreign countries. Such inquiries are often addressed to American consular officers in foreign countries, as well as to commercial agencies, information bureaus, and foreign consulates in the United States. Replies to inquiries addressed to United States consular officers can be expected only after the lapse of considerable time. In many cases commercial agencies and information bureaus obtain their tariff information either from this bureau's publications or through special inquiries addressed to this bureau, while certain foreign consular officers in the United States frequently refer tariff inquiries to this office. It is therefore evident that direct inquiries concerning tariff information addressed to the Bureau of Foreign and Domestic Commerce should be preferred by American exporters on account of promptness of service as well as accuracy of information.

The tariff work of the Bureau of Foreign and Domestic Commerce is not rigidly restricted to customs duties and customs regulations. The Division of Foreign Tariffs of the bureau gives attention also to closely allied subjects affecting our foreign commerce, such as the internal revenue laws of foreign countries, the regulations for commercial travelers soliciting business abroad, and the requirements of foreign countries for consular invoices, merchandise-marks, standards of purity, and the like. The United States diplomatic and consular officers report on these subjects, and translators and other assistants in the Bureau of Foreign and Domestic Commerce examine carefully the official publications of the foreign governments in order that all information regarding foreign tariffs and these allied subjects may be kept up-to-date.

The answering of specific inquiries concerning customs rates and regulations has come to be an important part of the tariff work

of the bureau. The information desired is so varied in character that special statements continually have to be compiled. To facilitate the compilation of such statements and to insure accuracy, inquiries should invariably be precise and detailed both as to the nature of the article and the particular countries in which the inquirer may be immediately interested. In foreign countries many articles are subject to customs duty merely on the basis of the component material, and the inquirer should always mention the component material as well as the nature and use of his products. When such detailed description is given, the bureau is the more readily enabled to indicate the foreign rates of duty.

The New Tariff Law

THERE IS EVERY PROSPECT that a new tariff law will very soon be enacted by Congress, which will eliminate entirely the duties imposed on a large number of necessities of life, and materially reduce the duties on many others. It goes without saying that the business of the country will have to readjust itself in some particulars to the situation presented by this possibly quite drastic legislation. Lumber practically will go on the free list, as the duty on all rough lumber other than cabinet woods will be removed, while the duty on the latter will be reduced from 12.75 per cent to 10 per cent; but with this advent will follow hundreds of items that go to make up the cost of living, and the general cost of lumber production.

It is thoroughly believable that the net results of this prospective legislation will be distinctly favorable to the lowering of the cost of production of all varieties of lumber in the United States, and will be especially advantageous to the hardwood end of the industry. The prevailing alleged protection to hardwoods under the Aldrich-Payne tariff law has been entirely mythical, as it is very hard to see any protection in a duty levied on woods that by no possible chance enter the United States in competition with local supplies. Therefore, in its eventual results the new tariff law will contribute materially to the lowering of the cost of hardwood production. It will doubtless lower food cost, clothing cost, machinery cost, steel rail cost and in fact everything that enters into the items of expense of lumber production, and as an eventuality, will doubtless lower labor cost. It is thoroughly believable that the hardwood industry can view with complacency the proposed tariff changes.

Imports and Exports for February

THE MONTHLY SUMMARY OF IMPORTS AND EXPORTS shows the total value of imports of wood and manufactures of wood for February, 1913, to be \$4,242,620, as against \$2,817,243 for February, 1912. Manufacturers of lumber, including boards, planks and other sawed lumber, aggregating in value \$845,883, were imported during February, 1913. This is an increase of \$340,000 during the year. The value of the mahogany import during the month of February was \$343,670, as against \$222,160 in February, 1912. The total value of pulp wood imported during that month in 1913 was \$409,986, as against \$280,890 in February, 1912. The total values of wood pulp imported during the same respective periods were \$1,623,362 and \$985,870.

The total export value of all wood and manufactures of wood during February, 1913, was \$9,647,449, as against \$6,700,417 for February, 1912. The total value of all manufactured lumber exported during this month in 1913 was \$5,084,514 and for February, 1912, it was \$3,421,417.

The Floods and Collections

APPALLING FLOOD DISASTERS have visited a large area of Ohio, Indiana and Illinois during the past fortnight, and beyond the consideration of the great loss of life and physical distress of thousands there is a commercial loss of such magnitude that it is yet not estimable. Perhaps the railroads have been the greatest commercial sufferers. Following closely is the loss to lumbermen and the hundreds of manufacturing institutions of which lumber is the basis of consumption.

The territory invaded has been the very center of manufacturing of articles from wood, and outside of the great losses sustained by this interest by direct damage, the loss is amplified by the interruption of business that has obtained. The affairs of hundreds of lumbermen and woodworking industries have been demoralized and it will take months for recovery. The situation undoubtedly will have a far reaching effect on lumber affairs, notably in hardwood. While perhaps few individual losses have been of such a monumental character as to bankrupt the concerns, it will be a long time before many of them will be able to promptly meet their current indebtedness, and hence it is probable that collections from this territory are going to be slow.

This delay in receipts from a territory consuming such a large quantity of hardwoods will reflect on the affairs of many manufacturers and wholesalers, as an interruption of collections from outstanding accounts will naturally upset the financial calculations of many.

Details of the flood disasters will be found elsewhere in this issue.

Liverpool Mahogany Sales

MARCH MAHOGANY SALES at Liverpool were well attended by representatives of large concerns. The catalogues of these sales were chiefly Lagos and Bonin, and while there was a considerable quantity of good wood which realized prices that were even higher than recent averages, there were also plenty of poorer grade logs, the prices of which seemed high in proportion to those realized on the higher class stock. One finely figured log was sold for almost \$12,500. It contained 3,802 feet and sold at 13s 3d. It is one of the largest amounts ever invested in a single piece of wood. It is reported that the outlook for arrivals at Liverpool are very disappointing, and as far as can be seen they will continue to be below normal for some months to come. There will necessarily be no appreciable reduction in price, at least for the next six months.

Continuance of Box Hearing

THE HEARING on the question of freight rate classification as applied to wooden vs. fiber containers, started at Los Angeles in January, in what is known as the Pridham case, is being continued at Chicago. The testimony at Los Angeles was more or less of a summary nature, but it is apparent from the attitude of both sides in the present hearing at Chicago that they will go very much more deeply into the controversy and get down to actual concrete facts pertaining to the advantages and disadvantages of both types of packages.

The Chicago hearing started at the Hotel La Salle in Chicago, April 4, and is not yet completed. So far the fiber box people only have submitted testimony. The wooden box interests have secured a continuance in the hearing to start April 21, at which time they will submit their side of the case.

The present indications are that the matter will work down to a definite basis with the analysis based on actual facts, in which event the wooden box people will surely realize a material advantage.

Forthcoming N. H. L. A. Meeting

PLANS ARE BEING COMPLETED for the annual meeting of the National Hardwood Lumber Association, which will be held at the Hotel Sherman, on Thursday and Friday, June 5 and 6. Plans are being made for the entertainment of even a larger number of visitors than were present at the Chicago meeting a year ago. Chicago's hospitality to the lumber trade is boundless, and it goes without saying that every provision will be made for expeditiously conducting the business of the organization, as well as for the comfort and pleasure of the thousand guests expected.

Quite an important part of the secret of success in the hardwood flooring business is to be found at the dry-kiln end, for without proper drying to start with, no hardwood flooring can be what it should be.

Pert, Pertinent and Impertinent

Smile and the world smiles with you;
 "Knock," and you go it alone;
 For the cheerful grin
 Will let you in
 Where the kicker is never known.

Growl, and the way looks dreary;
 Laugh, and the path is bright;
 For the welcome smile
 Brings sunshine, while
 A frown shuts out the light.

Hustle and Grin
 Sigh, and you "rake in" nothing,
 Work, and the prize is won;
 For the nerry man
 With backbone can
 By nothing be outdone.

Hustle and fortune awaits you;
 Sirk and defeat is sure;
 For there's no chance
 Of deliverance
 For the chap who can't endure.

Sing, and the world's harmonious,
 Grumble, and things go wrong,
 And all the time
 You are out of rhyme
 With the busy, bustling throng.

Kick, and there's trouble brewing;
 Whistle, and life is gay,
 And the world's in tune
 And the clouds all melt away.
 Like a day in June.

HELP!

Is engineering science helpless in the face of these constantly recurring and appalling calamities?

Equity

"After all, things are pretty evenly apportioned in this world."

"Eh-yah! A strong minded woman generally has a weak-minded husband."—*Smart Set*.

He Supplied It

Wallie—"How fast the horse is runnin'!"

Teacher—"You forgot the 'g.'"

Wallie—"Gee! How fast the horse is runnin'!"

—*Brooklyn Life*.

Not Qualified

Gibbs—How are lobsters caught?

Bibbs—Don't ask me, I'm no chorus girl.—*Boston Transcript*.

Matrimonial

Three Germans were sitting at luncheon recently and were overheard discussing the second marriage of a mutual friend, when one of them remarked:

"I'll tell you what. A man what marries de second time don't deserve to have lost his first wife."

Cheaper

Brown—"I wish I belonged to a golf club." Jones—"You don't need to. Just walk five miles or so, and every twenty or thirty yards hit the pavement a hard whack with your stick and swear."

Changed His Mind

"I thought you said, Grouch, that you would never permit your wife to run an auto?"

"So I did; but she happened to hear me say it."

As It May Happen

The kind-hearted old lady handed the beggar a dime.

"My man, how did you become so poor?" she asked. "What brought you to this terrible stage of poverty?"

"The parcel post, mam," replied the beggar. "You see, I used to be president of an express company."—*Cincinnati Enquirer*.

Profitable Lumber Advertising

FIRST PAPER

Editor's Note

This is the first of a series of six articles on "Profitable Lumber Advertising," which is written by a lumberman who has fully demonstrated his ability to secure substantial profits from lumber trade newspaper advertising, backed by an unusual ability in the preparation of forceful and convincing "copy." The next article will be on the subject of "Writing Copy," and will appear in next issue.

"Business failures continue large. Business men apparently find it impossible to raise their selling prices to make up for increased costs."—Wall Street Journal.

It sounds probable, very much so. Wages are higher, but traveling expenses are a great deal larger than ever before. Where is it all going to end? Either you must meet quotations or you must quit. It seems quite probable that business men are not down to the lowest basis of selling costs and to that reason and also to the fact that many men do not know how to figure these sales costs, many failures are directly attributed. It is safe to say that lumbermen in general are not using modern methods—in fact, it is said that the lumber business is the most backward of any profession—for the lumber business is a profession. It ought to be a science.

Just take the sawmill end of the game—the very basis of the business. Look at the enormous percentage of waste. Under the boiler it goes. When you suggest utilization of waste to the lumbermen, they throw up their hands and say they find no time to bother with it. And so the government has to put up experiment stations and employ experts to find out these things for them. One progressive manufacturer, for illustration, who was not satisfied to see the edgings and cut-offs from his mahogany go under the boiler, spent considerable time and research to see what he could make out of this so-called waste. Today he is making a wood mosaic flooring out of little pieces 1"x1"x½" end-grained, glueing them on a special mat and making a beautiful and everlasting floor. He gets fifty-five cents per square foot for this product. Just think of it—the profits from what used to be waste. It takes only a little thought to uncover some of the possibilities of waste utilization. The trouble with us all is that we are too content with things as they are. Anything out of the ordinary that comes up, we pass by and let someone else worry about. We all know that the waste is a big item of loss. Let us face the problem; get after it hot and think of new ways for turning the waste item into the profit column.

You can all laugh when the writer makes the statement that advertising is the newest method of selling goods at the lowest sales cost; but if you will just stop and think for a minute, you will realize that the steel people saw the opportunity and the concrete people saw the opportunity, and if you will look at the annual reports of the government issue, you will see a steady decrease in the annual consumption of lumber, and a steady increase in the use of both concrete and steel. Why, one cement manufacturer alone spends more in a year for advertising than the combined money spent by every lumberman in the business—every one in the United States—for their annual advertising. That is a very startling statement, but it nevertheless is a fact and can be verified.

One of our best known authorities on the subject of advertising, makes the following statement: "There are only two ways you can increase your business: You must either get new customers or get more business from the old customers. There are only two ways to get new customers. Either sell them what you already have to sell, or provide something else for them to buy. There are only two ways of getting more business from old customers—sell them more of what you are now selling them, or sell them something you are not now selling them.

"Advertising brings new business for what you already have to sell. It even causes you to improve your product or the varieties of your goods and so extend your business. It causes your old customers to buy again, to speak of your wares to others and to

buy other things from you. It forces you to consider how your proposition compares with that of your competitors and so lets in new ideas and policies, all aiming for a larger and more successful business. It makes you build up the efficiency of your selling force to take care of the new business and in turn, helps to develop the old business.

"At every point, then, advertising helps business. It seldom gets credit for all the influence it has in a business, but it is the real cause of a great deal of fundamental improvement in all branches of a business."

That little talk is a good thing to cut out and keep before you. It is one of the truest sayings that has ever been spoken. You have heard of advertising from the reports in the lumber papers and possibly from solicitors and in general they have all dealt with you in the matter of space only. The writer does not blame some of them for the attitude they take—for in past years, they probably have tried to get you to look upon advertising as a strictly business proposition. Advertising from the writer's experience, is even more—advertising is salesmanship in print. It's not a magic art of printer's ink and type, which, after the inserting of it in a small space, brings back success and profits to your door. Advertising is exactly the same as sending a salesman out to sell your goods, or tell the public about them. Look on it in this way. Suppose you make quartered oak. What is your logical trade—trim manufacturers, furniture manufacturers, retail yards and perhaps wholesalers. Pick out the paper or papers that reach these classes of trade. The paper represents your salesman; your advertisement represents the words of his talk. Now that you have that part of it straight, just for a minute think of the present day lumber advertisement. All salesmen in the latter case then (the advertisement) say, "My name is Smith; I sell hardwood lumber; office, Big Ditch, Ind." Mr. Lumberman, how long would you keep a salesman on a pay roll who approached your customers in this way? And yet it is just the effect that most present-day lumber advertisements have on a man reading the paper, and that is why you claim that advertising does not pay. It is true, and it never will pay. For the same reason that is why a great many men whom you put out on the road as salesmen fail to make good—they talk in the same way—they just go in a man's office and say, "My name is Smith, hardwood lumber, Indiana," and then expect to get business. Right here seems the proper place to say that it is absolutely impossible in these modern times to put a man out on the road who has not studied the selling game. As one very prominent sales manager says, "salesmanship is nine-tenths talk and one part the goods." And while that statement may seem rather radical to most lumbermen who have not studied modern methods, it is very true. There is such a thing as psychology, and it is applied in every day business by the scientific salesman as well as the advertising man—in fact, it is a necessity.

The writer does not mean to say that salesmanship is all talk, because knowledge of the goods is one of the prime factors; but it is an absolute impossibility to put out a man who has simply worked in your office or in your mill, and expect him to produce the results or to represent you in the way that he should. It simply cannot be done. The man probably knows nothing of tact or the way in which customers should be handled—it takes a man who has been trained in these features to cover the requirements of a scientific salesman. Advertising and salesmanship go hand in hand. Advertising puts your story before the people at the

lowest possible sales-cost. Just figure (if you think it possible to figure) what it would cost you to send a salesman out to visit five thousand prospective buyers and the time and expense consumed in such an undertaking—then think on the other hand that for simply a cost of from fifty to five hundred dollars you can tell your story to from three to twelve thousand readers (possible buyers) and all at one time, twenty-four times a year, without any other cost except for the space. How many of you have looked on advertising in that light?

To write an advertisement is not the stupendous task that one

would imagine—in fact one of the best advertisement writers in the country to-day states that all one needs to possess is the ability to tell a story about the goods in plain English and to strictly adhere to the truth about the goods; and that after you have told the story, stop. The writer has spent some years in the study of advertising—he has carried on two campaigns. He has also a few ideas on modern business methods. The idea in writing this series of articles on advertising is to give the layman the first principles of the science as particularly applied to the lumber business.

Theory and Practice of Discounts

There are a good many business customs which appear to have little logical excuse for existence; like Topsy, they just grew, and probably they will continue in operation until Gabriel's trump. One of these necessary evils is the use of the discount; it has to be granted, without rhyme or reason, and the best that the lumberman or other business man can do is to see that it doesn't wear out its small welcome by bringing in its train a host of petty abuses of one kind and another.

The theory of discount, of course, is that prompt payment is thereby encouraged, and the manufacturer or dealer is enabled to get possession of his money and employ it profitably the more speedily. On this basis, the most that ought logically to be paid for prompt settlement of bills is the banking rate of six per cent; in view of which the prevailing custom of granting the ancient and honorable two per cent, ten days, seems rather foolish.

In most businesses terms are thirty days net, in which the seller in effect pays two per cent for the use of his money for twenty days, certainly a large rate of interest; while in the lumber business, with sixty days net the usual basis of sale, the period covered by the discount, considering it as interest, is fifty days, making a more respectable, but still an inadequate showing. Discounts are too large, and in view of the various disadvantages to which they are subjected in use, it would be well if they could be done away with at one stroke. This seems to be out of the question, but it is probable that the lines could be drawn in so as to make the operation of the custom more favorable to the seller.

The excessive time allowed by the hardwood man to his customer in the settlement of net bills in sixty days is one of the things that should be taken up and could profitably be discussed by the trade. As indicated above, in most lines the limit is thirty days, and there is no reason why a longer period of grace should be granted in the lumber trade. The length of the period is disadvantageous also in that it encourages the purchaser, in case he has not taken advantage of the ten-day period in which to get his discount, to hold up the payment for nearly two months longer, seeing no reason why he should be deprived of the use of the money, if he is not to have an advantage of some kind or other.

With this in view some houses have adopted the plan of permitting a discount of one per cent on bills which are paid within thirty days after arrival. This rate, be it noted, is just double the legal rate of interest, again indicating the disparity between the value of money in the market and in the hands of the purchaser. It must be that the old phrase, "Let the buyer beware," had a companion piece in "Let the seller beware," and that the latter, fearing for the loss of his principal, was willing to grant a disproportionately large discount in order to insure payment. But, granting the risks of business, this idea certainly has no place in modern affairs.

A question which is sometimes debated is whether the discount period should date from the time of the arrival of the invoice or the arrival of the car at the buyer's station. There are a good many arguments in favor of the latter plan, inasmuch as it is hardly fair to expect a customer to discount a bill before he has had opportunity to examine the lumber. However, this is some-

times done subject to correction in case inspection does not tally with the invoice. But it is probable that in a great majority of cases the buyer is permitted to take the discount if he settles within ten days after the arrival of the car, if not after the inspection of the lumber.

A less mooted question is whether or not the buyer should have the privilege of discounting the gross bill when the seller has quoted a delivered price. As a rule, sales are made with the agreement that the discount shall apply to the net only, even though the receiver of the lumber has paid the freight and even though the price quoted applied to delivery. The point is truly made that freight charge itself is not subject to discount; and therefore that to discount a gross bill means to foree the seller to accept a definite loss on the part of the price represented by the freight. The argument on the other side is at least specious, in that the price at which the lumber was bought was the delivered price, and that the freight was paid as a convenience to the seller and to enable him to enjoy the use of his money. Few concerns attempt to squeeze out a discount of this small nature, however, though there are one or two hardwood buyers who put a clause to this effect in their orders and decline to purchase under other conditions. Doubtless, however, prices quoted to them are fixed at a point intended to take care of the loss through the application of excessive discount.

It is in the veneer and panel trade that most use is made of this theory, and more than one manufacturer admits that he is compelled to allow discounts on bills which include the cost of transportation. This being the case, it looks as if the thin lumber manufacturers ought to get together on the proposition and make a point of refusing to allow the discount, for it is not justified by general custom nor warranted in the premises.

The lack of uniformity in customs pertaining to discount is regrettable, in view of the fact that any concession in the discount amounts, of course, to reducing the price; though this is something that is not always understood as thoroughly as it should be. And it should also be remembered that prices are fixed on a basis of cost and expense without ordinarily taking into account the fact that the result is to be subject to discount. Thus net profits are nearly always less than had been figured on a basis of theory, because of the fact that the sawmill man, as has been pointed out in HARDWOOD RECORD before, is forced to grant discounts and is able to take none; inasmuch as log men are usually wise enough to sell their offerings f. o. b. their own station at a net price which does not permit the buyer to whittle the amount down through the use of a discount. And the log men are right, too.

The worst feature of all, though, is not in granting too much of a concession in the terms of discount, but in not adhering to them strictly after they are made. Collections are invariably poor with lumbermen, and real money looks pretty good to the man who himself has bills to meet and discounts to take advantage of; hence the buyer who is small enough to resort to petty practices is too often permitted to get away with it.

In fact, a large furniture manufacturer told with considerable

glee of a lumberman who had sold him two or three cars of quartered oak. There was some delay in inspection, and a check was sent out about twenty days after the arrival of the cars, carrying an amount which represented the net bill, less two per cent. A cold and polite note came back from the lumberman, who returned the check with the remark that the discount period had expired, and asked that the net amount be forwarded. The buyer, slightly nettled at what he considered too literal an interpretation of the rules, agreed to pay the net amount; but he also decided to wait the full sixty days before settling. The humorous feature of the story, from his standpoint, is that the lumberman wrote a pleading note a few weeks later asking him to send on the check as originally made out, stating that he needed the money pretty badly and would agree to relinquish the amount of the discount.

And there's too much truth in the condition for the story to sound very funny to the average lumberman. It's pretty hard to turn down the money, even though the other fellow has taken a mean advantage and charged off a discount when he wasn't entitled to it; but unless the seller adheres to the terms of the bill of sale he is going to be the victim of every business man who makes his cigar money out of his discounts and pays his dividends by hammering down material prices.

Lumbermen have learned one thing, however, and that is that buyers who don't intend to pay cash, and who have to have three or four months in which to pay for material, should not be allowed

to wait sixty days before giving a note. When it is known that the cash is not going to be forthcoming, a good rule to adhere to is to secure the acceptance immediately after the arrival of the car, thus getting a negotiable instrument at once. Inasmuch as the discount of the note can usually be accomplished without loss, this arrangement is actually better from the standpoint of the seller than that which permits the buyer to pay cash with the discount off in ten days.

In view of the general discussion among business men of the discount question, the following comment from one of the iron trade papers on the custom in the machine tool business is worth quoting:

"A large majority of machine tool builders have abandoned all cash discounts. They do practically all of their business with the dealers, and the latter claim that this additional concession would work to the advantage of all. The manufacturers, however, consider that their regular discount to the dealers is amply large to cover such a contingency as the requirements of customers of the dealers. One important machine tool manufacturer gave up cash discounts, but later adopted a compromise system of sixty days net and one per cent in thirty days. This, he believes, is working most advantageously." All of which goes to show that the discount is a problem to those in other lines as well as in the lumber business, and that it is a good idea to keep it in mind in discussing improvements with other members of the trade. G. D. C., Jr.

Connecticut Wood-Using Industries

The Connecticut Agricultural Experiment Station has published a bulletin dealing with the wood-using industries of that state. The statistics were collected and arranged by Albert H. Pierson of the United States Forest Service, in co-operation with the Connecticut Forest Department, under direction of S. N. Spring, state forester.

It is an exhaustive report and enters fully into the details of the manufacture of wood commodities in that state. The total quantity used last year was 110,000,000 feet, which is small compared with the amount of wood used by some other states; but utilization is highly specialized in Connecticut and the report is valuable for the details which it shows. Fifty-eight different woods are listed, white pine leading in quantity with one-fourth of the total amount. Chestnut follows, but it supplied less than one-third as much wood as white pine, while yellow poplar falls a little below chestnut. Thirty-two of the fifty-eight woods listed came wholly from outside of Connecticut, but the outside material was demanded in small lots, and of the whole supply used in the state, less than seventeen per cent was shipped in from outside regions.

That is an important showing for a state as old and as thickly settled as Connecticut. Compared, for instance, with Michigan it shows a much higher ratio of home-grown wood. Michigan imports thirty-eight per cent of the wood used by its factories. A considerable part of the forest in Connecticut is second growth, that is, it has come on since the original mature stands were cut. The average quantity of wood supplied yearly to factories by the forests in the state is nearly 20,000 feet per square mile.

The average cost of lumber bought by manufacturing plants was \$37.08 per 1,000 feet. That price is very high, in comparison with prices paid by similar manufacturers in most other states. It is higher than in Massachusetts, Maryland, Michigan or Illinois. The reason for the average high cost is that a rather large amount of very expensive foreign woods are used. Eight of them exceeded \$100 a thousand feet, and five of these averaged more than \$200. The most expensive was teak at \$287.50. The costliest American wood was black walnut at \$89.63, the cheapest hemlock at \$14.08. These prices are averages for the whole state. Some of the industries paid more, some less.

Twenty-six wood-using industries are listed in Connecticut. The largest quantity of material is used by box makers, the smallest by the manufacturers of butchers' blocks. The most important industries, in the order named, are: Boxes and crates, planing mill products; sash, doors, blinds and general millwork considered as one industry; musical instruments, ships and boats, clocks, vehicles, carpenters' tools, and woodenware. Some of the minor industries are the following: Laundry appliances, sporting and athletic goods, tanks, cigar boxes, printing materials, furniture, patterns, and firearms. The highest average prices for wood were paid as follows: The makers of carpenters' tools \$68.47, firearms \$67.11, patterns \$65.73, cigar boxes \$60.04. The lowest average prices were paid by boxes \$21.11, agricultural implements \$21.89, sporting and athletic goods \$22.68, and woodenware \$24.55.

The manufacture of boxes and crates is the leading industry in all the New England states for which statistics have been collected, that is, in Maine, New Hampshire, Massachusetts, and Connecticut. The reason for this is that extensive manufacturing is carried on in those states, and the product calls for shipping boxes. In all the states named the prevailing wood for boxes is white pine. Of the 24,411,000 feet of lumber used for boxes in Connecticut, nearly 17,000,000 feet were white pine—more than two-thirds of all. Three-fourths of it grew outside the state. The wood next in importance was spruce, followed by tupelo and black gum. The state supplied about one-fifth of the box material demanded by its manufacturers. About 3,500,000 feet came from south of the Potomac river. Twenty-one woods were listed for boxes, the hardwoods being sycamore, soft maple, red oak, hickory, hard maple, ash, rock or cork elm, white or soft elm, chestnut, basswood, yellow poplar or whitewood, black gum, and tupelo.

Many of the boxes in Connecticut are not the product of commercial box factories, but are made by manufacturers of various kinds of merchandise who make their own shipping boxes, but do not sell boxes to others. Hickory is an unusual wood for box making, and the quantity reported—25,000 feet—was probably used for dowels or other appliances for locking the corners of boxes or crates.

Planing mill products constitute the second largest wood-using industry in Connecticut. The principal commodities included are

interior and exterior finish for houses, including flooring and stair-work. Twenty-five woods are used, the leader being loblolly pine from the South, followed by cypress and shortleaf pine, also from the South. These three woods constitute nearly half of all demanded by this industry. White pine is fourth in quantity, followed by spruce. Fourteen of the species reported are hardwoods, of which yellow poplar is in most demand, followed in the order named by chestnut, white oak, red oak, ash, hard maple, red gum, sweet birch, cherry, tupelo, mahogany, black walnut, and beech. The walnut employed in this industry cost \$120 a thousand, the mahogany \$166. Less than five per cent of the wood was grown in the state.

Sash, doors and blinds constitute an important industry, and thirty-one woods are reported, white pine leading, followed by cypress, loblolly pine, and spruce. Eighteen of the thirty-one species are hardwoods, of which chestnut leads, followed by ash and yellow poplar. Thirteen thousand feet of hickory were used, chiefly as dowels. An equal quantity of black cherry was used.

Twenty of the twenty-five woods reported by manufacturers of musical instruments are hardwoods, constituting more than nine-tenths of all. Chestnut leads all others, and is followed by yellow poplar, basswood, and hard maple. The amounts of mahogany and cherry are comparatively large. Some very high-priced woods are listed by musical instrument makers in Connecticut, among them being black walnut \$198, mahogany \$243, ebony \$266, rosewood \$312, and Circassian walnut \$450. The average cost of all the woods reported in this industry is \$49.13.

Connecticut has long been famous for its clocks, and it is interesting to note the woods used and the amounts required. The following table gives these facts, and the average cost of each of the woods, per thousand feet:

Wood—	Feet used 1912	Average cost
Red oak	1,481,000	\$ 30.22
Basswood	1,400,000	32.64
Yellow poplar	1,050,000	35.32
Chestnut	285,000	19.02
White oak	262,300	47.35
Mahogany	104,000	146.83
Soft maple	80,000	28.00
Sweet birch	33,000	49.70
Red gum	27,000	32.91
White pine	20,000	37.50
Paper birch	10,000	30.00
Black walnut	9,000	83.33
Rosewood	290	340.69
Total	4,761,590	\$ 35.81

A tradition of long standing fails to prove true in Connecticut. Many people suppose that applewood is an important material in clock manufacture, but not a foot is listed in Connecticut. It is probable that applewood was formerly used when the wheels of clocks were made of wood, but few are so made now.

The woods listed in a handle factory in Connecticut are quite different from those in a factory in Kentucky or Indiana. Hickory leads in Connecticut, but is not much ahead of several others. Twenty-two woods are used, some being costly. These are made into handles for knives and fine tools. Among these are cocobolo, a Central American wood costing \$167 per thousand, mahogany \$180, ebony \$232, and rosewood \$285. Other woods not usually listed in handle factories are applewood \$30, butternut \$25, white pine \$17.45, dogwood \$24, cherry \$20.17, and paper birch \$19.91.

Much similarity is found in the table giving woods employed in the manufacture of carpenters' tools. Boxwood at \$48 leads in quantity. This is the West Indian boxwood, and not the article from Turkey which is much more expensive. Next to the highest in quantity is cherry, third is beech and rosewood is fourth. The foreign woods are cocobolo, lignum-vitæ, and mahogany. The average cost of all is \$68.47 per thousand feet, which is higher than the average cost of wood in any other industry in Connecticut.

It is generally supposed that dogwood is one of the most important woods in shuttle making, but dogwood is not mentioned in this industry in Connecticut, though eight woods are listed, and more than a million feet a year are used. Persimmon, another good shuttle wood, is used to the amount of only 120,000 feet.

The manufacturers of firearms in Connecticut reported the fol-

lowing woods and prices for 1912:

	Feet used	Cost per 1000 feet
Black walnut	389,700	\$ 78.14
Red gum	210,000	44.50
Circassian walnut	2,000	250.00
Boxwood	1,731	115.54
Total	603,431	\$ 67.11

Makers of patterns used 512,905 feet in 1912, at an average cost of \$65.73 per thousand feet. The following woods are listed in the order of quantity, beginning with the highest: White pine, spruce, yellow poplar, mahogany, chestnut, Idaho white pine, cherry, and butternut.

The making of furniture in Connecticut is a smaller industry than the making of patterns. Less than half a million feet were used in 1912, and, strange as it may seem, lignum-vitæ was employed in a larger amount than any other of the seventeen woods, and in nearly as large an amount as all other woods together. The lignum-vitæ is imported from Costa Rico, costing \$92 per thousand, and is manufactured into casters. It is evident that caster makers in Connecticut supply that article to furniture manufacturers in other states.

It is worthy of note that the leading cigar box material in Connecticut is rock or cork elm. This is not usually listed with woods used for cigar boxes. The amount was 93,500 feet, costing \$52.41. The other woods employed in Connecticut by cigar box makers are yellow poplar \$46.85, Spanish cedar \$115.59 (a very high price for this wood), tupelo \$54, red gum \$45.88, and basswood \$55.50.

Lumber Transfers Buggies

There are all sorts, kinds and conditions of wagons, lorries and buggies used to transfer lumber in and about a yard, but the equipment employed by the Lamb-Fish Lumber Company in its big plant at Charleston, Miss., looks about as economical and logical as any rig in existence.

The yard of this company covers an area of about forty acres and is planked throughout, while the lumber is loaded from the cars on an elevated platform. This company tried out several kinds of wooden-wheeled vehicles, but found that the wheels would not stand up in the Mississippi climate, and finally evolved the rig pictured in the accompanying engraving.

LUMBER TRANSFER BUGGY.

The wagon frame is mounted on cast iron wheels with five inch treads. The framework is bolted down to the square axles of the rear supporting sets of wheels, and is about seven feet long. The front wheels have a narrower tread than the rear ones, and are attached to the framework by a king bolt inserted through a broad circular pair of friction disks, one of which is fastened to the frame of the truck and the other to the wrought iron work of the front wheels.

A toggle binder chain is thrown around loads of narrow lumber for additional security, but ordinarily a load of from twelve to fifteen hundred feet is transferred without binders. The load is pulled by a mule.

This truck costs from seventeen to nineteen dollars and will stand up in any sort of weather conditions. It can be turned around in about as small a space as can a wheelbarrow. It is extremely handy and is giving the Lamb-Fish Lumber Company entire satisfaction as a vehicle for the transportation of lumber from the yard to cars.

Second Growth Defined

The term "second growth" when applied to wood is frequently used without a definite idea of its meaning, and it doesn't mean the same to all people who employ the term. The usual idea is that second growth timber has come on since the primeval forests were cut, or that it is timber which occupies old fields or tracts laid bare by fire or some other cause.

The chief consideration is that second growth timber must be comparatively young, and in many instances it is regarded as an advantage if it has grown on ground somewhat open. That, however, depends upon what kind of timber it is, and for what purpose it is intended.

A large part of the loblolly pine in the South is second growth, in the sense that it occupies old fields or other areas which were vacant at a comparatively recent period; but it is of no advantage to this pine to grow in open stands. If it does so, it is less valuable, because it is wanted in the form of long, shapely logs, free from limbs and knots. That kind is produced only in thick stands. Consequently, no one ever advertises loblolly pine, or any other pine, as second growth. Such an advertisement would not help to sell the lumber. In fact, the older a pine is, provided it has not been injured by decay, the better the lumber is.

Hickory is exactly the reverse. That is the wood most frequently advertised as second growth. When it stands in open ground, or where surrounding trees do not crowd it, the increase in size is rapid, and the trunk contains little heartwood, sometimes none, until the bole attains considerable size. Very tough wood is wanted. A short trunk with plenty of white sap, and with fibers tough and interlaced, is preferred to a long hole, which grows slowly in the shade of the forest and becomes brashy rather than tough. In that sense, to apply the term second growth to hickory really means something. No better hickory is procurable than that which grows in old fields, and in open spaces in the forest. The trunks are short, but the wood is excellent. A rather large amount of hickory of that kind goes to market, for it is a wood of rapid growth where it occupies open spaces and is nourished by good, deep soil. That is why some of the old states like Ohio and Indiana continue to send much good hickory to market, though the old forest supply was pretty closely cut years ago.

Second growth is an advantage to ash and elm, and in fact to

nearly all woods in which toughness and strength are highly desirable; but it holds in all cases that trees which develop in open ground and increase in size rapidly, have short trunks and large crowns. It is the large crown, with plenty of leaves, which can develop only in open ground, that causes the trunk to increase rapidly in size. The growth of wood is in direct proportion to the quantity and health of the foliage. A starved, compressed crown, in a thick forest, cannot feed the trunk sufficiently to induce rapid growth.

Elm and ash are found in open ground occasionally, but genuine second growth is less abundant with them than with hickory. They are sawed into lumber oftener than hickory, and toughness and abundance of sapwood are not so frequently insisted upon.

No one ever advertises second growth walnut, yet, in proportion to the total quantity of growing trees, it is doubtful if any wild tree of this country is more frequently found fulfilling typical second growth conditions than black walnut. It is an old-field and wayside tree, and springs up plentifully and grows rapidly. No one wants second growth walnut, because walnut is purchased for the color and size of its heartwood. Young trees, growing rapidly in the open, develop heartwood so slowly that a trunk eighteen inches through may not have more than six or eight inches of colored heart, often less than that. The old, forest-grown walnut possesses the desired properties, though it is neither tough nor very strong.

Oak is like both hickory and walnut, that is, some users want young, tough, second growth, others will take only mature trees, from which most of the elasticity and toughness of youth has departed. It depends upon the use intended. The wagon maker would rather have the young tree, and he cares nothing about the color and figure of the heartwood; in fact, the less of it, the better. The furniture maker has no use for young oak of second growth, but wants veteran trees, with old, rich heart, abundance of figure, and plenty of grain. Beauty rather than excessive strength is the chief consideration.

Taking the country generally, there will be more second growth timber in the future than there has been in the past, because the primeval forests are being cut, and growth more or less open, and timber of less age will largely meet demand in the years to come.

More Hardwoods in the Home

It was, of course, a man who said, "Inconsistency, thy name is woman!"

Here's an instance to prove the point.

A clothing dealer in one of the leading cities of the Ohio valley was carefully explaining why a reduction in the tariff on wool or woolen goods would not affect the cost of clothing appreciably.

"The material doesn't cost much compared with the price paid by the ultimate consumer," he pointed out. "It must be remembered that the goods in fabric form move through two or three hands before reaching the factory or tailor; then the cutting up and manufacturing process puts an additional impost of expense upon them; and the greatest load of all is added in distribution to the trade and sale over the counters of the retailer, because the latter has to maintain expensive quarters in the heart of the city, install the most expensive and convenient fixtures and deliver the goods ten miles by motor truck, if necessary, in order to get the trade. I venture to say that changing the value of woolen goods by means of a tariff reduction will not affect the price of a suit of clothing to the extent of thirty cents, on an average."

This was an impressive demonstration; but it would have been

more conclusive, as well as more consistent, if the same idea had been followed out by the clothier; for he was at that time letting a contract to a builder for the erection of a home which was to cost five or six thousand dollars, in which all of the interior finish above the first floor was to be of pine and other softwoods, while even downstairs hardwoods had a chance chiefly at the floors, most of the doors being of inferior material.

The reason oak was not being more generally used was because of the "expense," the clothier having inquired of his architect which would be the cheaper. When he learned that cypress cost less than poplar and pine less than oak, he ordered the designer to substitute the less expensive woods.

But he nevertheless believes that the cost of material is a minor factor and that manufacturing and labor expense forms the chief load—in the clothing business.

It is equally true of the lumber field, but consumers appear not to realize it. And this creates a splendid opportunity for the hardwood trade to do a little intelligent boosting. The average owner doesn't realize how much it would add to his home, in beauty, durability and value, to have oak and other hardwood trimmings and floors instead of softwoods chosen because of their

cheapness and little else. Of course some of the manufacturers of these woods have exploited their product intelligently enough to create something of a consumers' demand, which has been responsible for a positive statement by the owner in favor of a wood which is obviously inferior to oak. But, generally speaking, it is the apparent difference in cost which affects the situation most.

A well-known builder, who operates a planing-mill for the manufacture of the millwork and interior finish used in his own jobs, as well as for the trade, said the other day that in the typical dwelling costing from \$5,000 to \$7,500 the difference in cost between pine and oak would not amount to more than \$150, or roughly 2½ per cent; while the value of the house built with hardwoods for interior finish is always greater than the difference in cost indicated. Obviously, then, such a policy is not only a good one from the standpoint of investment values, but in the long run is a real economy.

This builder is himself an enthusiast on the subject of oak, for he said:

"I can't understand the apparent failure on the part of the public to demand oak and other high-class hardwoods for interior finish work. My hands are tied, largely, because the owners and architects say what they want and I must give it to them. But with pine costing \$35 and oak \$65 delivered, and the manufacturing expense not more than ten or fifteen per cent greater on oak than the other wood, the opportunity to show much of an increase in cost because of the use of the better wood is not very large.

"And think of the difference in the results! Nothing wears like oak, and in a house where there are children, who are kicking up the woodwork and putting it to the severest tests, oak seems rather to improve than otherwise; while any other wood rapidly depreciates and loses its appearance, carrying down the value of the house immediately and inevitably.

"A smart home-builder who is in the business of designing and selling moderate-priced homes in a large middlewestern city said recently that he had long ago realized that it is the woodwork that does more than anything else to sell his properties.

"I have found that it pays to spend a little more time and expense on framing up a pleasing interior, using hardwood floors and hardwood interiors generally wherever I can afford it, than to put the same money into other things. Oak finish means to a house what sterling does to silver, and I take advantage of it whenever I can."

This chap builds bungalows which are rather hastily thrown together, and relies more on their "cuteness" and conveniences of arrangement than actual quality to sell them; yet, even so, the builder realizes the immense advantage won by putting in a little money on his interior finish.

Did you ever notice the ads of those who have houses to sell? If they have any hardwoods in their buildings, they not only mention it but feature it! Hardwood floors have long been recognized as indicating a high-grade proposition, and the public needs only to be educated as to the corresponding desirability of other hardwood items.

Take doors for instance. Here pine is specified in a great many cases when the logic of the situation demands oak. And stairways, balustrades, molding, baseboards, window sash, door-frames and other classes of interior finish, even in houses that are desirable in many respects, are too often of baser woods, the owner apparently being overcome by the idea that the use of hardwood interior finish throughout would increase the cost immensely.

The hardwood flooring people have the battle half-won, but even they should press their advantage more closely. Instead of being content with hardwood floors appearing only in a few rooms on the lower floor, as is frequently the case, why not point out the immense advantage and the slight increased cost of putting them all over the house? The public is ripe for arguments of this sort, and if the initial advantage already held were followed up, it would unquestionably show in the increased consumption of hardwood flooring, even though this commodity, as indicated, is leading other forms of hardwoods by a long way in interior construction.

The architects offer probably the most fertile field for general work on the subject at present. That they haven't the courage of their convictions was indicated by remarks made by a young designer recently in discussing the fads and foibles of owners.

"In a great many cases," he said, "I specify oak and other hardwoods in interior work, but when the estimates come in from contractors it frequently happens that the owner finds that the castle he had built in his imagination is going to cost more in reality than he had intended. He wants to know if the cost can't be cut down somewhere; and that means I have to begin to pare. I attack the heating and plumbing installations, the lighting fixtures, the hardware and the interior finish, because all other items are practically fixed, unless the design of the house be substantially altered; so that by dint of cutting off a hundred here, fifty dollars there and a couple of hundred over there, through a considerable list of items, we manage to get the price down to what the man who pays the bills thinks it ought to be. So it's frequently a case of necessity on my part."

Stated that way, the situation does not seem encouraging; but inasmuch as the average owner wants a first-class house, especially if it is to be his home, he would be willing to stretch his appropriation a little in order to cover what seem to be essentials; but the point is that hardwood trimming has not been considered in that light, but merely as an optional feature, to be included if possible, and left out if convenient.

Consequently the problem that presents itself to the trade is to impress the facts upon the architect, the owner and the public at large that hardwoods are not expensive; that they do not increase the cost of home-building materially; that they do increase the value of a house by considerably more than the added cost; that the beauty and durability of the home so trimmed are greater, by far, than is the case in that which is finished with inferior materials. When these points are hammered in hard enough and long enough, there won't be any question about it; the public will not only be willing to take oak and other hardwoods if the architect suggests it, but will actually demand them.

The Filer and the Sawyer

There are two men of primary importance in the operation of a sawmill, men on whom quite a share of the success of the operations depends. These two men are the saw filer and the sawyer. Usually the importance of the saw filer is duly recognized and he is the best paid man on the place, but the other man, the sawyer, who sometimes does not receive as much recognition or pay, is often more important in a way than the filer. The reason for this is that it is easy enough to recognize when a filer is doing his duty, whereas it is difficult at times to know whether or not the sawyer is doing his duty; consequently when you have a sawyer who you know is good and is doing all that he should do, he is really worth as much to the mill owner as is the filer.

If the filer fails in his duty the result is apparent almost immediately in the form of broken or poorly running saws. In other words, there is immediate and direct evidence of how the filer is doing his duty, so it is comparatively easy to keep check on him and either keep him keyed up to his work or get another man. With the sawyer it is a different matter. You can tell whether or not he is wasting timber in unnecessarily large slabs, but it is quite a complicated task, requiring the presence of an expert all the time, to tell whether or not the sawyer is getting all the money value that he should out of logs. There is really more brain work about properly sawing up logs, if one stays by the job faithfully, than there is about properly filing or tensioning a saw. The sawyer who uses his brains, uses them well and continuously; may save the millman many times more money, as compared to an indifferent sawyer, in the course of a day than the wages of the sawyer and filer combined. For this reason the sawyer is really entitled to more consideration than he usually gets, and if he is really a good man and uses his brains all the time, he is the man who should pull down the biggest wages in the sawmill. Some time this fact will be recognized.

Three Unusual Trees

HAMMATTI

The hammatti tree is indigenous to the Pacific slope of the southern part of Central America, where it forms the most conspicuous forest tree. It is botanically called *Cavanillesia platani-folia*, and is one of the most majestic trees known. It has an exceedingly limited distribution as compared with a good many of its closely allied species. The ceiba (*Eriodendron anfractuosum*), for instance, which closely resembles the hammatti, is well known, being a native of all tropical countries, and is frequently planted for shade and ornament. The hammatti, on the contrary, is a little known tree outside of its immediate region of distribution, and is not regarded as a desirable tree for planting for shade. This is due to the fact that the trunk is usually without branches for more than half the total height of the tree and does not cast a dense shade around its base. It grows from sixty to eighty feet in height and has a trunk often six feet in diameter four feet from the ground. Like some of its near relatives, the trunk of the hammatti tree frequently bulges out immediately above the ground, which renders it a very conspicuous object. Above this great bulge the trunk tapers very little until it reaches the first branches. The wood is white, coarse-grained, very soft, weak, and exceedingly light in weight. It is so light that one man can easily carry on his back a log eight feet long and three feet in diameter. This huge tree possesses no value as timber, because it decays in a short time after it is cut. The wood is also of very little importance as fuel.

BRAZIL-NUT TREE

Brazil-nut tree, or *Bertholletia excelsa*, is one of the most widely distributed trees in Brazil, Guianas and Venezuela, and furnishes the well-known Brazil nuts or cream nuts of commerce. The tree attains a height of from one hundred to one hundred and fifty feet and a diameter of from three to five feet. It is one of the most gigantic trees in the South American forests and forms immense stretches of forests along the banks of the Amazon and Rio Negro, and likewise about Esmeraldas on the Orinoco, where the natives call it "juvia." The Portuguese name in Brazil is castanheiro or castanheiro do Para, and is so called because the Castanheiro Indians usually gather the nuts and bring them to the market in Para, where they form a considerable article of export.

In 1910 nearly 500,000 bushels of these nuts, valued at \$1,250,000, were imported into the United States.

The fruit of this tree is nearly round and contains from eighteen to twenty-four seeds, which are so beautifully packed in the shell that when once removed it is impossible to replace them. When the fruits are ripe they fall to the ground and the Indians, who gather them, split them open with an ax and gather the seed for shipment. These seeds are much used in commerce. The oil expressed from the nuts forms a substitute for olive oil, and is employed by watchmakers and artists.

The Brazil-nut tree is closely related to the Colombian mahogany (*Cariniana pyriformis*) and the woods resemble each other in general appearance. The wood of this tree is coarser, however, and is not likely to be substituted for either the true or Colombian mahogany. It is highly esteemed in Brazil for building and naval construction and for works exposed to the soil and air. It is hard, heavy, strong and tough, and splits with a straight, clean fracture, though not so easily as our hard maple. The wood is light brown, but turns slightly darker with age, and takes a very fair polish, which it retains. It is found in such great abundance and possesses so many of the qualities necessary to make posts, poles, piles and exposed timbers of all kinds that it may be expected to be found in the American markets in the near future. Its durability combined with cheapness recommends it as a substitute for our flooring woods, and it will make an absolutely clean floor that will last. Our beech, birch and maple make fine floors, but the cost is generally so high that these seem prohibitive except in high-class work. There is an almost inexhaustible supply of this wood and the large forests have scarcely been touched with the ax.

Every part of the tree is useful. The bark is employed for making oakum, which is used extensively in Brazil for calking vessels.

ARAUCARIAN PINE

The araucarian or Chilean pine (*Araucaria imbricata*) is a magnificent evergreen tree of the cone-bearing family of plants, and is reputed to be hardy in this country as far north as the latitude of New York. It will stand the climate without any difficulty anywhere south of the Mason and Dixon line, where it will thrive

HAMMATTI, THE MOST REMARKABLE TREE IN PANAMA.

BRAZIL-NUT TREES SHOWING THEIR LONG CLEAR TRUNKS.

AN ARAUCARIAN PINE PLANTED FOR ORNAMENT.

and grow for centuries, as it is known to do in its native country. It is unquestionably the most interesting tree of this great group of evergreen trees. The general characters of its shoots, even when the tree is young, are singularly bold and picturesque, and quite different from that of every other tree of this tribe. The leaves are usually eight together, ovate, lance-shaped, thickened at the base, stiff, straight, with persistent sharp points at the tips. The cones are globular at the ends of the branches and about the size of a man's head. The scales are beautifully imbricated.

In its native country this tree attains a height of from eighty to one hundred feet, with a trunk like a pillar. The crown is shaped

like a depressed cone, the side branches proceeding from the trunk in a horizontal direction, and ascending slightly at the tips. Over those branches, which are arranged in whorls, the leaves are thickly set, like scales, which give an appearance of richly-embossed work. From the thick coating of leaves, which pervades the whole outline of the tree, an idea of brittleness is conveyed to the mind. The wood, however, was successfully used in shipbuilding in 1780, for which it is peculiarly suited. The tree is also particularly ornamental, and no plant can be used with greater effect in distinguishing particular spots of country appropriated to art. It should be on every lawn. It is both elegant and unique. L. L. D.

More Efficient Wood Utilization

Editor's Note

The following is a report of the speech delivered by O. T. Swan of the United States Forest Service, before the annual meeting of the North Carolina Pine Association, Norfolk, Va., March 20.

Rising stumpage values, increasing costs of production, and a market at times liable to oversupply and always subject to competition from other materials, have turned the attention of lumber manufacturers during the recent years to the possibilities of securing increased profits from stumpage through better utilization. It is in fact the competition of wood substitutes which is forcing the attention of lumbermen to this question since through closer utilization on a large scale it is hoped to secure a more profitable and a more stable industry notwithstanding other limits of the lumber market. The vulnerable points of the lumber industry and the possible extent of substitution may be more clearly seen by noting the quantity of lumber used for different purposes and determining in which uses wood has a natural monopoly. Estimates made by the Office of Wood Utilization subsequent to statistical studies of the amount of wood consumed by all the wood-using factories in twenty states indicate that about thirty per cent of the entire lumber cut goes into planing mill products, where competing materials are weakest. About twenty-six per cent goes into rough lumber and structural timbers, where it meets steel, brick, and concrete. About ten per cent goes into boxes and crating where fiber and veneer are having their peculiar effects on the industry. About five per cent goes into car construction and is to no small extent being driven out by steel. Over three per cent goes into furniture and two per cent into vehicles where the peculiar and valuable qualities of wood offer strong resistance to any encroachment of other materials. Two per cent of the cut is used for sawed ties and there is now no substitute for the wooden tie. Over five per cent is exported. This quantity will probably increase greatly since the United States is one of the few great timber-producing countries. The remainder of the lumber produced, or about fifteen per cent, goes into a great many miscellaneous uses.* In all of these leading avenues of wood consumption which I have mentioned, with the exception of that of crossties and export stock, wood is subject to the competition of other materials, and advancing cost of wood for these purposes will tend strongly to bring about the increased use of the competing products.

In those articles for which wood possesses valuable qualities, which present substitutes lack, or in those articles in which the cost of the wood used is a relatively small per cent of the cost of the finished product, wood can meet competition. But in those classes of products in which the cost of the wood used is a high per cent of the cost of the finished article, and for which more or less suitable substitutes are available, wood is liable to gradual commercial displacement as its cost to the consumer increases or as the cost of substitutes decreases. Further, there is a distinct

trend toward a cheaper production of substitutes and toward more permanent construction.

From this it appears that it may be difficult to continue indefinitely to market annually the present average total product of the lumber mills if economic conditions force a continual rise in price of lumber for some of these major uses. Certain species and certain grades of lumber can compete with substitutes, even at considerably higher values than at present. It is the output of the mills as a whole—the disposition of large quantities of certain woods—which presents a difficult situation. Decreased output will not balance this possible condition since the higher grades will probably be required in present or greater quantities. On the other hand, the natural increase of the country in population, the development of new uses for wood and the growth of the world demand for timber reflected in the export trade are counterbalancing factors of great weight. Nevertheless, the outlook demands that waste products of this industry be made to produce revenue and that present conversion methods be improved.

Wood, in its course from the tree to the finished article, is subject to greater losses than any other important raw material, since much less than one-half of the tree reaches the final user of the wood. The bulk of this loss of raw material has been necessary to the processes of conversion, to the cost limits in handling or transportation, to the practical requirements of commercial grading, or to the lack of definitely proven profitable systems of close utilization having general applicability. No one of these limiting factors is fixed and it is worth while to have in mind what utilization changes can follow changes in these limits. Conversion processes have steadily improved, new machines reduce handling costs, transportation charges are not unchanging, commercial grades often fail to meet specifications for new uses properly, while there is a constant advance in the knowledge of processes by which further products can be made from wood in its waste forms.

QUANTITIES AND FORMS OF WASTE

In order to find out just how much waste material is available the Office of Wood Utilization secured reports from a large number of the most prominent sawmills in the state of Wisconsin, showing the quantities and forms of waste in that state. Reports from 136 mills, cutting \$60,000,000 feet, show that they have available annually 576,000 cords of sawmill waste, and 1,373,000 cords of wood waste, making a total of 1,949,000 cords. Thirty-five per cent of the total is sawmill waste, the remainder being woods waste. This material will cost, on an average, \$2.12 per cord f. o. b. car at the mill, with an additional cost of 30 cents per cord for sorting the species for separate shipment. The woods waste may be purchased at an average price of \$3 f. o. b. car at the mill. About one-third of the mill waste is now sold or used as fuel. Conditions, as reported in Wisconsin, are duplicated in the other lumber producing states to a greater or less extent.

*When the final figures for all states are available it is believed that the modification, if any, of these estimates will be in the direction of a larger per cent of lumber in construction.

While the percentage of waste varies greatly in different parts of the country and in different operations, it appears that in producing forty billion feet of lumber in the United States the following quantities of material, expressed in terms of cubic feet of the original tree, have not reached best use at the mills:

900	million cubic feet of wood in sawdust
550	" " " " " " " slabs
550	" " " " " " " edgings and trimmings
230	" " " " " " " careless manufacture and accidents
133	" " " " " " " standard lengths and widths
1,000	" " " " " " " bark

Taking the loss in stumps, tops, broken and defective trees, and trees left for other reasons, in the ratio to production as reported in Wisconsin, 5,700 million cubic feet of such material is left in the woods annually. The total quantity of all material amounts by these estimates to approximately 9 billion cubic feet, or the equivalent of 100 million cords. Of this about one-third is sawmill waste.

The species furnishing the greatest quantities of material and the most material at a single point are, of course, yellow pine in the South, Douglas fir and redwood in the West, and white pine and hemlock in the North. Yellow pine furnishes over a third of these totals.

CONVERSION OF THE LOG AND WASTE MATERIAL IN FURTHER MANUFACTURE

This phase of the subject in fact must include present efficiency in the manufacture of lumber, the present disposition of the lower grades, and the unusual use of waste material.

Waste wood can now be used to a limited extent either by further manufacture, resulting in the production of certain classes of short lumber and small wooden articles, or as the raw material in industries in which it loses its identity as wood through mechanical distintegration or chemical processes. In the latter case such articles as wood pulp, alcohol, etc., are produced. Small mills, for reasons which will be shown later, are chiefly limited to the first method in the utilization of their waste, while the problems of the large operations apparently must be met by both, but largely by the chemical industries.

While much has been accomplished, there are many reasons operating to prevent the general use of wood waste in manufacture of wooden articles or products other than lumber. First, there may not be enough waste annually at a given point to warrant the installation of the special machinery required; second, the waste may be of innumerable sizes, shapes and species, and the cost of sorting thereby made prohibitive; third, location of supply and markets may be such that freight charges would absorb the profits; fourth, the fuel value of the material may be greater than the profits from further manufacture; fifth, the market for the product may be very limited; sixth, the necessary machinery may be ill adapted to handling the form of waste or not open to general use on account of patents. It is, therefore, a distinct problem in each locality and for each mill.

On the other hand, if the amount of waste is relatively large, the sizes and shapes few in number, the market for the product not too distant or overstocked, it often happens that wood waste can be profitably made into other articles. The opportunities for unusual applications of this method are greatest in connection with the more valuable hardwoods, and least often, feasible in the case of cheap coniferous woods. There are a number of localities where the waste of hardwood mills can be converted into squares and other small dimension stock for the use of nearby furniture factories, novelty mills and other wood industries. The present difficulties lie in the disposal of assorted lengths instead of a few sizes, the assembling of sufficient quantities of this material subject to regular shipment to several industries, incompetent manufacture of the stock, and loss in handling due to checking, stain, etc. Some central agency in such localities would often solve the difficulties mentioned above. As practical millmen, you know now about how far it is profitable to manufacture lath, box lumber, moldings, pickets, etc., from material which might not otherwise be used.

Short hardwood parquetry flooring stock is common in Europe, while here it is common to see hardwood flooring cut into 12-inch lengths by carpenters laying flooring in patterns in apartment houses. In France short pine pieces are used for pine parquetry flooring, which is often laid direct on the joists in the herring bone pattern, the joints being thus supported by the joists. This utilizes short flooring less than two feet long of uniform size. No market exists at present for this stock in this country, but it offers a suggestion. This example is representative of many similar ones and illustrates the opportunity and the difficulties.

The manufacture of paving blocks is one of the growing uses of wood in this country which deserves your attention. The equivalent of 10,000,000 cubic feet of lumber was used for paving in 1911. Strong coniferous woods which take a heavy creosote oil treatment readily will probably prove most acceptable for this use. In Europe the heavy, dense hardwoods, up to this time, have not given results equal to treated conifers. The complete list of American woods which will give satisfactory service as paving has not been determined and test pavements should be laid to test them. The installation of a wood preserving plant permits the treatment of paving blocks, crossties sawn from the poorest part of the log, poles and piling. Such a plant permits greater flexibility in the utilization of the timber in the woods and the products of the mill since the durability of timber can be brought up to commercial requirements of wood preserving processes. The growth of these processes and the amounts of material treated in the United States in the past ten years has been remarkable.

In favorable situations it is desirable that other industries be conducted in conjunction with lumbering for closer utilization. For instance, there are cases where cooorage manufacture, pole and tie production and lumbering are conducted on the same operation profitably. Trees and other material which would be left in the woods by the lumberman can be utilized by the cooorage manufacturer. The manufacture of such stock, however, from mill waste or slabs will not likely prove profitable, except in the case of heading under certain conditions.

The box industry, which aids greatly in utilizing the tree, is injured by that competition within and outside the industry which forces down the quality of the package by a lack of standards. The loss to shippers and railroads through improper packing is enormous. In my judgment, one of the best steps which could be taken would be to work out standard strength and other requirements for all the leading classes of shipping containers, through co-operation between the manufacturers of all such containers, the shippers and the railroads. Such tests should be reduced to a scientific basis. The standards could be made obligatory or shipment refused. The best form in which material can be used in order to manufacture the strongest container for a given purpose at a cost limit needs to be determined.

The veneer industry is growing very fast and making good use of the material handled, largely gum. In some cases even the cores are being sold to paper mills for manufacture into pulp, used as mine rollers or cut into erating for vegetables. More gum mine rollers are used in Pennsylvania than any other wood. Formerly maple was preferred. The growing tendency to market fruit and vegetables in fancy packages is increasing the market for cheap veneer, while the use of built-up lumber is increasing rapidly.

The lumber associations can assist utilization in important ways. In transportation, differential rates for low-grade lumber and low rates for mill waste would help considerably. It is their work to increase the use of odd lengths and short lengths and to see that specifications of important consuming industries are adapted to the material which can best be furnished. The Forest Service is doing considerable work along this line.

The article then reviewed the possibilities of close utilization through turpentine extraction from waste and through the manufacture of wood pulp.

In the destructive distillation process the wood is heated in a retort until it is broken down chemically, vaporizing a number of compounds which are later recovered. Turpentine, charcoal and tar

are the principal products obtained from coniferous woods, while wood alcohol, acetates and charcoal are derived from the hardwoods. About one hundred plants are now operating in New York, Pennsylvania and the Lake States, on birch, beech and maple, which are received usually in the form of cordwood. About thirty plants are operating on softwoods in the southern states, mainly in Florida, Alabama and Georgia, on material which is largely woods waste, although some mill waste is included.

The production of ethyl alcohol from sawdust has claimed considerable attention during recent years. Probably many kinds of wood can be used by this process, the limitations as to species, however, not being well known at present. The forms of waste which can be employed are unlimited since the material must be very finely divided before treatment. The sawdust is treated with sulphuric acid under suitable conditions, resulting in the formation of sugar, which is then fermented to produce alcohol. Several commercial plants, some in this country, have been erected to produce alcohol from wood in this manner. There are certain difficulties related to the maintenance of the equipment under the strong acid used and securing efficient chemical conversions which require further investigation. The firm establishment and growth of this industry is a development much to be desired since it will assist in solving two problems: the utilization of sawdust and the production of another fuel for motors, one of the growing problems of the motor car industry, following increasing cost of the present fuel. Cheap ethyl alcohol is assured of a satisfactory market, while sawdust exists in greater quantities than any other form of mill waste.

The development of power by the use of wood waste in special gas producer plants operating gas engines is capable of almost unlimited development, since, as the process becomes efficient, the power produced can readily be transmitted considerable distances by electrical engineering methods. Plants are in operation in France and one or two in this country.

Bark in large quantities is used only in the production of tannin extracts, only hemlock, chestnut oak and tanbark oak containing sufficient tannin to warrant extraction under present methods. Possibly the production of fiber board will utilize the bark of other trees eventually.

The leaves of trees have seldom been utilized. In Australia and even in California the leaves and twigs of some of the eucalypts are distilled by very simple and inexpensive apparatus, with the recovery of some very valuable and marketable oils. The essential oils in the leaves of American trees have been very little investigated, yet there is little doubt that some of these products would prove of value. The leaves of longleaf pine have been exploited for a number of specific purposes at different times, such as the production of paper pulps and textile fiber substitutes, but without lasting results, I believe.

Chemical methods of waste utilization, which generally involve an expensive plant, experts in the industry, a continuous and large supply of material, are not of a character which can be adopted by small mills acting as separate units. Acting in groups the transportation of material presents increasing difficulties. These methods are most applicable to large plants, operating on certain woods, with available timber for fifteen years or more. Considerable capital is required and the employment of experts is, of course, essential. This development, therefore, will probably be slow and perhaps more likely to come about through the activities of the experts in these other industries in their search for raw material than otherwise.

The ideal utilization plant would consist of a number of industries assembled under one organization, and in sufficient variety so that the timber in question could be converted into precisely those products for which each part of it is best suited and which would bring the best return, under the market conditions prevailing at any time.

It is conceivable that a plant of this kind in a favored situation in the longleaf pine belt may eventually turpentine the standing timber, recover turpentine from parts of the mill waste and the

light-wood of the forests use part of this and other waste in the production of paper, manufacture lumber from the best parts of the tree, and convert the remaining parts into varied manufactured products according to the market. A wood-preserving plant as a part of this equipment should lead to the profitable marketing of ties, poles, piling, and paving blocks.

Summarizing, it is clearly apparent that the lumber industry needs profitable methods of waste utilization, and there are a number of methods which have actually been applied to a limited extent, some of which are being employed to a greater extent each year; that a number of methods while offering much of promise hold many problems requiring solution before they can be considered as meeting present conditions. Private capital is doing much along several lines in the actual testing out of methods.

The branch of products of the Forest Service is conducting investigations to find methods to prevent waste, to utilize waste, and to increase the service of timber. This work, which includes many studies of interest to lumbermen, is conducted by the Forest Products Laboratory at Madison, Wis., and along different lines but in a less comprehensive way by the Office of Wood Utilization in Washington. The Office of Wood Utilization is now completing a statistical investigation of the wood-using industries of the United States. The results of this work should be of considerable interest to the lumber trade, since there will be available (1) the first authentic statement of the amount of each kind of lumber used by each industry, and (2) the principal uses made of each species in all parts of the country. It will thus become possible to trace lumber into its various channels of use and to measure the competition of different kinds of wood for certain purposes in each state. It is planned to make this information available for use in two series of publications; one concerning each of the important woods, which will show clearly where it grows, where it is milled, where and by what industries it is consumed and its exact use in all parts of the country. The other series of publications will give similar information from the standpoint of each of the different industries, discussing the woods which are of particular value to each of them. Reports of this character are now available for nearly every important wood-consuming state.

Information concerning the classes of raw material required by the wood-working industries is being assembled in order that suggestions looking to the use by one industry of the waste of another may be brought out. Data showing the classes, quantities, and forms of waste in each of the different industries is being compiled. One of the greatest obstacles to the use of waste material in the industries through further manufacture lies in the absence of machines which will economically handle wood in the peculiar form in which it occurs as waste material. Few machines, no matter how small the articles manufactured, have been designed with the idea of using waste wood. It is the intention to assemble data showing what opportunities exist for machines of this character and after a close study of the present available machinery to place the information before machine manufacturers in order that they may design new equipment to meet this new point of view.

Inquiries are being received in increasing numbers from manufacturers who wish to use or dispose of various kinds of raw material. This shows plainly that much more attention is being given to this matter in recent years than ever before. Tests are being arranged in co-operation with the manufacturers of wooden articles in order that the value of certain untried woods may be proved out under new uses commercially, thus establishing a better market for the wood and opening up new sources of raw material for manufacture. The Office of Wood Utilization is also engaged in an endeavor to assist in a more complete use of the large quantities of chestnut timber which are being killed by the bark disease. This disease is steadily advancing into the unaffected chestnut region and it is by no means certain that it will not eventually cover the entire chestnut belt. Since the trees remain merchantable only a few years after their death from this disease, the problem of securing the prompt marketing of the material is pressing in the states north of Virginia, and a great deal of

detailed information concerning the channels of use into which the wood may be directed is being disseminated. Actual tests are also being made to show the lack of foundation for certain prejudices which exist against the blight-killed timber in some sections. Similar studies have been made where large areas of timber have been killed by fires in the West.

Large quantities of low-grade lumber are used in the form of both outside and inside scaffolding in the construction of buildings or interior decoration. Recently several forms of patented scaffolding have been placed on the market, some of which offer so many advantages, including greatly reduced cost over present forms of lumber scaffolding, that their growing use is certain. These patented forms are used repeatedly. The Forest Service has under way an investigation from which it is planned to estimate the amount of lumber used in scaffolding and to study the different patented substitutes. Lumbermen themselves can offer one substitute which can be used more cheaply than the present forms. I refer to the poles scaffolding used almost exclusively in European countries. Instead of dimension timbers fastened by nails for this temporary work, long, light poles are readily put up and fastened by various simple devices other than nails or spikes. This pole framework carries the same plank floors used with the present dimension timber scaffolding. The material is used repeatedly and if generally introduced would furnish a brisk market for long, light poles with a butt diameter not exceeding from four to seven

inches. European building contractors carry a large stock of these poles.

The Forest Products Laboratory has a large corps of experts and is working upon the very problems which the preceding discussion has shown to be vital to a rapidly increasing utilization of waste by chemical industries. New woods are being tried out under the different processes such as in the production of paper pulp for wood distillation, alcohol, etc. Timber strength tests to show the comparative value of every commercial wood in the United States are being made.

An expensive equipment was installed last summer to investigate fully the production of alcohol from sawdust by the most improved processes. An improved type of dry kiln has been invented and tried out with most satisfactory results, and exact data on the relative durability of different woods and the value of different preserving chemicals is being determined by actual tests of the material in railway track, pole lines, wharves, etc.

A French process for the cheap preservation of poles has been successfully introduced into the national forests and will be tried out in the South. It is believed that loblolly pine poles can be made decay resistant ten or twelve years at small expense by this process.

The Forest Service hopes that lumbermen will follow these investigations closely, aid with their advice, and take full advantage of the results.

Forest Products of Canada

The Department of the Interior of Canada, through its forestry branch, has published bulletins 34 and 35, the former giving statistics of the output of lumber, lath, and shingles, for 1911, and the latter the production of crossties and poles for the same period. The reports were compiled by R. H. Campbell, director of forestry.

The figures for lumber are taken from the reports of 2,871 firms operating sawmills in Canada. That was an increase of 108 firms over 1910, the increase occurring in every province except Alberta and Quebec. It was greatest in Nova Scotia. The total value of lumber, lath and shingles produced in 1911 was \$82,321,664, the items being, lumber \$75,830,954, square timber \$766,406, shingles \$3,512,078, and lath \$2,212,226.

The lumber cut was largest in Ontario, second in British Columbia, and decreased in the other provinces in the order named: Quebec, New Brunswick, Nova Scotia, Saskatchewan, Manitoba, Alberta, Prince Edward Island. The total in Canada was 4,918,202,000 feet, which was an increase of 466,550,000 feet over 1910. The average mill in 1911 cut 1,713,000 feet, against 1,611,000 feet for 1910. The mill price of lumber, averaged for all kinds and in all provinces, was thirty-nine cents per thousand less than in 1910. The following table gives the average value at the mill of the twenty-six kinds of wood lumbered in Canada. They are named in the order of their rank in production beginning with the highest:

Spruce	\$13.65
White pine	20.01
Douglas fir	13.94
Hemlock	12.65
Cedar	14.86
Red or Norway pine.....	17.68
Birch (chiefly yellow birch)	17.04
Tamarack	13.95
Western yellow pine.....	15.22
Balsam fir	12.16
Maple	19.33
Basswood	19.69
Jack pine	13.80
Elm	19.26
Ash	18.74
Cottonwood and Aspen	15.24
Beech	14.47
Oak	28.57

Chestnut	22.73
Hickory	29.48
Walnut	20.45
Butternut	21.22
Cherry	28.63
Yellow poplar	19.43
Sycamore	20.26
Sassafras	12.00

There was a decrease from 1910 to 1911 of almost fifty per cent in the cut of beech, basswood, and balsam fir. Eight other woods showed a decrease, while hickory, walnut, and cherry increased. There was considerable decline in the average price of white pine and Douglas fir, but an increase in quantity for both of these. White pine decreased in mill price 40 cents and Douglas fir, \$1.51. A somewhat remarkable falling off in mill prices occurred with three common hardwoods, hickory, walnut and yellow poplar. The first was \$10.31 cheaper in 1911 than in 1910; the second, \$18.81 cheaper; the third, \$10.57 cheaper.

The annual cut of spruce in Canada is less than 200,000,000 feet below the cut in the United States, and Canada's output of balsam fir is 74,580,000 feet greater than that of the United States.

The cut of softwoods exceeds the hardwood output fifteen fold. In the United States the hardwood output is one-fifth that of softwood. The hardwood which is cut in largest quantity in Canada is birch, principally yellow birch, followed in the order named by maple, basswood, elm, ash, aspen and cottonwood, yellow poplar, beech, oak and chestnut. The output of oak lumber in Canada is less than 8,000,000 feet. This is not two per cent of the cut of oak in Tennessee or in West Virginia. Any one of twenty-seven states in this country exceeds the cut of oak in the whole of Canada. The annual production of ash in the United States is seven times that of Canada. Hickory and black walnut are almost extinct in that country. A little yellow poplar is sawed on the north shore of Lake Erie, and some cherry is found in Ontario and Quebec, but the whole Canadian output of cherry is only one-eighteenth that of the United States. All the sassafras reported was cut by a single mill north of Lake Erie.

During the year 1911, Canada exported the equivalent of about 14,000,000 feet, board measure, of square timber, chiefly birch, white pine, and elm. The trade in square logs has been declining

in Canada for thirty-five years on account of the increasing scarcity of clear timber of large enough dimensions for squaring. White pine of this kind has been decreasing since 1868, but has always headed the list of Canadian export square timber until 1911 when birch went above it in quantity but not in value. Oak is third on the list and elm fourth. About two per cent of the square timber exported from Canada entered the United States.

The output of shingles decreased more than 100,000,000 from 1910 to 1911. The cut in the latter year was 1,838,474,000. The principal falling off occurred in British Columbia and Quebec. The most expensive shingles were made in Saskatchewan, \$2.85 per thousand, and the cheapest in Prince Edward Island, \$1.25. The cut of shingles in the United States for 1910 was six and a half times greater than Canada's. Ninety-five per cent of Canadian shingles are of cedar, chiefly the western red cedar and the northern white cedar or arbor-vitæ.

The output of lath was 965,235,000 for the year, at an average mill value of \$2.29 per thousand. Spruce lath constituted the largest quantity, followed by white pine, cedar, Douglas fir, hem-

lock, and a dozen other woods. The United States produces about four times as many lath annually as Canada. Beech makes the most expensive lath in Canada at \$7.50; the cheapest is Douglas fir at \$1.83.

In 1911 Canada produced 13,683,770 crossties. The greatest number were of jack pine, followed in quantity by tamarack, Douglas fir, hemlock, spruce, cedar, oak, and a dozen others. Ten million ties were used in improving old tracks, and most of the others went into western lines. A rather large number listed as jack pine were lodgepole pine cut in the region of the Rocky Mountains.

It is estimated in Canada that eighty-seven per cent of crossties are destroyed by decay, twelve and one-half per cent by mechanical wear, and one-half per cent by insects. About 10,000,000 ties are annually destroyed.

The number of poles purchased, was 585,703. That was nearly 200,000 less than were purchased in 1910. Their principal uses were in electric power lines, for steam and electric roads, and for telegraph and telephone lines. Ninety per cent of the poles were cedar. The second wood in quantity was western larch.

Big Holdings of a Scarce Wood

Nearly a year ago when C. L. Willey, the leading veneer and fancy wood man of Chicago, made a single contract for the delivery of two earloads of black walnut veneers weekly for a long period, wisacres in the trade shook their heads. It was felt that Mr. Willey had assumed a pretty large contract, in view of the fact that black walnut was one of the scarcest woods in the United States.

The present total output of black walnut in this country is less than forty million feet annually, of which about one-half is exported in log form, largely to Germany.

Mr. Willey has not only made his deliveries during the last eight

months of two cars of veneers weekly on this order, but has taken care of a considerable quantity of miscellaneous black walnut veneer trade as well. At the present time he has in his log yards at Robey street and Blue Island avenue approximately 1,250,000 feet of as good black walnut logs as has been seen in years. These logs are piled on four rollways, and are pictured on this page. The rollway shown in the upper left hand picture is about eight hundred feet in length, and the illustration in the upper right hand shows another aggregation of logs nearly as long. The other two pictures show smaller dumps.

Besides this quantity of black walnut, Mr. Willey owns upwards

FOUR ROLLWAYS CONTAINING ONE AND A QUARTER MILLION FEET OF BLACK WALNUT LOGS AT PLANT OF C. L. WILLEY, CHICAGO

of four-hundred additional carloads, which are in process of shipment to the Chicago plant. These logs have been picked up by his buyers in small quantities in Illinois, Arkansas, Missouri, Iowa, Oklahoma and Kansas. This is probably the largest assemblage of black walnut logs that has been seen for the past ten years,

and doubtless will never be duplicated in the history of black walnut veneer and lumber production. On the present basis of production, Mr. Willey is manufacturing into veneer and lumber ten per cent of the annual output of American walnut logs, exclusive of those which are shipped abroad for foreign consumption.

The Flood Situation

The effect of the unprecedented flood throughout the Middle West will be felt particularly by the lumber business. Its effect has already been seen in some sections in the matter of stock flooded and washed away and of tying up transportation so that delivery has been very nearly impossible. It is impractical to attempt to give a graphic description of flood conditions without being actually on the ground. Hence HARDWOOD RECORD has arranged to secure reports from various important sections showing what has already been done to the lumber business by the floods, and also telling the possible future effects which will be felt. These reports are shown in connection with this article.

At Cairo, the Ohio river rose to its highest stage and strenuous efforts were made to prevent any breaking or overflow of the levees. Every able-bodied man within reach was drafted into service by the troopers in charge, and they worked like demons piling up sandbags and dumping rock ballast in order to build the levees as high and substantially as possible. At the time of this writing it is believed that the danger mark has been passed, and that nothing need be anticipated, although the high water mark passed any previous records and the resulting pressure on the levees was terrific. Still as a result of the efforts to strengthen them they were equal to the task.

A large amount of lumber was shipped out of Cairo and Mound City immediately before the floods, and for this reason and because of the adequacy of the levees to perform their duty in most cases, the loss to the lumber trade was nowhere near what had been anticipated.

At Louisville, Ky., as at other points, the highest water since 1884 was experienced. The usual ill effects were felt by the lumber trade, which was completely tied up, both because of suspension of transportation, and because of stock being submerged. At this writing, the railroad companies are resuming normal operations.

At Evansville, Ind., the lumber trade experienced considerable loss due directly to the floods. The height reached was the greatest ever recorded at Evansville, and because of the fact that most of the mills are on high land or well away from the river, the principal damage was done to woodworking factories and yards rather than to the mills. However, considerable quantities of logs and lumber were swept away, and the aggregate damage was considerable. Evansville was practically cut off as far as railroad transportation was concerned for several days. Railroads operating out of Evansville have, however, up to this time gotten back to pretty nearly a normal condition.

From the mountainous regions in eastern Tennessee and western North Carolina come reports that the damage in those sections was very considerable. Enormous rainfall resulted in devastation, which washed out bridges and railroad tracks and caused considerable damage to buildings, and held up logging and sawmill operations. Of course, in this section the actual damage to lumber is nothing. The chief loss resulted from the suspension of operations and the washing away of structures of various kinds.

A report from Memphis dated April 6 says:

"The crest of the rise in the Mississippi river is rapidly approaching Memphis and will arrive the latter part of this week. S. C. Emery, local forecaster, still insists that the river will go to a stage of between 45 and 46 feet as against the highest previous stage reached in April last year, 45.3. The reading of the gauge this morning showed a stage of 43.7, or within 1.6 feet of the maximum for this city. The river is now rising, but it is said

that the rise, which has been at the rate of about 1½ feet per day for the past few days, will be less rapid during the next few days. The height to which the river will go will be determined in large measure by the resistance shown by the levees. A higher stage would have been recorded last year at Memphis but for the numerous breaks which occurred in the levee system at points in Tennessee and Arkansas, which allowed the waters to spread over a much larger area.

"There have been no breaks so far in the levees in either state. The situation was described as very threatening a couple of days ago at Reelfoot Lake, west Tennessee, where one of the bad breaks occurred last year, but the crest is already at that point and the embankment is still holding, with prospects of continuing to do so. At Wilson, Modoc, Wyanoke and other points in Arkansas where breaks were experienced in 1912, there is a considerable margin, even with a stage of 46 feet at Memphis, and there is a note of optimism in the reports given out by the levee authorities regarding their holding. Major Markham of the United States Army, with headquarters at Memphis, officials of the St. Francis Levee Board and Major Dabney, who has charge of important levees south of Memphis, say that conditions are quite favorable. They emphasize the important part played in the fight by the excellent weather which has prevailed since it became known that the river would go so high. Conditions this year have been in striking contrast with last year in this respect. Then it rained almost every day, making it almost impossible to strengthen the levees and at the same time preventing the embankments, owing to their soggy condition, from having anything like normal resisting power. There has been only one rain in this section during the past few days. Much will depend upon the weather during the next few days, but levee men seem to be of the opinion that the fight has already been won and that there will be no serious crevasses.

"The present high water has already put a number of lumber manufacturing plants in Memphis out of commission and they will have to remain closed down for some days. In North Memphis Moore & McFerren, the Memphis Stave Manufacturing Company, the Tennessee Hoop Company and the Anchor mills have already had to suspend, and in New South Memphis the following are out of commission for the time being: Columbia Package Company, Gillette Brothers, May Brothers, Memphis Band Mill Company and the McLean Hardwood Lumber Company. Private protecting levees were built in New South Memphis, but they were not able to withstand the strain, and lumber interests are suffering to the extent indicated. Other plants will likely be affected before the high water is a thing of the past. May Brothers and others, when they saw that they would be unable to protect their yards, moved their lumber to high ground and thus saved themselves the trouble of having to market a great deal of overflowed stock, as was the case last year. There are some other plants here that will possibly be affected by the decrease in log receipts, but that will depend largely upon how the railroads get through the flood. Last year they suffered heavily and it was impossible even for the mills not affected by the high water to bring in their timber, with the result that the hardwood lumber industry suffered almost complete paralysis for a time. At this writing the Illinois Central, Yazoo & Mississippi Valley, the Rock Island System, the Frisco System and other roads entering Memphis from the West are still intact and are handling lumber, logs and other traffic though on

somewhat delayed schedules. Arrangements have been made to establish boat service between Memphis and Madison and between Memphis and Helena in the event the western lines are put out of commission so that there may not be a complete tying up of westbound traffic as was the case last year.

"The extent to which outside lumber interests will be interfered with will depend almost if not altogether upon the manner in which the levees hold. Large lumber manufacturing firms at Wilson, Proctor, Marked Tree and other points in Arkansas last year had their plants badly damaged and suffered heavy loss through the overflow of their lumber. This was the direct result of the breaking of the St. Francis levee at so many points, notably Golden Lake, near Wilson, Madoe, Wyanoke and other points which filled the St. Francis basin with flood waters. If the levees hold this year those interests which were so badly damaged last year will doubtless escape with only minor loss. Thus, from the standpoint of outside lumber interests, the outlook is regarded as decidedly more favorable than last year.

"The levee at Beulah, Miss., where a serious crevasse occurred last year and where the flood waters of the earlier rise in the Mississippi this year did considerable damage to lumber and other interests, has been repaired to such an extent that it is believed by levee interests that it will hold. The Illinois Central took the matter in hand a short time ago, built a railroad to the break and poured thousands of tons of crushed stone into the crevasse, followed by an equally large amount of dirt. Work is still in progress and there are yet a number of days before the crest of the rise will go so far south as Beulah. In the meantime every possible effort is being put forth to further prepare the new embankment for the protecting service it is to perform."

No considerable damage resulted from the recent floods and storms at Nashville, although there was more or less timber destroyed at different points and the high waters interfered with the operation of mills on river banks and with hauling over rural roads. The amount of rebuilding which will necessarily result from the storm damage will naturally benefit the lumber trade, both wholesale and retail.

At Cincinnati the many manufacturing plants along the Mill-creek valley were either destroyed or so badly damaged as to put them completely out of business for weeks, and business was completely paralyzed. Lumber interests at all these points have been heavy sufferers. Most of the stock in the valley has been swept away and millions of feet of all kinds of building material will be needed for reconstruction work when rebuilding commences. The railroads have also been hit hard, most of their bridges over the many streams having been washed away, and all of the available timber in this city has been bought up by them for the construction of temporary bridges just as soon as the Ohio river recedes so far as to make the work possible. The highest stage of the river was 69 feet 8 inches—just lacking 2 feet 1 inch of equaling the highest water ever known here, in 1884, when it was 71 feet 9 inches. The water was almost up to Third street, the entire west end being completely under water, as was also the east end of the city, while many of the smaller towns across the river in Kentucky were completely submerged, only house tops or chimneys showing where Dayton, Ky., used to be.

The lumber interests at Cincinnati, with few exceptions, were out of business, the big west end yards being probably the worst off. At many of these yards lumbermen, knowing that a high stage of water was inevitable, constructed booms around the yards and thus saved their property, none of which was lost so far as can be learned at this time, although many of the lumber piles floated and upset. Some of the yards were pretty well tangled up and will require more or less reconstruction. There is not likely to be much loss of property to lumbermen on account of the extraordinary precautions taken.

HARDWOOD RECORD's correspondent at Columbus, O., says that the unprecedented flood which swept Ohio during the latter part of March had the effect of paralyzing the hardwood trade in central Ohio. Mail was cut off entirely for almost a week and orders

consequently were infrequent. Railroads were out of commission for some time, and it will require weeks for them to resume their usual state of affairs. Cars loaded with lumber were swept away and lost, and the market in every way was demoralized.

Lumbermen were powerless to help themselves under the circumstances. Business has not yet become normal, although one of the effects of the flood was a good demand for many items in the hardwood trade. Railroads especially, which suffered the loss of many bridges and trestles, purchased all of the timber that they could secure. It is estimated that the loss to the lumber and allied trades in Columbus is well over \$50,000.

The floods did not touch Toledo heavily. There was some raising of the water above normal, of course, and some of the lumber yards situated along the banks of the Maumee river and of Swan creek suffered some losses, although by no means heavy ones. There were some instances of valuable lumber being corralled by grappling hooks, but for the most part the lumber was in good shape and practically all the loss will be occasioned by the necessity for repiling.

Outside of Toledo, at Defiance, Napoleon, Tiffin, Fremont, Piqua, Dayton and other cities, the damage was greater and some large lumber firms have suffered severely, almost the entire stock being lost in a number of instances. Even when the lumber was not carried off the losses on hardwood lumber was great owing to the deterioration of quality caused by the sediment and sand which ground into the timber and made cutting extremely difficult, the sediment dulling the knives.

The tying up of railroad systems has been the most disconcerting thing with the Toledo concerns, as shipments have been refused by the greater share of the railroads here until within the past few days, when conditions have again resumed a normal attitude.

Thousands of dollars' worth of damage was done to hardwood lumber throughout the district, but something can be saved by repiling. The ultimate result of the losses will be an advantage to the lumber trade generally, as thousands of homes throughout the flooded districts will have to be repaired and rebuilt, and this in addition to the building due to the natural growth.

"The Oldest Living Thing"

The story of the great Mexican cypress tree at Santa Maria del Tule is again going the rounds, under the caption, "The Oldest Living Thing in the World." It is said to have a trunk over forty feet in diameter, and estimates place its age at from 5,000 to 6,000 years. Nobody knows how old it is, as there is no history of its youth. The annual rings have never been counted. The tree has been known by white people a couple hundred years, and that is as far back as there is definite information. It has been proposed to bore into the trunk and take out a plug extending from the bark inward a couple of feet, and by counting the rings, estimate the rest, and thus ascertain how old the tree is.

Nothing reliable can be found out that way. It is well known that rate of growth for a large tree has seldom been uniform throughout its whole life. A young trunk nearly always grows much faster than an old one. It is equally impracticable to determine the age of one tree by comparing its size with another whose age is known. That is what some propose doing with the big tree in Mexico; in fact, it has been done already, and argument has been made that since one cypress four feet in diameter was 670 years old, the one in Mexico, which is forty feet through, must be ten times as old. Experience has shown that no such ratio exists.

Coming back again to the big Mexican cypress, it may not be as old as its size indicates. The appearance of the tree itself is the strongest evidence of that, for some who have seen it say it consists of a clump of cypresses, once separate trees, but by enlarging they have grown together, and now form a ribbed and fluted mass which is one trunk but once consisted of several. If that is the case, it is evident that the tree as it stands is no older than the original trees which grew together in the process of forming it. The estimated age, therefore, of 5,000 or 6,000 years should be divided by five or six, at least.

The Mail Bag

Any reader of HARDWOOD RECORD desiring to communicate with any of the inquirers listed in this section can have the addresses on written request to the Mail Bag Department, HARDWOOD RECORD, 537 South Dearborn Street, Chicago, and referring to the number at the head of each letter and enclosing a self-addressed stamped envelope.

B 421—Has Florida Cedar to Market

Ebensburg, Pa., Apr. 3.—Editor HARDWOOD RECORD: I wish to secure a market for Florida aromatic red cedar, estimate 3,000 cubic feet. I can deliver at Jacksonville, Fla., and can load for export, if desired.

Any reader wishing to be placed in touch with the above correspondent, can have the address by referring to B 421.—EDITOR.

B 422—Not Affected by Floods

Indianapolis, Ind., Mar. 28.—Editor HARDWOOD RECORD: The reports that have gone out from this city in regard to the situation caused by the recent floods in this district may have caused some of our customers and friends to think that we would not be able to fill their orders promptly, but we are pleased to state that, fortunately, our plant was not affected by the high waters, and as we have our own water supply and lighting system we have been able to run right along without any interruption. Traffic is now fast resuming its normal condition and all orders and inquiries will have prompt attention.

E. C. ATKINS & CO., INC.,
N. A. Gladding, Vice-President.

B 423—Seeks Sawed or Sliced Gum Veneers

Cincinnati, O., Apr. 1.—Editor HARDWOOD RECORD: You recently sent us a list of the annual requirements of users of veneers in this country. However, we would still be more interested in having a list of the makers of veneers, particularly of any people who make sawed or sliced gum veneers, as we do not want rotary cut stock.

The writer of the above letter has been referred to several producers of sawed and sliced gum veneers. Any others interested in the inquiry can have the address on application.—EDITOR.

B 424—Wants Works on Flooring

Detroit, Mich., Mar. 25.—Editor HARDWOOD RECORD: I am thinking of going into the business of laying hardwood floors in private residences. I would like to get a book which treats of plain and fancy flooring, giving an estimate of time to do the various kinds of work. If you publish anything along this line, or know of anyone who does, I will be pleased to hear from you.

The writer of the above letter has been referred to various publications and sources of information to secure the facts he seeks.—EDITOR.

B 425—Wants 3/8-Inch Square Oak Strips

Eastwood, N. Y., Mar. 27.—Editor HARDWOOD RECORD: We would greatly appreciate it if you will give us the names of various concerns who would be in a position to quote prices on 3/8-inch square oak strips, random lengths, dressed four sides to exact size, from clear stock. We want from 10,000 to 50,000 running feet.

The writer of the above letter has been supplied with a list of concerns that would likely be interested in this inquiry. Any others can have the address on application to "B 425."—EDITOR.

B 426—Wants to Market Osage Orange Logs

Goodland, Ind., Apr. 3.—Editor HARDWOOD RECORD: Charles C. Deam of the State Board of Forestry of Indiana, advises me to write you for information concerning Osage orange logs, which wood is used in finishing work of Pullman cars. I have a part of a carload of logs running from 8 to 18 feet in length, and from 12 to 18 inches in diameter.

The writer of the above letter has been advised that we were not aware that the Pullman Company ever employed any Osage orange in the finishing of its cars. He is further advised that Osage orange has but little general demand save in the form of fence posts, but two addresses have been given him, in which it is deemed possible he may be able to market the wood for inlay purposes.—EDITOR.

B 427—Use of Sassafras

Texarkana, Tex., Apr. 6.—Editor HARDWOOD RECORD: Can you give us an idea as to the class of trade that consumes sassafras? Also would like an idea as to the prices for which it sells.

—LUMBER COMPANY.

The writer of the above letter has been advised that sassafras is marketed in the form of fence posts, staves for buckets, 2x4 fence rails, 4x6 arbor posts, railway ties, and often in the form of lumber for the production of coffins and moth-proof chests. There is no established price for this wood, but it ranges along pretty closely with poplar values.—EDITOR.

News Miscellany

Meetings of Memphis Club

John A. Fox, secretary-manager of the Mississippi River Levee Association, successor to the Interstate Levee Association, delivered an address before the meeting of the Lumbermen's Club of Memphis at the Hotel Gayoso, Saturday, Mar. 29, in which he asserted that this organization had been launched for the specific purpose of securing from the United States government an appropriation sufficiently large to build and maintain a system of levees adequate for the complete protection of the property and lives of the people of the Mississippi valley. He said that he and those who are associated with him, including some of the most prominent professional and business men in the United States, had come to the conclusion that it was impossible to handle this gigantic problem without the aid of the United States government and that he proposed to go forward with the work of education of public sentiment to such an extent that it would demand this work at the hands of the Federal authorities. He stated that the best engineering thought of the country agreed that the building of the levees and re-vestment work was the only means of solving this problem and that the separate levee boards could not cope with it. He also declared that it would require a considerable sum of money, about \$50,000 per year, to defray the expenses of the educational campaign which is to be waged during the next three or four years. He thought Memphis ought to contribute at least \$10,000 a year because this city and section would be a direct beneficiary of the work planned. He further expressed the view that the lumbermen of this city and territory should pay at least \$2,000 of this amount.

At the conclusion of his address the club authorized the appointment of a committee to canvass the lumbermen for subscriptions. This work will have to be done by the individual lumbermen rather than through the Lumbermen's Club.

K. D. McKellar, Congressman from the tenth Tennessee district, was also present and told the Lumbermen's Club of Memphis that he would be very glad indeed to draw up a bill authorizing the division of the United States into shipping zones so that hearings before the Interstate Commerce Commission might be facilitated. This was in answer to the request made recently by the club for the introduction of such a bill into Congress. He also said that he was hopeful that it would be possible at the forthcoming session to bring the steamship companies within the jurisdiction of the Interstate Commerce Commission. He said he regarded the commission as one of the most important arms of the government service and that its jurisdiction over the steamship companies in the matter of rates would be of very great assistance to exporters of lumber as well as other commodities.

Mr. McKellar heartily endorsed the address of Mr. Fox and declared that he would be very glad indeed to lend every possible assistance to the plans looking to federal handling of the levee problem. He asserted that he was confident that it could be successfully handled only through the financial resources of the United States government and that the question of states' rights, which had been raised by some interests, could be disposed of without difficulty. He said that it was necessary to have someone on the spot who was responsible for the work to be done and that he did not believe the Mississippi would be properly restrained until someone was placed in charge of the work and gave it his undivided attention.

J. M. Card of the J. M. Card Lumber Company, Chattanooga, was also present. He has been in Memphis for the past few days attending the meeting of the rules committee of the National Hardwood Lumber Association. He said that some changes had been made but that these had been comparatively few. He also said that the committee was counting upon the support of the Memphis delegation to the annual of the association.

S. B. Anderson of the Anderson-Tully Company, was named as the delegate from the Lumbermen's Club of Memphis to the hearing at Chicago in the case of the Pridham Box Company vs. the Southern Pacific Railroad. This involves the question of uniform rates on goods shipped in both wooden and straw board packages. At present goods shipped in the straw board cases take a lower rate than those shipped in wooden containers. This is a matter which is of very great interest to Memphis

because this is one of the leading points for the manufacture of shooks and other material used in the manufacture of wooden packages.

The Interstate Commerce Commission has asked for a conference with the lumber organizations in reference to estimated weights on hardwood lumber shipments and uniformity of standards of weighing. The club turned this matter over to the river and rail committee with authority to send a delegate to Washington if it considered this the proper course to take. The conference is scheduled for April 14.

Resolutions were adopted in connection with the recent death of Donald P. Mann.

The Lumbermen's Club of Memphis, at a special meeting held at the Business Men's Club Thursday evening, April 3, rescinded its action at the regular meeting Saturday, March 29, endorsing House Bill No. 524 providing for an extra premium of three per cent on and the payment of \$1 for recording all policies on insurance issued by companies not authorized to do business in Tennessee. There appeared to be considerable disagreement over the endorsement of this bill and it was because of this fact that the subject was brought up at a special meeting. It is given out that the rescinding of its former action does not mean that the club will actively oppose the passage of the measure; but the club is desirous of continuing the fight for lower insurance rates and did not wish its attitude with respect to this bill to prejudice its interests in any way.

The subject was referred back to the law and insurance committee of the club, of which James E. Stark is chairman, and this committee will continue its recent vigorous campaign for lower insurance rates in this city as present rates are regarded as quite excessive and badly out of line with those at points north of the Ohio river.

Coming Meetings

The board of governors of the National Lumber Manufacturers' Association decided at its last meeting that the annual meeting of that association is to be held at Kausas City, Mo., on Tuesday and Wednesday, June 3 and 4. The headquarters will be at the Hotel Baltimore.

President Hamar of the Northern Hemlock and Hardwood Manufacturers' Association announces that the regular quarterly meeting of that association will be held at the Hotel Pfister, Milwaukee, on Apr. 23. A very interesting program is being arranged and full details will be announced later.

Lumbermen's Exchange in Monthly Meeting

The regular monthly meeting of the Lumbermen's Exchange, was held Apr. 3. William T. Betts, president, in the chair. A resolution was passed at this meeting in reply to communication from the State Forestry Association, urging the Pennsylvania senators to vote for the bills known as the "Timberland Taxation Bills." The J. A. Finlay Lumber Company was elected a member of the exchange at this meeting.

On Apr. 10 the election of officers and directors for 1913 will take place, after which the annual banquet will be held on roof garden of the Bellevue Stratford hotel.

Northern Cut and Shipments, February, 1913

The production of hemlock and hardwood lumber continued in February at approximately the same rate as in January, the slightly reduced cut being due to the smaller number of sawing days in February. Shipments kept up well and were in especially good volume considering the excessive shortage of stocks. Much hemlock is being shipped in a half dry condition.

The summary of reports for the last twelve months, given below, shows that during this period, hemlock shipments have exceeded the cut by thirty-seven per cent and that hardwood shipments have gone beyond production by fifteen per cent. Shipments of hemlock and hardwood combined have exceeded production by thirty per cent since Mar. 1, 1912.

Reports from seventy-four firms give these totals for February:

Lumbermen's Exchange Annual Dinner

Tonight, Apr. 10, the Lumbermen's Exchange of Philadelphia, is enjoying its annual dinner, following the twenty-seventh annual meeting. The meeting and dinner are being held at the Bellevue Stratford hotel, Philadelphia, the latter being called at seven o'clock.

Philadelphia Lumbermen Discuss Golf

The Philadelphia Lumbermen's Golf Club, is making ready for an active golfing season. The executive committee, composed of J. W. Turnbull, chairman; J. B. McFarland, Jr., R. W. Wister, Ralph Souder and William T. Betts, held a meeting at the Lumbermen's Exchange rooms, Mar. 31, at which it was decided to open the season with a contest on the Riverton Country Club course, Riverton, N. J., in the latter part of April. A handsome silver cup has been presented by the New York Lumber Trade Journal to the Philadelphia Lumbermen's Golf Club, to be contested for in any manner the club may decide.

Chicago Lumbermen in Monthly Meeting

The monthly luncheon and meeting of the Lumbermen's Association of Chicago took place in the red room of the Hotel La Salle on Tuesday, Apr. 1. The usual dinner was well attended and after its completion, President Murdock MacLeod opened the regular business session. The chief question brought before the members had to do with the proposed lumbermen's building for Chicago.

George J. Pope, chairman of the special committee appointed at the meeting on Feb. 10, reported in detail on the work done by that committee in outlining the possible advantages to be derived from the erection of such a structure. He also outlined different ways through which such a building could be financed and its floor space fully rented to concerns in the lumber and allied trades.

Mr. Pope stated that the secretary of the association sent out a general letter on Feb. 26, and at the time of the report there were eighty replies received, of which seventy-five were favorable.

Mr. Pope in his report further stated that it was recognized that the lumber companies alone could not support such a building, and that the question which confronts the special committee has to do with arrangements whereby industries allied with the lumber business could be housed in the same building. It is quite likely that in addition to the Lumbermen's Association headquarters, and the Lumbermen's Club quarters, the various industries closely connected with the lumber business will be given an opportunity of taking office space in the Lumbermen's building. Such trades would be the building trades, stair builders, interior finish houses, etc.

Mr. Pope said that at present there is more office space to be rented in Chicago than there is a demand for, and those in charge should move carefully in putting through a proposition as suggested. He said that 275 letters were sent out on Feb. 26, and up to Mar. 31 replies had been received from seventy-five concerns renting in the aggregate 46,886 square feet of floor space, with an average rental of \$1.64 per square foot. Mr. Pope said that the owners of the new building if it were erected would assume unexpired leases, and would not ask the lumbermen to buy any bonds or subscribe to any stock.

Following a discussion of the plan the meeting adjourned.

Decision on Switching at Baltimore

A decision of much interest to lumbermen was handed down on Mar. 26 in Circuit Court No. 2 by Judge Duffy, when he issued an order sustaining in part and annulling in part the order of the Public Service Commission which fixed the switching charges by railroads in local territory. The order of the commission is sustained and the temporary injunction dissolved in so far as it decrees that the rate for yard switching shall be \$1 per car and for industrial switching not more than \$5 per car. The order of the commission is voided and the injunction against its enforcement made permanent as to that part which provided for connecting line and for intermediate switching. The commission had attempted to fix specific rates for switching from one line of railroad to another, and it was this portion which the court knocked out, the contention of the railroads having been that to sustain such a requirement would virtually mean the loss of traffic and the giving of the benefits of their terminals to competing railroads. A shipper, for instance, finding that the switching rate is a certain amount, might be able to figure out that by shipping over one road he could have his shipment switched to the terminal of the other at a cost perhaps lower than the rate on a through shipment over the road owning the terminal where he wants the car placed. As to the yard and industrial switching charge, the court said it was not convinced, as the railroads contended, that the

rates were confiscatory and unreasonable, and that where there appears to be a narrow margin between possible confiscation and proper regulation, and if the result depends on future operation, the court should not enjoin the enforcement of the order before there has been a fair trial of the new rate. The switching charge agitation dates back several years, various trade bodies here, among them the Lumber Exchange, having, in 1911, instituted proceedings before the Public Service Commission of Maryland and the Interstate Commerce Commission against the railroads having terminals here to obtain a reduction of the charges on the ground that these were extortionate, unreasonable, and burdensome, and that they placed the Baltimore shippers at a great disadvantage as against manufacturers in other cities, with whom they could not compete under the circumstances, the margin of profit being often wiped out by the higher switching charges here. The proceedings before the Interstate Commerce Commission culminated May 14, 1912, in an order to the railroads to establish within thirty days joint rates for the interchange of interstate traffic, the maximum rates to be charged for the service being set forth and exceeding the expectations of the shippers. The Maryland Public Service Commission issued an order on May 31, of the same year, establishing a switching district to include all of Baltimore City and a small territory outside of it, and providing for certain flat rates per car moved within this district, the rates being substantial reductions from those of the railroads. The railroads then appealed to the courts and a temporary injunction was issued, which has now as above stated, been sustained in part and voided in part.

Lewis Doster Makes Change

Lewis Doster for years well-known as the efficient secretary of the Hardwood Manufacturers' Association of the United States, recently completed arrangements for a change in his business activities. He is severing his connection with this association, this connection having been officially severed on March 15, 1913, at which time he was officially engaged to act as general representative for the well-known saw firm, Joshua Oldham & Sons, Inc., Brooklyn, N. Y. Mr. Doster will represent this firm throughout the entire middle western territory, and will maintain an office in the First National Bank building, Cincinnati, O.

While the connection nominally started Mar. 15, Mr. Doster has done nothing actively in his new work, but is still secretary of the association, with the understanding that he will remain in that position until other arrangements can be made as to his successor.

Mr. Doster states that he made the change after looking over the field thoroughly. Mr. Doster's wide acquaintance among the hardwood manufacturers of the country will stand him in good stead in his new position. He will not, however, limit his trade to hardwood mills, but will cover the sawmills manufacturing every kind of lumber in the Middle West.

Lumber Fraud Case Progressing

United States District Attorney Swartley outlined the government's case against the International Lumber & Development Company before the United States district court at Philadelphia, Pa. He declared to the jurors that the prosecution would show that the defendants had defrauded stockholders of the concern out of \$6,000,000 by false representation and misleading literature circulated through the mails. He asserted that 288,000 acres of land alleged to have been owned in Mexico by the defendant was in reality owned by a New Jersey corporation. He further declared it would be shown that the so-called dividends paid semi-annually by the company were not out of the earnings but out of the money collected from the stockholders. He further declared that it would be proven that the company cut only about one-third of the lumber reported cut and that not much of this was cut on the property claimed to have been owned by the company.

The government attorney said that while the International Development Company's circulars claimed that that concern was doing an immense mahogany business; in reality most of the alleged mahogany logs were oak logs. The attorney raised a laugh when he declared that the much advertised "great International fleet" maintained by the company for transportation purposes consisted of one ocean going steamer, one launch, two sail-boats and two row boats.

The defendants are John R. Markley of Chicago; Isaiah B. Miller of Chicago; Charles B. McMahon, secretary and treasurer of the company; Colonel A. G. Stewart, director and commissioner of the company; William Armstrong Jr., general agent for the concern.

The government's attorneys showed methods employed by the company in the sale of its stock, the display of products alleged to have

been grown in Mexico, and the circulation of literature through the mails. Several witnesses were examined.

The latest development in the trial was the reading of a lot of literature sent out by the International Lumber & Development Company in order to prove that this concern used the mails to defraud Alexander Williams, president of the Astoria Veneer Mills & Dock Company, Long Island City, N. Y. Mr. Williams testified that he had signed a contract with John R. Marshall, one of the defendants, to receive and saw logs shipped from the plaintiff. He told of the various shipments received and said the wood was small and unsatisfactory, and that nothing could be said in its favor. He testified that the treasurer of the International company had said that a better quality of timber would be shipped as soon as the better trees could be reached.

Mr. Williams said that W. H. Armstrong, Jr., of the International company in 1905 had asked permission to take photographs of piles of logs belonging to the International company which had been shipped to the plaintiff. He said that Armstrong had taken several pictures which were printed in newspapers and literature, and were represented to be views of piles of mahogany owned by the International Lumber & Development Company. The witness was shown the pictures and declared that one the company claimed to be a pile of valuable mahogany was not mahogany at all, but a pile of English oak logs.

Another representation of a pile of mahogany, according to the witness, was a pile of Mexican mahogany logs belonging to Lewis Thompson & Co., which had been lying in the witness' lumber yard preparatory to being manufactured.

Another was a pile of African mahogany shipped from Africa, and not owned by the International Lumber & Development Company. Still another represented and purported to be mahogany logs really showed maple.

Cadillac Concern Moves to Grand Rapids

A. F. Anderson, who for fifteen years has done a wholesale lumber business at Cadillac, Mich., has decided to move the headquarters of that business to Grand Rapids, Mich., where they will be maintained in conjunction with the offices of the Van Keulen & Winchester Lumber Company in the Michigan Trust Company building. The change will be made some time during the present month.

A. F. Anderson has been in Seattle, Wash., for over a year and will continue to make his home in the Far West. A. F. Anderson's son, who has with Adrian Van Keulen been in active charge of the business, will also make his home in the West. Adrian Van Keulen will continue in charge of the Grand Rapids office.

Red Gum Lumber Company Starts Business at New Orleans

One of the newest organizations starting in the hardwood business in Louisiana is the Red Gum Lumber Company, a concern with \$50,000 capital, which has opened offices in the Maison Blanche building. H. B. Turner is vice-president and general manager and will have active charge of the business.

The company has the entire sale of four Louisiana hardwood mills, having an aggregate daily output of 100,000 feet, which is made up of gum, tupelo, elm, cottonwood, oak, ash and magnolia. It is its aim to do a general wholesale business, both domestic and export.

Mr. Turner has been with Phil I. Adam, prominent in New Orleans as an exporter for a number of years. He severed his business connection with Mr. Adam in order to engage in the new enterprise. Mr. Turner's experience in hardwoods has been extensive, and he is widely and favorably known in hardwood circles.

New York State Forestry Students Get Valuable Experience

The practical work covered by the students of the New York State College of Forestry at Syracuse offers a variety of subjects which result in a broad education on various subjects dealing with the administration of New York forests. The students of the State Rangers School have been making maple sugar on the college forests of 1,800 acres near Cranberry Lake. The school has a complete outfit of spouts, buckets and evaporators, and is in every way well equipped to make sugar and syrup. This work is part of the rangers' instructions.

Ten of the older students of the college of forestry left Syracuse recently for two weeks of practical work in the state nursery at Salamanca, N. Y., where they are working under the direction of Superintendent Warner of the nursery. They are employed as day laborers taking up every line of work in the nursery, such as lifting seedlings and transplanting them and packing transplanted plants for shipment. They also prepare the ground for seed beds, and perform the various other duties necessary in connection with forest nursery work.

LEWIS DOSTER, CINCINNATI, NEWLY APPOINTED GENERAL REPRESENTATIVE OF JOSHUA OLDHAM & SONS, INC.

A Directory of Commercial Organizations

In response to a Senate resolution passed December last, the Department of Commerce has submitted to the Senate a list of the commercial organizations in the United States. This record, with a list of agricultural organizations, will be printed for distribution, provision being made for 1,500 copies for the use of the Senate. The list of commercial organizations was prepared by the Bureau of Foreign and Domestic Commerce, which for nearly two years has been collecting for use in its own work detailed information regarding such organizations, their functions, membership, income, etc. The information in the files of the bureau at the time the resolution was adopted was supplemented by such additional facts as it was possible to obtain before Feb. 15, the date on which the list was to be submitted to the Senate, and this list when published will record about 3,500 national, interstate, state and local organizations.

In the compilation of its information the bureau has utilized various symbols to indicate the field of service and the activities of the various organizations. These symbols have been used in the list submitted to the Senate, so that when published it will furnish in a concise manner a complete record of the organizations, their functions, membership, and other details. The information thus compiled constitutes a directory of commercial organizations of the country such as has never before been prepared and it should prove of practical value to business men.

In addition to the 1,500 copies to be printed for the use of the Senate, the list will be issued as a bulletin of the Bureau of Foreign and Domestic Commerce (Miscellaneous Series No. 8). Copies of this bulletin will be sold for fifteen cents a copy by the Superintendent of Documents, Government Printing Office, Washington, D. C.

A Human Visage Photographed in Log

In connection with this story is seen a really remarkable likeness of human features, which was found on the inside of a block of maple cut at Cadillac, Mich. A representative of HARDWOOD RECORD was recently calling at the office of the Williams Brothers Company, Cadillac, and while enjoying a talk with George F. Williams, the conversation was suddenly interrupted by the intrusion of a man of rather unusually striking appearance. He was tall and shaggy, with a small bullet-shaped head, the most prominent characteristic of which was a long, sharp, rugged face. The forehead was low and narrow and the eyes small. The nose and beard were of truly remarkable length and sharpness.

Upon the intruder's withdrawing, the caller remarked on the unusual appearance he showed. Mr. Williams then with a smile stated that he was an old scrap iron dealer, and then still smiling pointed without speaking to the mantel over the fireplace in his office. Here the block shown in this connection was placed, and the caller was instantly struck with the remarkable resemblance between the profile shown in the block and that of the iron peddler. It seemed that the coincidence was worthy of recording, and the photograph shown was secured.

BREAK STAIN IN A LOG CLOSELY RESEMBLING AN ACTUAL PERSONAGE.

Champion Lumber Company Starts Operations

The last week in March saw the first cut of logs on the timber holdings of the Champion Lumber Company with headquarters at Sunburst, N. C. The first logs were brought to the mill at Sunburst on Mar. 25, and the mill is now operating. It is estimated that it has at least a twenty years' cut ahead. The capacity of the mill is from 135,000 to 175,000 feet daily.

The town of Sunburst is thirteen miles from Canton, N. C., in the Pigeon River region on the Tennessee & North Carolina Railroad. It now has about 500 residents. The operation will bring in at least 1,000 more men so that in the near future the population of the town will be from 2,000 to 3,000.

Broad plans have been laid for making a permanent town of Sunburst, with church, schools and other necessary structures.

Slight Changes in National Hardwood Rules

It is reported from Memphis, Tenn., that there was a conference during the early part of the week between H. A. Hoover, chief inspector of the National Hardwood Lumber Association, J. M. Card of Chattanooga, and J. M. Pritchard and John W. McClure of Memphis, Tenn., members of the inspection committee. These men were appointed as a sub-committee to the regular grading rules committee. The object of the sub-committee's work is to put proposed changes in such form that they will be readily understandable. So far nothing very radical has been proposed.

Increase in Capital Stock

A communication from the Mansfield Hardwood Lumber Company of Shreveport, La., states that at a recent meeting of the board of directors of that company, the paid up capital stock was increased from

\$50,525 to \$100,000. The Mansfield Hardwood Lumber Company deals in hand-sawed hardwood lumber, specializing in thin oak and ash. Its white oak is well equalized and is of true forked-leaf variety.

The company has band mills at Mansfield and Winnfield, La. It maintains a hickory strip mill in connection, and turns out buggy shafts, rims, poles, etc.

Trip Planned by Arkansas Lumbermen

The Lumbermen's Club of Arkansas is completing arrangements through its secretary, F. R. McIntyre of Pine Bluff, Ark., for a proposed trip of the club members to include every sawmill in the state. It is planned to charter a special train of Pullmans, on which the lumbermen will live during the entire trip. This train will leave Little Rock on May 19.

Mr. McIntyre is secretary of a special committee appointed to carry on the work, and is assisted by C. J. Baer and C. A. Bushnell. Most of the work involved has already been accomplished. It is expected that fully one hundred Arkansas lumbermen, members of the Arkansas Lumbermen's Club, and especially invited guests, will take the trip. From these figures it can be seen that the special train will be of considerable length inasmuch as in addition to the sleepers it will carry a baggage car, dining car and observation car.

The trip will have as its object the unifying of methods through observation on the part of each member of the operators of others. It is also planned to considerably stimulate interest in the possibilities of developing cut-over lands.

The Arkansas Lumbermen's Club is of rather recent origin, but it is considerably alive in every detail of its work. The club consists of seventy-five members, all of whom are large manufacturers.

Cincinnati Plant Burns

On Thursday night, Mar. 27, the extensive lumber and millwork plant of Chas. S. Ferris, located in the east end of Cincinnati, was destroyed by fire. The destruction of the plant is complete so far as can be ascertained at this time due to the high water which has since completely submerged the territory where the mill stood. The loss will total about \$40,000 and is covered by only about \$25,000 insurance. Chas. S. Ferris did a retail business principally in yellow pine and also was a manufacturer of all kinds of millwork for the building trade, most of which was on special orders.

Fire Destroys Arkansas Yard

T. J. Ellis & Co., Ellisville, Ark., advise that fire broke out on Saturday morning, Mar. 22, in their lumber yard at Ellisville and destroyed 650,000 feet of hardwood lumber. The loss incident to the fire was \$25,000. The company had only \$15,000 insurance on the whole yard, including lumber valued at \$25,000, which was not destroyed. It is supposed that the fire originated in a pile of pecky cypress and that it started with a cigarette which some one had thrown into the lumber.

Advanced Idea of the Underwood Veneer Company

The Underwood Veneer Company of Wausau, Wis., has just inaugurated a new plan which will work to the great benefit of the boys employed at its plant. Instead of taking its boy employees' entire time, it has arranged to work them in two shifts. About twenty boys in all are employed at the factory and they will work in relays of ten each. In other words, ten boys will work in the morning and attend school in the afternoon for a week, while the other ten are at school in the morning and at work in the afternoon. In order to equalize the benefits, the relays are shifted each week. This enables the boys to get more schooling than they possibly could under the five-hour plan, and further enables the Underwood Veneer Company to carry out its ten hour working schedule at the mill. This plan exemplifies the modern conception of the employer's relation to his employees.

German Agent Opens Paris Office

Richard Koeller of Hamburg, Germany, advises HARDWOOD RECORD that in the latter part of March he established a branch office at Svis avenue Persier, Paris, France. The new office will be under the management of Ed. Leisieux-Sigaux. Mr. Koeller is the German selling agent for all kinds of American lumber and logs, oak staves and headings.

Philip A. Ryan Builds New Hardwood Mill

The Philip A. Ryan Lumber Company of Memphis, Tenn., recently completed and put into operation its new hardwood mill at Onalaska, Tex. The equipment of this plant is modern in every respect and undoubtedly represents the finest type of hardwood mill construction. It has a capacity of 50,000 feet daily. The prospect for trade in the very beginning of the operation is that it will continue to run to capacity constantly.

Escanaba Lumber Company Will Build New Mill

The sawmill of the Escanaba Lumber Company of Masonville, Mich., which was burned about a year ago, will be replaced shortly according to an official statement emanating from the offices of the Escanaba Lumber Company. It has not been definitely decided as yet whether the new mill will be erected at Masonville, Escanaba or some other point. The company has recently made large purchases of timber, and it desires to have the mill as convenient as possible to these holdings. The company is arranging for the purchase of a complete equipment for the proposed new plant. This machinery will consist of two band mills and a resaw. It is planned to have the equipment and arrangement equal to that of any mill on the upper peninsula.

The recent timber deal in which the Escanaba Lumber Company was involved, secured for it extensive stands of timber in Alger, Schoolcraft and Luce counties. The consideration amounted to \$230,000.

Building Operations for March

Official reports from forty-five cities throughout the country, compiled by The American Contractor, Chicago, show a loss for March of 3½ per cent, as compared with March, 1912, and the first 3 months, as compared with the like period in the past year, show a gain of 5 per cent, the cities gaining being as follows: Akron, 7 per cent; Baltimore, 40; Buffalo, 21; Cedar Rapids, 38; Chicago, 83; Grand Rapids, 13; Harrisburg, 3; Indianapolis, 96; Los Angeles, 8; Manchester, 10; Milwaukee, 52; Nashville, 143; Newark, 94; Omaha, 9; Philadelphia, 32; St. Joseph, 179; St. Paul, 54; Scranton, 31; Seattle, 33; South Bend, 18; Toledo, 51; Wilkes-Barre, 6; Worcester, 60. For the three months the largest percentage of gain was scored by Duluth, 55; St. Joseph, 179, and Nashville, 143. Particulars will be found in the following table:

City.	March, 1913.		March, 1912.		Per Cent Gain.	Loss.
	Cost.		Cost.

Kentucky Lumber Company Loses Logs

The log booms of the Kentucky Lumber Company at Burnside, Ky., broke on Mar. 31 due to the excessive rise of the Cumberland river. Fifteen thousand logs were swept away. Most of these were high-grade oak and poplar and every effort was made immediately to again get hold of them. As a result of strenuous efforts a large percentage of the logs were recovered, and the loss was comparatively slight. The Kentucky Lumber Company's headquarters are at Cincinnati, O.

Philippine Timber Company Ready for Operation

It is announced that a company of eastern capitalists is forming a gigantic organization for the purpose of exploiting the hardwood timber of the Philippines. The active representative of this proposed concern is D. A. Utter, surveyor-general of Idaho. Mr. Utter recently returned from a trip to the Philippines where he spent five years investigating the forest resources of the islands, and laying out the best possible plans for milling and transporting of forest products.

It is probable that a line of freight steamers will be established bringing the lumber to various ports of this country and abroad. The backers of the proposed company are now negotiating for two tracts of 500 square miles each on one of the islands.

New Pittsburgh Concern

The Manufacturers' Lumber Company is the style of a new organization which has just begun business at Pittsburgh. The company will have offices in the Park building, and will carry on a general wholesale lumber business. C. M. Pomeroy is president, E. J. Flautt, vice-President and A. E. Murphy, secretary and treasurer. Mr. Pomeroy has been connected for sometime with the Babcock lumber interests. Mr. Flautt has been associated with the Goodyear Lumber Company, Buffalo, while Mr. Murphy has conducted a concern in Pittsburgh under his own name.

There will be no connection between the new concern and any of the old companies represented.

Issues New Manufacturers' Rules

According to the latest bulletin of the Hardwood Manufacturers' Association of the United States, dated Mar. 26, the new issue of the grading rules is about ready for distribution at this date. These rules will become effective May 1. It is suggested by the bulletin that members requiring copies of the new issues send in their requests for the same as promptly as possible in order to give an idea of the number of books which will have to be printed.

There are quite a number of interesting changes, and the bulletin further advises that if any information is wanted regarding the interpretation of the new rules, the office of the association will be glad to explain further.

New Road for Memphis Concern

The Batesville and Southwestern Railroad connecting Batesville, Miss., on the Illinois Central, and Charleston, Miss., on the Yazoo & Mississippi Valley, will soon be completed. This road runs through the timber holdings of R. J. Darnell, Inc., Memphis, Tenn., and will tap a richly timbered area. It will enable Mr. Darnell to secure a vast quantity of logs in territories which he has not worked up to this time.

Hardwood News Notes

< MISCELLANEOUS >

The Florouce Wagon Works is reported to be reorganizing at Florence, Ala.

The Ludington, Wells & Van Schaick Company is organizing at Menominee, Mich.

The C. O. Biggs Chair Company, Dexter, Mo., has incorporated with a capitalization of \$8,100.

The Elkhart Furniture Works, Elkhart, Ind., has been incorporated with a \$10,000 capital.

The Brownlee Company will succeed the Brownlee-Kelly Company, Detroit, Mich., on Apr. 30.

An involuntary petition in bankruptcy has been filed by the Rockford Novelty Works, Rockford, Ill.

The capital stock of the Allegheny Lumber Company, Pittsburgh, Pa., has been increased to \$50,000.

The Charlevoix Lumber Company, Charlevoix, Mich., has incorporated, the capitalization being \$500,000.

The Knoxville Veneer Company, Knoxville, Tenn., has increased its capital stock from \$25,000 to \$50,000.

The Booker-Cecil Lumber Company, Louisville, Ky., has incorporated with an authorized capital stock of \$50,000.

At Asheville, N. C., the Wolf Manufacturing Company has been incorporated with a capital stock of \$150,000.

The Unique Furniture Manufacturing Company has been incorporated at Flint, Mich., with a capital stock of \$150,000.

The Carolina Veneer Company has been incorporated at Biltmore, N. C. This company has a capital stock of \$50,000.

The Snyder & Fuller Furniture Company, Lake Odessa, Mich., has been succeeded by the Denton & Chappell Manufacturing Company.

A decrease in capital stock has been made by the Compressed Wood Preserving Company, Cincinnati, O., from \$200,000 to \$50,000.

The Ovid Furniture Manufacturing Company has been organized at Ovid, Mich. The company has a capital stock authorized of \$60,000.

The Sprigg Lumber Company has been organized at Weston, W. Va., with a capital stock of \$15,000. The company will deal in forest products. The name of the Michigan Hearse & Carriage Company at Grand Rapids, Mich., has been changed to the Michigan Hearse & Automobile Company.

The Snyder Manufacturing Company, a furniture concern of Logan, O., is planning to rebuild its plant which was destroyed by fire at that point several months ago.

The Allis-Chalmers Company, Milwaukee, Wis., has incorporated under the style of The Allis-Chalmers Manufacturing Company with a capital stock of \$42,500,000.

The Scarritt-Comstock Furniture Company recently leased a plot of ground at Main and Dock streets, St. Louis, where it will erect and operate a furniture factory.

Henry Isserman & Son of Bealville, Ind., are planning to start their new veneered door factory at that place by the first of May. The plant will have an output of 200 doors a day.

The dimension plant of Holmes & Balmer, Lima, O., was recently completed. This company will specialize in wagon stock and baseball bats. Its plant is modern in every particular.

The Three States Manufacturing Company, Kenova, W. Va., has been succeeded by the Breece Manufacturing Company, which concern has its headquarters at Portsmouth, O., manufacturing rims and spokes.

The Section-fold Company, Inc., has been incorporated at Brooklyn, N. Y., with a capital stock of \$25,000. The company will manufacture cabinets, sectional cases, etc., and will deal in lumber of all kinds.

The Forsythe Dining Room Furniture Company recently incorporated at Winston-Salem, N. C., will shortly erect a new plant for the manufacture of dining room furniture. This company has a capital stock of \$250,000.

The sawmill plant of the Southern Lumber & Boom Company at Valley View, Ky., on the Kentucky River, has been purchased by Milikan & Aldridge of New York, and has been shipped to Irvine, Ky., where it will be rebuilt and become part of that firm's extensive operations there.

J. F. McIntyre & Sons, Inc., are spending considerable money in improving the hardwood sawmill at Pine Bluff, Ark. In addition to doubling the capacity of the power plant, a new vertical resaw and a heavy trimmer and edger will be installed, which it is anticipated will double the capacity of the mill.

The Fordyce Manufacturing & Ice Company of Fordyce, Ark., is busily engaged in reconstructing and enlarging its hardwood mill at Fordyce. The old plant will be entirely removed and set up again on the Rock Island road in that city. The present plant is on the Cotton Belt. The sawmill is equipped with circular saws, and will have a capacity of 35,000 feet per day.

CHICAGO

John S. Weidman, of Mount Pleasant, Mich., president of the Weidman & Son Company, Trout Creek, Mich., spent a few days in town this week.

H. W. Nordyke of the Adams & Raymond Veneer Company of Indianapolis, Ind., was in town the early part of this week. He says that his plant, though shut down, was not damaged by the flood and is now operating normally.

The fourteenth annual special issue to the Timber Trade Journal published at London, England, dated Mar. 29, is a most unusual number in every respect. It contains 325 pages of reading matter and advertising, and the feature is an historical review of the development of the lumber industry in English, Scottish and Swedish points.

E. B. Nettleton, well known in lumber and lumber trade journal circles, has just started the wholesale and commission business in hardwoods, Inland Empire and Pacific coast products. Mr. Nettleton is maintaining an office in the Fisher building.

I. A. Minnick, vice-president of the National Dry Kiln Company of Indianapolis, was in Chicago for several days last week, and favored **HARDWOOD RECORD** with a call.

W. D. Wheeler of the Wheeler-Bissell Lumber Company, Marshfield, Wis., made a business trip to Chicago last week.

I. A. Bushong of the Northwestern Coöperage & Lumber Company, Gladstone, Mich., has been in the city on business for several days.

Walter N. Kelly, the hardwood man of Detroit, was in Chicago on a business visit on Apr. 8.

E. B. Norman of the Norman Lumber Company of Louisville, Ky., and Holly Ridge, La., was in the city the latter part of last week.

Louis Doster, secretary of the Hardwood Manufacturers' Association, who will shortly take up his duties as general representative of Joshua Oldham & Sons, Brooklyn, N. Y., was in Chicago most of last week.

F. T. Peitch, prominent in lumber circles at Cleveland, O., called at this office on Mar. 28.

George M. Cornwall, the capable editor and publisher of "The Timberman", Portland, Ore., was a welcome caller at this office on Apr. 8. Mr. Cornwall was in Chicago attending the box case hearing before the Interstate Commerce Commission on behalf of the Pacific coast box interests. Before leaving for home he will visit his mother and other relatives at New York.

F. F. Fee of the Fee-Crayton Hardwood Lumber Company, Dermott, Ark., was a visitor at Chicago during the week. Mr. Fee has been away

from his office for a couple of months and is planning to sail on May 10 for an extended business trip abroad. He will be accompanied on this trip by some of his associates.

M. L. Pease of the Galloway-Pease Company of Saginaw, Mich., and Poplar Bluff, Mo., was in the city on business for a few days last week.

E. W. Benjamin, manager of the Cadillac Veneer Company, Cadillac, Mich., was in the city for a few days this week on business.

J. C. Knox, secretary of the Michigan Hardwood Manufacturers' Association, Cadillac, Mich., and R. S. Kellogg, secretary of the Northern Hemlock and Hardwood Manufacturers' Association, Wausau, Wis., attended the hearing in Chicago on Apr. 3 and 4 on the Pridham case, as extended from the Los Angeles, Cal., hearing, involving rates on wooden vs. fiber containers.

Horace Taylor, president of Taylor & Crate, Buffalo, N. Y., was in the city on business some time ago, and favored **HARDWOOD RECORD** with a call on Mar. 25.

F. D. Timlin of the Wheeler-Timlin Lumber Company, Wausau, Wis., spent several days in conference with his partner in Chicago, the early part of the month.

W. M. Stephenson, Supreme Scrivenor of Hoo-Hoo, spent the last few days of March in Chicago.

E. H. Donaldson of Mason-Donaldson Lumber Company, Rhinelander, Wis., was one of the distinguished visitors to the local trade recently.

W. A. Ranson of the Gayoso Lumber Company, Memphis, Tenn., made a visit of several days' duration with the Chicago trade, the early part of the week.

E. E. Taenzer of I. M. Darnell & Sons, Memphis, Tenn., spent the week of Mar. 24 with the local trade.

C. B. Allen, manager of the veneer department of the Anderson-Tully Company, Memphis, Tenn., has been in Chicago for a couple of weeks on a selling trip.

J. A. Levings, president of the Moorhead Manufacturing Company, Moorhead, Miss., spent the first week in April with the local trade on a business trip.

NEW YORK

E. H. Barton of Barton, Thompson & Company, lumber and timber importers of London, England, is on a business trip to American mills. This firm is one of the largest importers of American lumber, and Mr. Barton is well-known to manufacturers in the States.

George M. Stevens of the Stevens-Eaton Company, prominent wholesaler, is on a trip to the Pacific coast lumber markets in the interest of business. In addition to its hardwood lumber department this company handles a large volume of softwoods including Pacific coast stocks.

A visitor to New York during the fortnight was Hugh McLean, the prominent Buffalo hardwood lumberman. Mr. McLean spent several days in town in the interest of business.

The Santo Domingo Hardwood Company recently took offices in the Hudson building, 32 Broadway, this city.

The Milne Brothers Company, wholesale hardwood specialist of 18 Broadway, has been incorporated under the same style with a capital of \$30,000. The incorporation is nothing but a formality and the business will be conducted as heretofore without any change.

Jesse C. Hofer, for many years prominent in the wholesale trade of this city, has engaged in a selling capacity with the Blanchard Lumber Company, and will assist Manager Loomis of the New York office. Mr. Hofer had been out of active business for some time because of ill health but is now fully recovered and ready for active business.

Russell Johnson Perrine, president of the New York Lumber Trade Association, and head of Johnson Brothers, Brooklyn, returned last week from a trip to the Panama canal zone. Like every one else who has made this trip Mr. Perrine was greatly impressed with the enormous proposition which the government is now hurrying to completion.

Fire on Apr. 1 damaged the stock of lumber and plant of the National Show Case Company, 486 Leonard street, Brooklyn.

The affairs of Collins, Lavery & Company, bankrupt, have been settled and the receiver discharged. The settlement comprehends the acceptance of extension notes in full for all claims. The business will be continued with Frederick W. Cole as president, and James L. Noble, vice-president. The creditors will be represented on the board of directors.

J. S. H. Clark Lumber Company, recently incorporated, have opened offices at 4 East Forty-Second street. The firm will conduct a general wholesale lumber business. The officers are J. S. H. Clark, president; W. G. Mennen, vice-president; F. M. McCracken, treasurer, and A. B. Clark, secretary.

BOSTON

George W. Butler, formerly with B. D. Peterson, Jr., Boston, has started in the commission lumber business for himself. He has opened an office in the State Mutual Life building.

B. D. Peterson, Jr., who for several years has conducted a lumber business in Boston, has been petitioned into involuntary bankruptcy. Mr. Peterson left Boston early in March and his present whereabouts are unknown.

The Cottage Lumber & Supply Company, Hartford, Conn., has been

Incorporated with a capital stock of \$5,000. E. L. Nettleton is president and treasurer and Orin L. Nettleton, vice-president.

Frank M. Faylor has purchased the lumber business in Gardner, formerly carried on by the late Milton M. Faylor.

The New Hampshire Lumbermen's Association held its annual meeting at Manchester, N. H., Mar. 20. Warren Tripp, who has been president since the association was organized, refused a renomination owing to poor health. The officers elected were: President, Irving H. Chase, Plymouth; vice-president, John H. Walker; treasurer, L. Ashton Thorp; directors, Samuel D. Felker, Governor of New Hampshire, James B. Tennant, J. B. Fellows, Frank B. Clark and Charles A. Bailey.

The West River Valley Lumbermen's Association held its annual meeting in Brattleboro, Vt., Mar. 19. The officers elected were: President, J. C. Tibbetts of Wardsboro, Vt.; vice-president, Frank H. Braser; secretary and treasurer, Willis H. Taft; executive committee, George D. Williams, C. H. Willard, F. H. Sanford, L. A. Cook and Julian Taft.

T. H. Shepard of the Shepard & Morse Lumber Company, Boston, has recently visited the company's plant in Burlington, Vt.

← PITTSBURGH →

The Pittsburgh Wholesale Lumber Dealers' Association recently elected J. L. Kendall of the Kendall Lumber Company, president; A. D. Knapp of the Nicola Lumber Company, vice-president; J. G. Criste of the Central Lumber Company, secretary and treasurer; Louis Germain, Jr., of the Germain Company; Edward Eiler, O. H. Babcock of the Babcock Lumber Company, William H. Schuette of William Schuette & Co. and W. W. Dickey of the West Virginia Lumber Company, directors.

The Brown Brothers Lumber Company of Punxsutawney, Pa., will start work shortly to cut off a 7,000 acre tract of hardwood and hemlock near Murchison, N. C., which it bought two years ago. It will put in a modern band and resaw mill with capacity of 60,000 feet daily and expects to be busy eight years on this operation. The officials of the company, all of whom lived at Punxsutawney, are: President, W. F. Brown; vice-president, D. J. Brown; treasurer, P. L. Brown; secretary, G. C. Brown, director, S. A. Rinn.

The Pennsylvania Railroad Company has decided to build a big creosoting plant at Middletown, Pa. This is the result of a trip of its agent, Grant P. Shipley, to Europe to investigate creosoting methods there.

The plant of the R. B. McDanel Company at New Brighton, Pa., on the Ohio river, was practically ruined by the recent flood, the damage being estimated at \$15,000. The plant of the Kennedy Keg Company a little farther down the river was also considerably damaged.

The Adelman Lumber Company in its new offices in the Park building is doing a very nice business in hardwoods. A. Adelman, president, just escaped being washed out in the Ohio flood lately.

The Duquesne Lumber Company, which handles the product of the Pittsburgh Lumber Company, reports a part of the latter concern's railroad washed out near Bramer, Tenn., where its big plant is located. President A. Rex Flinn has gone down to oversee the repairs.

Frank E. Smith of C. E. Breitwieser & Co., is on a hardwood buying expedition in the South and expects to make some very desirable connections before he returns. This company's hardwood business is coming up right along and it looks for a fine trade all summer.

The Standard Box & Lumber Company's plants at Millvale, a short distance up the Allegheny river from Pittsburgh, were sold last week at public auction to Robert Ostermeier of this city for about \$29,000. The sale included the box factory which has been operating several years, considerable stock and the real estate.

J. J. Linehan, who represents exclusively the Mowbray & Robinson Company in this territory, has gone to Cincinnati to learn the extent of the flood damage to his firm there and also at its plants in Kentucky. Its hardwood trade, especially in oak and poplar, has been very satisfactory the past few weeks.

The plant of the Mack Axle Works in Beaver Falls, Pa., has been taken over personally by John Mack who was formerly a part owner, the consideration being \$75,000. Over 150 skilled men will be employed and a large sum will be spent on remodeling the plant.

The Foster Lumber Company has bought recently more timber in West Virginia and is now running a half dozen hardwood mills in tri-state territory. It has orders on hand to keep it busy for several months and is shipping a large amount of white oak especially.

The Shreve Chair Company, whose factory at Union City, Pa., was burned a few days ago, has let the contract for a new reinforced concrete plant three stories high and 86x400 feet. It is expected that the new plant will be ready for business by Aug. 1.

← BUFFALO →

President James A. White of the National Lumber Company has lately been in Chicago looking after the lumber vessels of the W. H. White Company, which are about ready for the sailing season.

G. Elias of G. Elias & Bro. has been making an eastern business trip in the interest of the firm. The office reports a good demand for hardwoods and excellent prospects for building here this spring.

B. E. Darling of Blakeslee, Perrin & Darling has been South lately, looking after lumber purchases. The yard of the company has a large quantity of plain oak coming in at present.

Hugh McLean has been a busy traveler as usual lately, looking after

the company's business in the East. The yard has a good assortment of oak and other hardwoods on hand.

Scatherd & Son, who are among the pioneers in the use of mahogany, especially for inside finish, still find it quite an uncertain wood in the minds of architects, with the demand rather light at present.

F. M. Sullivan of T. Sullivan & Co., who has been looking after the hardwood trade pretty closely of late, is planning a trip to Atlantic City for a resting spell, although he states that the hardwood demand is good.

Anthony Miller's yard has been handling a good amount of incoming and outgoing lumber recently, demand being well distributed and including oak, ash and basswood.

The Emporium Lumber Company is still considering the fate of the Buffalo office, with a prospect of closing it altogether after a while. The extensive new offices in Utica will be ready for occupation on May 1.

The Buffalo Hardwood Lumber Company has a lot of lake lumber to come forward early this spring, much of it birch. More of this same wood will be handled from the Adirondacks this season.

Miller, Sturm & Miller have been getting in oak and ash lately, and report that the flooded situation in Ohio is causing a good deal of derangement to lumber movement from the South.

The Public Service Commission has ordered a reduction of rates charged in Buffalo for electricity, as well as gas. The reduction in power amounts to about thirty-three and one-third per cent. This will be of great advantage to this city in a commercial way. O. E. Yeager, who was formerly chairman of the electric light and power committee of the Chamber of Commerce, states that a number of large factories might have been secured for Buffalo within the past two or three years if the power rates had not been so high. He predicts that the reduction will be very stimulating to Buffalo's prosperity.

John W. Welch is here from Memphis, where he located some time ago as a member of the hardwood firm of Welch Brothers. He states, however, that he will go back to British Columbia about August to resume regular operations there.

Jackson & Tindle are moving this month to the New York Telephone building, which will be their headquarters in future. The yard on Niagara street has been given up, owing to the location having been outgrown. It is expected that a more roomy yard will be purchased later.

← PHILADELPHIA →

Samuel H. Shearer of Samuel H. Shearer & Son says things are moving satisfactorily, with signs potent for ample future trading. William P. Shearer is in Atkinson, N. C., superintending the erection of a planing mill for the firm, which will manufacture sidings, roofers, factory flooring, etc. The plant will have a capacity of about 30,000 feet a day.

Schofield Brothers at the end of their fiscal year on Mar. 31 testify to a remarkably prolific year's business. Robert W. and John H. Schofield are in Schofield, S. C., to attend the annual meeting of the Saltkeatchie Lumber Company, which is controlled by this prominent Philadelphia house.

The Haddock-France Lumber Company, Mt. Sterling, N. C., is rushed to full capacity, and at the present time is turning out some extra fine stuff. Howard B. France, secretary and treasurer of the Haddock-France Lumber Company and the Monarch Lumber Company, which is the sales end, reports a brisk activity, with outlook stimulating. Demand for low grades far exceeds the supply.

W. S. W. Kirby of the Kirby & Hawkins Company says everything is running without a hitch. They are so busy on railroad supplies and overhead material, they can hardly find time for the general lumber business.

J. S. Maris of the Maris & De Witt Lumber Company complains only of the difficulty of getting the desired material. The company is able to sell almost anything at this time without the least exertion.

Ralph Souder of Hallowell & Souder says they have no fault to find with business. Orders are coming in freely—which requires a lively hustle these days to keep the supply up to the demand. They have added another office and now occupy the whole southern side of the Harrison building.

Arthur W. Kent, secretary and treasurer of the J. S. Kent Company, admits a little concession in some lines, but on the whole prices are well sustained. J. E. Troth, president of the company, is taking a much deserved recreation, with his family, in the shape of a month's trip to Bermuda.

Among the recent visitors to the Lumbermen's Exchange and the trade, were F. R. Stevens of the Robert Dollar Company, San Francisco, Cal., and Jacob Eisenberger, superintendent of the Penn Sumter Lumber Company, Sumter, S. C.

Norman A. Perry, manager of Robert C. Lippincott, reports accelerated business. The placing of orders is now the easiest part of the business, but stocks are still scarce and difficult to secure.

The Woodlawn Lumber Company, Woodlawn, Pa., was chartered under Pennsylvania laws, Mar. 27, with a capital of \$50,000.

The Philadelphia-Vancouver Timber Company, Wilmington, Del., obtained a charter under Delaware laws, Mar. 29, capitalized at \$60,000.

The Red Lion Table Company, Red Lion, Pa., was incorporated under Pennsylvania laws, Mar. 31, with a capital of \$50,000, by George M. Holzinger.

◀ BALTIMORE ▶

The Reinle-Salmon Company, manufacturer of show cases and store fixtures, has obtained a permit for the addition of two stories to the factory building at Stockholm and Warner streets, which will make the building four stories. The structure covers a lot 112 by 40 feet. The cost of the improvement is estimated at \$6,000.

F. X. Ganter, another show case and office fixture maker, is erecting two warehouses in connection with his plant at Leadenhall and Stockholm streets, the demand for the firm's product having outgrown the capacity of the plant.

Still another improvement is the proposed erection of a five-story fire-proof building as an addition to its factory by the furniture manufacturing firm of Levenson & Zenitz, 3 North Gay street. The firm has been recently incorporated as Lenson, Levenson & Zenitz, Inc. The projected structure will front 100 feet on Frederick street, running back on Fayette street 165 feet to Gay, where it will have a front of 92 feet. The machinery to be installed will be of the latest pattern, and the cost of the improvement is estimated at \$250,000.

The litigation over 50,000 acres of timber and coal lands in McDowell county, W. Va., carried on by the late Max Lansburg of Baltimore, has been revived by his son, Max Lansburg, Jr., who sues as administrator of his father's estate and seeks to recover the land, in which aim his father was unsuccessful. The suit is against Henry B. McCormick, the W. M. Ritter Lumber Company, the Pocahontas Coal & Coke Company and others, the Ritter company and the Pocahontas company having the timber and coal rights on a large portion of the property, which is valued at more than \$5,000,000. The proceeding is in progress in the United States court at Charleston, W. Va. The father of the plaintiff once owned the tract in question, but it was sold to satisfy a judgment, contrary, it is alleged, to the Federal statutes. The administrator seeks to have the former judgment set aside and is endeavoring to obtain possession of the property through a tax sale.

R. E. Wood, president of the R. E. Wood Lumber Company, has just concluded the purchase of a tract of timberland at Earhardt station, on the Virginia & Southwestern Railway, south of Bristol, Tenn., in Sullivan county, Tenn. The tract includes about 2,000 acres, and for about two years will suffice to run a pony hand mill to be erected there.

David T. Carter of David T. Carter & Co., returned last Monday from a trip to southwestern Virginia and eastern Tennessee, the trip being undertaken mainly in search of suitable hardwood stocks. Mr. Carter was able to get only about two-thirds of the lumber he wanted, finding that the mills are out of stock and that prices are uncertain and high. Everywhere he heard the same story of selections having been absorbed by the demand and of the output of the mills falling behind the requirements of the market.

For the quicker detection of forest fires in the Blue Ridge mountains of Maryland the state will erect on High Knob, south of Quirauk, near Pen-Mar, a steel tower thirty feet high. The fire wardens are to pass the tower every day and take observations. From the tower they will be able to command a view over a wide stretch of mountain land, and detect any incipient fires that may have broken out.

E. E. Price of the Thomas Hughes Company, Keyser building, was on a trip to Pennsylvania last week, looking up buyers and stocks as well. He found buyers plentiful enough, with stocks by no means in liberal supply. In fact, lumber proved hard to get.

◀ COLUMBUS ▶

The principal event in hardwood circles in Columbus and central Ohio during the past fortnight was the unprecedented floods which swept the country. Waters in the Scioto, Olentangy, Miami, Mad and Muskingum rivers were higher than ever before and other streams were in about the same condition. As a result the hardwood trade was completely paralyzed and little was done.

Railroad transportation from all sections was cut off for days and traffic will not be normal for weeks and even months because of the large number of railroad bridges washed away. Mail was delayed and business of every kind was at a standstill.

One of the effects of the flood was the demand for timbers for temporary railroad construction and all yards located near railroads were sold out in short order when the waters subsided. The destruction of hundreds of frame houses in the West Side—the flooded district—will also mean a large market for lumber when the time comes for rebuilding.

A large number of retail and wholesale hardwood concerns in Columbus were badly damaged by the high waters. Among the number was The Doddington Company at 447 West Broad street. The company's plant was flooded and thousands of feet of lumber were lost in the current. The concern has established temporary offices in Room 207 Central National Bank building and business is going on about as usual. The West Side Lumber Company, West Broad street and the Big Four tracks, which also sustained some loss, is filling orders of the Doddington Company.

The M. J. Bergin Lumber Company, West Spring street and Dennison avenue, also sustained a heavy loss because of the high waters which wrecked sheds and drifted lumber away.

The Whitacre Lumber Company, 451 West Broad street, was also a

heavy loser from the flood. The yard, located at McDowell street was flooded and the loss is estimated at \$6,000.

The Buttles Avenue Lumber Company was a heavy loser as its yards were completely submerged. The loss will amount to thousands of dollars.

The Acorn Lumber Company, West Rich street, is another of the concerns which sustained a heavy loss. It is believed the damages will amount to close onto \$10,000.

Cones & Menefee, 450 West Broad street, was probably the heaviest sufferer from the floods. The plant, located right in the heart of the flooded district, was almost completely destroyed and the larger part of the lumber, amounting to hundreds of thousands of feet, was swept away.

The Columbus Lumber Company, on West Spring street, is one of the heaviest losers from the flood. Thousands of feet of lumber was lost and some of the sheds were destroyed.

R. W. Horton, sales manager for the central division of the W. M. Ritter Lumber Company, says trade was at a standstill during the flood, but since it is over there is a rush of orders from retailers who sold out their stock to railroads for construction work. Factories are also in the market for stocks. The high waters did not affect the mill district of the company located in the South.

L. B. Schneider, sales manager of John R. Gobey & Co., says there is a good demand for hardwoods and prices are firm. This concern looks for a good trade from this time on.

E. Everson Powell of the Powell Lumber Company says trade is as good as could be expected under the conditions with prices ruling firm.

◀ TOLEDO ▶

The Gotshall Manufacturing Company has purchased a supply of new machinery for its mill at Archbold, O. The shipments were held up en route because of the flood but sustained no injury.

One of the remarkable incidents of the Dayton flood is to be noted in the fact that "The Log Cabin," the first house constructed in Dayton, on the south bank of the Miami right in the path of the flood where the full force of the waters struck it, is still standing. This is the more remarkable when it is remembered that many brick and concrete residences were carried away or demolished.

Orders have been coming in very freely to the Booth Column Company, but great difficulty has been experienced by this concern in getting shipments under way and there has been considerable delay and congestion at the plant on this account. The railroads with one or two exceptions for practically a week refused all freight shipments through flooded territory. Shipments were begun Friday of last week, however, and it is hoped within a few days to have caught up and have things running smoothly again.

One of the heavy losers in the Ohio floods was the Turabull Wagon Company, which operates a plant at Defiance. This is one of the oldest industries in that city and was largely instrumental in building up the eastern part of the town. It is situated on the banks of the Maumee river and lost heavily from the inundation of shops, causing injury to machinery as well as carrying away large quantities of lumber. In addition to manufacturing wagons, the concern manufactures automobile wheels. The loss is estimated at practically \$100,000. The regular employes of the factory have been busy ever since the flood trying to clean up the plant. It is not known just how soon it will be ready for operation. This is largely a Toledo owned corporation.

The J. M. Skinner Bending Company reports orders as coming in with more than ordinary rapidity and the factory is busy trying to keep up. This concern escaped all water damage.

The Bryan Show Case works of Bryan, O., which was destroyed by fire some time ago, is being rebuilt. The new building will be a two-story brick structure 175x50 feet and will have a one-story 100-foot brick ell. There will be 16,000 feet of floor space.

"We have more orders than we can well attend to," was the report from the Toledo Bending Company. "Our one difficulty has been found in the refusal of railroads to receive freight for shipment for several days. The roads are now all in good shape, however, and the congestion has been relieved. We look for a big season."

◀ INDIANAPOLIS ▶

The Chicago Veneered Door Company of Illinois has been certified by the secretary of state to do business in Indiana. Of its \$25,000 capital \$20,000 will be represented in Indiana.

The Schoenrump-Worden Rack Company's plant at Shelbyville was destroyed by fire with a loss of \$8,000, after the company, which manufactures clothes racks, had been in business three weeks.

Edwin R. Hamilton, for many years in business at Martinsville, died at the home of his daughter in this city recently. He was seventy years old, and is survived by three children. The body was taken to Martinsville for burial.

Building permits issued by the city during March amounted to \$754,305 as compared with \$558,780 in March, 1912.

Two carloads of mahogany logs valued at \$10,000 were washed away by the flood at Lawrenceburg, Ind., a few days ago. They had been consigned to Lawrenceburg veneer mills.

About \$10,000 loss was caused by fire at the furniture plant of the Cabinet Makers Union in this city on the night of April 4. The fire

started in shavings in the boiler house. This was the third serious fire at the plant, which was established in 1862.

Hardwood concerns were not in the path of the flood which swept over the city Mar. 25, although several other lumber companies suffered losses. Boats for the rescue of flood victims were built at the plants of the Balke & Krauss Company and the main plant of the Capitol Lumber Company. Lumbermen have donated liberally to the relief fund, among the number being the Balke & Krauss Company, the Interior Hardwood Company, and the Long-Knight Lumber Company, also E. C. Atkins & Co., manufacturers of saws.

MEMPHIS

The Valley Log Loading Company, which operates a log loading plant on the Yazoo & Mississippi Valley line of the Illinois Central System, has been doing everything in its power during the past few days to move the timber placed on the right of way of that railroad. During March it loaded about 1,500 cars for Memphis and other points. It would have been able to deliver more but for the inability of the railroads to furnish the necessary equipment and motive power. The company has been besieged with requests for prompt loading of timber during the past few days because a great deal of this will be overflowed if it is not brought out within the next week. The Yazoo & Mississippi Valley is subject to more or less interruption from the high water and the present indicated stage suggests that after next week it will be impossible to make any headway with logging work for some time. It also suggests the possibility that any timber left in the low lands along that line may be subject to overflow as was the case last year.

Albert N. Thompson & Co. are preparing to erect a mill near Yazoo City, Miss., for the development of the timber on a cypress brake owned near there. This firm has been engaged in the wholesale handling of hardwood lumber here for a number of years. The mill will not be of very large capacity, but it will be a band one and the output will be of the best character. In addition to its general business the firm will market the output of this mill.

W. A. Stark of the W. A. Stark Lumber Company is preparing to erect a mill at Bledsoe, Ark. It is to be a band plant and will have a capacity of about 30,000 feet per day. Mr. Stark has acquired a considerable amount of timber in that immediate section and the new mill will be installed for the development thereof. Mr. Stark was for a number of years associated with his brother, James E. Stark, in the wholesale hardwood lumber business. Later he conducted a wholesale business under the firm name of W. A. Stark Lumber Company. He has been anxious for some time to own and operate a mill and has at last found what he desired in that particular field.

The Grismore-Hyman Company has made application for a charter under the laws of Tennessee. Its headquarters will be at Memphis and its capital stock is placed at \$50,000. Among the incorporators are: F. Grismore, H. W. Hyman and Ray Ulrey, all of whom have been prominently identified with the cooperage trade of this city and section for a number of years. The company will manufacture staves, lumber and other allied products.

The Blytheville Cooperage Company has been chartered at Blytheville, Ark. It is capitalized at \$15,000 and is engaged in the handling of staves, timber and other products. F. P. Carter, T. Slagle and others are the incorporators.

The John Dulweber Company of Cincinnati has broken ground for the establishment of a hardwood mill at Moorehead, Miss. The new plant is to be in operation within the next sixty or ninety days.

The Shelby Cooperage Company, Portland, Ark., has completed arrangements whereby its plant is to be removed from that point to Helena, Ark. This company gives employment to about one hundred men and will be a substantial addition to the manufacturing enterprises of Helena.

E. P. Costello, chief clerk of the office of R. M. Dozier, commercial agent of the Iron Mountain System, is successor to W. M. Taylor, as chief clerk of the Memphis Freight Bureau. Mr. Taylor has gone to Pine Bluff to accept the management of the recently organized freight bureau at that point. The lumbermen of Memphis have been prominently identified with the Memphis Freight Bureau for a number of years and that organization has been of substantial aid to them in the handling of rate problems undertaken by the Lumbermen's Club of Memphis, the old Memphis Hardwood Rate Association, the old Memphis Lumbermen's Traffic Bureau and the present Southern Hardwood Traffic Bureau.

A. H. Egan has already entered upon his duties as general superintendent of the Yazoo & Mississippi Valley Railroad, with offices in Memphis. He succeeds G. W. Berry, who recently resigned and was appointed superintendent of terminals at Chicago. Mr. Berry was quite popular with the lumbermen and the latter have expressed much regret that his wife found it impossible to live in the South, thus making his transfer necessary. Mr. Egan has been extended a very warm welcome by the lumber fraternity as well as by other business interests here.

Russe & Burgess, Inc., have ordered a new mill which is to be delivered within the next sixty days. It is to be equipped with a nine-foot band saw, with shot gun feed, and is also to have a seven-foot Mershon band re-saw. The Allis-Chalmers Company has secured the contract. The firm will begin tearing down its present mill about the first of May and it ought to have the new plant installed and in readiness for operation by Sept. 1. The new mill will have a capacity of 40,000

to 45,000 feet. The present mill is cutting at the rate of about 25,000 to 30,000 feet. The old mill will be completely dismantled and sold. This firm has been engaged in the manufacture of hardwood lumber at Memphis for a number of years and makes a specialty of export business. In fact it maintains an office in London for the handling of its foreign trade. This is in charge of G. A. Farber, who is a member of the firm.

A slight increase is shown in building operations at Memphis for March. The total valuation was \$573,321, against \$499,366 last year, an increase of approximately \$75,000. The outlook is considered good for April. It is not anticipated that the high water will have any effect upon building operations here, although it is likely to decrease activity outside of this city, particularly in the Mississippi valley.

Bank clearings for March broke all previous records in the history of this city for that particular month. There was an increase of approximately \$2,000,000 over the same period last year. The total was \$34,553,173.97. The cotton market during March was not particularly active and the excellence of the showing with respect to bank clearings is due in considerable measure to the good trade enjoyed in some other lines. The lumbermen made a most substantial contribution. They had a better business during March than they have had for several years at this particular time and, but for the flood outlook, the situation would be quite bright from their standpoint.

The Illinois Central and Yazoo & Mississippi Valley roads have advised the Southern Hardwood Traffic Bureau that they will comply with the decision of the Interstate Commerce Commission in the recent transit case and issue tariffs, to become effective about May 1. These will provide a refund on inbound movements of logs to Memphis upon shipment out of lumber, without reference to the kind of logs received or the sort of lumber shipped. This means that it will not be necessary for the lumber manufacturers here to ship gum lumber out of Memphis in order to secure the refund on gum logs shipped to this point. The requirement heretofore has been that the particular kind of lumber designated by the logs had to be shipped in order to release the refund on the logs and this resulted in tying up the funds of lumbermen for an indefinite period. The decision of the companies to handle the matter as already indicated will result in facilitating the refunds and will prove of very great assistance to the lumbermen operating at this point.

NASHVILLE

Additional supplies of logs will be brought down the Cumberland as a result of the high tides. Logging operations in the upper river section have been fairly active and many millions of feet have come to this market.

Unfavorable weather during the recent storm period held back local building operations considerably, but the past several days have been good and spring-like and, with the advent of warm weather, great activity along building lines is confidently anticipated. Reports indicate that this will be a great year in building here, some predicting that 1913 will break all former records. Building statistics for the past month show that Nashville held the lead in the gain for building operations. Reports show that during 1913 there were 1,463 building permits issued here outside of those for minor repairs, the total cost of the work being \$1,388,997. August held the record for the greatest number during the year and December had the record for the smallest number.

Charles E. Hunt, one of the prominent local members of the trade, is recovering from a recent attack of appendicitis.

Several insurance bills of interest to the lumber trade are pending before the Tennessee legislature. One forbids any company doing business in the state except through a resident state agent.

Comparatively little damage was done hereabouts by the recent general storms and floods. All the streams are all out of their banks and this fact has necessarily handicapped for the time being those plants which occupy low lands along the rivers and also makes hauling difficult on the country roads; a considerable amount of standing timber was blown down in spots; but leading local lumbermen say the losses will not be heavy or general. Considering the severity of the storms, the losses are reported remarkably light to the timber and lumber interests of this section.

The Nashville Pattern Works with J. D. Tipple of Youngstown, O., as proprietor and manager, will establish a plant here for making wood patterns for all kinds of castings. Many skilled workmen will be brought here from Youngstown to be employed in the new factory.

The Memphis Freight Bureau has filed a complaint with the Tennessee Railroad Commission here regarding rates on forest products to Memphis from stations on the line of the Nashville, Chattanooga & St. Louis Railway. The claim is that a discrimination is being made against Memphis compared with other Southern cities on the same line for equal distances. The commission here has taken the matter up with the railroad authorities.

F. G. Ewing's sawmill at Adams was destroyed by fire on Apr. 1, the loss being about \$2,000. The fire is supposed to have started from the engine.

LOUISVILLE

The Ohio river, not content with the damage caused in January, where the lumber interests of the valley were subject to inconvenience and loss equaling the flood of 1907, came through with another which in the

volume of water piled up and the extent of the damage wrought, was surpassed but slightly by the record flood of 1884. Lumbermen cannot remember having had to contend with two floods in one year, and consequently the second trouble of this kind coming in 1913 seemed to vindicate the ill omen of the date. The river's rise was rapid as the waters of the swollen streams of Ohio and Indiana as well as those of Kentucky poured into the overburdened channel. The Point was flooded again, and many industries along Beargrass creek were put out of commission by the backwaters of the river. Though the river is now rapidly receding and will be at normal stage in a few days, much remains to be done before the situation can be pronounced normal. Lumber concerns at Maysville and Paducah on the Ohio river, Hickman on the Mississippi, and at many points on the Kentucky river, were damaged by the flood, which invaded plants supposed to be immune. As the result of the widespread devastation, greater attention is now being given to plans for building a dike around the Point in Louisville, and the municipal authorities are arranging for a survey of the situation to be made by Federal engineers.

The worst feature of the situation, from the standpoint of lumbermen not directly affected by the flood, was the paralysis of mail and freight services. The former was the first to recover, though much Chicago, Indianapolis and other northern mail arrived in Louisville ten days overdue. Freight traffic was completely demoralized, and even now few of the roads are able to handle cars with any satisfaction to themselves or their customers. The prospect is for a great tie-up of freight throughout the Middle West, as shippers from all sections are now pushing overdue consignments into that territory, where the railroads are utterly unable to cope with the situation. They have put embargoes on as much as possible, but the moment one is lifted a veritable flood of freight pours in. Hence lumbermen may expect to worry chiefly with this phase of the situation during the next few weeks.

The Louisville Hardwood Club has arranged to resume the series of business papers which were such a pleasant feature of its work last year. Assignments were made by firms, and two representatives of each concern will make talks. G. D. Crain, Jr., secretary of the club, started the series Apr. 8, and the following will appear on the dates named: D. E. Kline, Louisville Veneer Mills, Apr. 15; C. M. Sears, Edward L. Davis Lumber Company, Apr. 22; T. M. Brown, W. P. Brown & Sons Lumber Company, Apr. 29; A. E. Norman, Norman Lumber Company, May 6; Stuart R. Cecil, Booker-Cecil Company, May 13; P. G. Booker, Booker-Cecil Company, May 20; R. F. Smith, Ohio River Saw Mill Company, May 27; Berry Norman, Norman Lumber Company, Jun. 3; Edward S. Shippen, Louisville Point Lumber Company, Jun. 10; H. E. Kline, Louisville Veneer Mills, Jun. 17; Edward L. Davis, Edw. L. Davis Lumber Company, Jun. 24; Ohio River Saw Mill Company, Jul. 1; W. P. Brown & Sons Lumber Company, Jul. 8, and Smith Milton, Louisville Point Lumber Company, Jul. 15.

P. G. Booker has been elected president of the Booker-Cecil Company, which was recently incorporated with \$50,000 capital stock. John Churchill is vice-president and Stuart R. Cecil secretary and treasurer.

W. V. Shepardon, secretary and treasurer of the Anderson Veneer & Saw Mill Company, recently resigned in order to take up the study of osteopathy. He was succeeded by August Kahler, who has been with the company for some time.

A state forestry association will be formed in Louisville during the meeting of the Kentucky Educational Association, which meets Apr. 30.

Local hardwood men are much interested in the announcement that printed copies of the proposed amendments of the rules of the National Hardwood Lumber Association will be issued shortly, so as to enable them to be considered prior to the annual meeting of the association in Chicago. The amendments will be thoroughly discussed in advance of the meeting, so as to enable them to be disposed of at the convention with a minimum amount of trouble.

The Chesapeake & Ohio has contracted for the immediate construction of its 22-mile extension up Beaver creek, and work on it will be begun at once. The cost of the extension will total \$300,000. It will open up an important section of timber country which at present is not equipped with transportation facilities.

Louisville lumbermen are taking a prominent part in the work of the commercial club, which, with the co-operation of other organizations, is raising a fund of \$500,000 for the purpose of assisting new industries to start here. The plan is to take stock in deserving enterprises, this stock to be retired as the companies get on their feet financially.

The American Creosoting Company, which has offices in Louisville, has let contracts for the equipment of two new plants which it is building, one at Indianapolis and the other in Canada. The Louisville & Nashville has also let contracts for the equipment of its \$40,000 creosoting station at Guthrie, Ky.

◀ ST. LOUIS ▶

The receipts of lumber by rail at this center, during the month of March this year, as reported by the St. Louis Merchants Exchange, were 11,746 cars. During March last year the receipts were 13,769 cars, thus showing a loss in receipts this March of 2,023 cars. This falling off was due to the weather conditions. Shipments of lumber by rail last month were 12,650 cars while a year ago the shipments were 9,879 cars, a gain over the corresponding month last year of 2,771 cars.

There were no receipts or shipments made by river either this year or last.

F. H. Smith, president of the Lumbermen's Exchange of St. Louis and also president of the Smith-Sneme Lumber Company, was the principal speaker at the monthly banquet and business meeting of the St. Louis Furniture Board of Trade, held a couple of weeks ago. The topic of his talks was Lumber Inspection.

The most radical measure ever introduced in the Lumbermen's Exchange was adopted at its last meeting. This was the enlargement of the character and scope of the exchange by making it the nucleus of a national inspection organization for concerns not affiliated with the Yellow Pine Manufacturers' Association, by taking into the organization and giving them the benefit of inspection, a number of wholesale yellow pine concerns who were excluded from membership in the Yellow Pine Manufacturers' Association recently. The idea was conceived by President Smith of the exchange. A committee is at work formulating plans, which will be announced later. Already a number of out-of-town yellow pine wholesalers and hardwood manufacturers have joined or have signified their intention to do so at the proper time. It is the intention of the exchange to furnish these firms with an inspector, not only in St. Louis, but an inspector who will be subject to their requests to do out-of-town work.

The inspector of the Lumbermen's Exchange, E. L. Watkins, whose family still resides in Anderson, Ind., received a wire from them a few days ago that the household effects which had been packed, preparatory to being moved to St. Louis, where Mr. Watkins intends to reside in the future, had all been swept away by the flood. He is now over there looking after them.

Advices have been received here that the Interstate Commerce Commission has further suspended advances in hardwood rates from Memphis to New Orleans until Sept. 30.

R. F. Krebs of the Krebs-Scheve Lumber Company and Miss Gertrude Nepper were married here on Mar. 29. They will be at home after Apr. 14.

President T. C. Whitmarsh of the Lumbermen's Club has named W. E. Grayson, president of the Grayson-McLeod Lumber Company, as vice-chairman of the traffic committee of the club to assist Thos. E. Powe of the Thos. E. Powe Lumber Company in his duties. These two gentlemen, with E. E. Eversull, traffic manager of the W. T. Ferguson Lumber Company, and George Reeves, traffic manager of the Chicago Lumber & Coal Company, two well known traffic experts, as the two other members of the committee. These appointments were made because the traffic matters of the club are growing since this has been made one of the features of the organization and it promises to grow more in importance before the year ends. All traffic matters which may come before the club from time to time will be handled by this committee. The personnel of the committee is a very strong one, probably the strongest on traffic matters of any lumber club in the country.

The lumber fraternity of this city did their share in subscribing to the Ohio and Indiana flood fund. The Lumbermen's Club and the Lumber Dealers' Association joined forces and sent out an appeal to their members who responded liberally and quickly. The committees were made up of J. A. Reheis, Julius Seidel and Stephen H. Gavin of the Lumber Dealers' Association, and W. E. Barns, C. M. Jennings and T. C. Whitmarsh of the Lumbermen's Club. The subscriptions amounted to nearly \$700, in spite of the fact that many of the members of the two organizations sent in subscriptions direct to the Red Cross Society before the joint appeal was received. The Lumbermen's Exchange did likewise and responses came in quickly from them.

◀ MILWAUKEE ▶

The Burdick Cabinet Company, recently noted as having incorporated with a capital stock of \$150,000 at Milton, has purchased a factory site and building operations will begin at once. At a recent stockholders' meeting, the following directors were elected: Fred F. Burdick, president; Dr. A. S. Maxson, vice-president; Allan B. West, secretary; B. H. Wells, treasurer; Dr. G. E. Crosby and George W. Coon.

Among the new manufacturing plants to begin operations in Tomahawk during the past two weeks is the Tomahawk Stave and Heading Company. The plant has been equipped and work has been started.

An annex 108 feet long and 64 feet wide has been completed at the plant of the Marinette & Menominee Box Company, at Marinette. It has been equipped with three bolting machines and a sawdust and bark conveyor. Twenty additional men are given employment in the new department of the factory.

The Haslam Lake Timber and Logging Company has been incorporated at Janesville, with a capital stock of \$300,000. O. E. Oestreich, L. A. Avery and L. Westlake are named as incorporators. The same principals have also incorporated the Gordon-Pasha Timber Company of Janesville, with a capital stock of \$100,000.

An amendment of the incorporation articles of the Oscar A. Anderson Lumber Company of Janesville, has been filed. The capital stock is increased from \$30,000 to \$50,000.

The Superior Lumber Company has been incorporated at Superior by Harris W. Erlanson, C. L. Erlanson, G. M. McFarlin and Eva G. Erlanson. The capital stock of the concern is placed at \$10,000.

The Bradley Estate Company has been incorporated with a capital stock of \$25,000, divided in 260 shares of \$100 each. Miss Alice Bradley,

Edna Bradley, daughters of the late Edward Bradley, pioneer lumberman, and Spencer Hilsley are the incorporators.

With newly acquired timber holdings, on which are about 600,000,000 feet of standing timber, which were turned over on Apr. 1, the Hines Lumber Company will soon start its sawmill at Park Falls. About 1,500 men will be employed at the mill and in the woods, and with a 10-hour day run, the mill will saw between 175,000 and 200,000 feet daily. The present intention is to run steadily on day shifts and during eleven months of the year. The timber will furnish a ten years' supply.

The J. W. Wells Lumber Company has acquired ten forties of timberland on the Wisconsin Northern railway from the Sawyer-Goodman Company of Marinette through a deal whereby the latter concern secures scattered timber in the vicinity of Goodman. The Wells company will lay about two miles of spur track into the newly acquired timber and log it during the coming summer, according to Superintendent W. E. Hallenbeck.

The Van's Harbor Land and Lumber Company of Van's Harbor, Mich.,

has closed a deal whereby it comes into possession of a large tract of timbered land in Iron county, Wis. The deal was consummated through the Grimmer Land Company of Marinette for lower Michigan parties. The Van's Harbor company will move its mill from Van's Harbor to Iron county this year.

The Roddis Lumber & Veneer Company of Marshfield has increased its timberland holdings by 2,862 acres of timberland in Iron county. The company now has 28,000 acres in Ashland and Iron counties which will supply raw material for many years. The timber suitable for veneer is shipped to the Marshfield factory, while the remainder is sent to Park Falls to be sawed into lumber.

The Keith & Hiles Lumber Company of Crandon has closed a deal with the Chicago & Northwestern railway for the purchase of 3,000 acres of fine hardwood timberland, lying south of Crandon and close to their logging railway. This makes a total of 6,000 acres acquired during the year.

Charles F. Kade, general manager and vice-president of the M. Winter Lumber Company of Sheboygan, has resigned. He disposed of his stock early last summer and at that time resigned, although the resignation did not take effect until the last of March. Mr. Kade has been with the company for sixteen years and will take a much needed rest before entering some other business.

The Peshtigo Lumber Company, Peshtigo, Wis., will in a few days open its new, modern sawmill, equipped with the best machinery, which replaces the one destroyed last year. With the exception of the carriage and "nigger" and the band re-saw, all machinery is ready and connected up. The shingle and tie mill, to be operated with the sawmill, is nearing completion, and the filing room is almost ready. The new brick power house is a 52 by 60 foot structure, with a fuel room 22 feet square and a pump room 16 by 24 feet. A 130 foot smoke stack is being completed, and other equipment ready to start.

The State Railway Commission is investigating the complaint of lumbermen of the state against the advance in the cost of transporting logs. The commodity rates, for handling lumber products, in effect when the railway commission law went into effect eight years ago, were for the most part on logs which were to be manufactured into lumber or some other products and shipped again in the manufactured form. These rates involved discrimination which the new law expressly forbade, and the readjustment made the rates uniform and common although not up to the plane of other rates. Now that the railways have been advancing these log-handling rates, more nearly to the level of other traffic, the lumbermen have complained. It is possible that the commission may advance them still further.

Lyman Oliver Rumery, a resident of Oshkosh since 1854 and one of the last of the lumbermen of the old school, has passed away at his home in that city, aged nearly eighty-six years. Mr. Rumery was a native of Maine and came to this state nearly sixty years ago with his wife, since deceased. He was one of the first to engage in the logging business, a part of the time with others and at times independently. He is survived by two sons and five daughters: J. P. Rumery of Chicago; L. O. Rumery, Jr., Miss Carrie Rumery, Mrs. Charles A. Wakeman, all of Oshkosh; Mrs. J. Howard Clement and Mrs. Francis S. Underwood, both of Milwaukee, and Mrs. Lewis H. Gunnell of Arlington, N. J.

< DETROIT >

The Thomas Forman Company reports that business is continuing along the same lines and that the mill force is working full time. "Our supply of rough material is getting low due to the floods of a year ago," said a representative of the firm. "The crippled condition of the railroads in Ohio and Kentucky is by no means a pleasing situation for us. While we have a fairly good supply of dressed lumber on hand, it is feared that with the spring rush we will be too handicapped to supply the trade as readily as we would like to."

Mr. Forman is on his way to the company's mills in Heidelberg, Ky., to rush the rough material to Detroit as speedily as possible. The high wind of last week caused some damage to the company's plant, not only to the lumber piles but to the mill as well. A part of the roof of the mill was blown off and some stock was damaged.

George I. McClure reports that business is brisk in all lines of hardwood and that prices are high and firm. Mr. McClure says that the auto body companies are starting to buy more freely, after a lull of about three months. The furniture factories are also placing nice-sized orders for immediate delivery. Business in the building trade is increasing every day.

On account of the increase in the building trade Geo. I. McClure is building a new warehouse 100x40 feet, thereby increasing facilities for carrying more stock. The M. C. R. R. will next week lay another track into the yard. All tracks are 600 feet long and paved for teaming.

E. W. Leech reports that business is a little quiet in the hardwood line and that stock is a little scarce. Prices on all materials are reported firm. "We have done more business this winter than we did last and prospects for an early spring rush are very good," says Manager Smith. "The auto body companies and the furniture factories are ordering freely for immediate delivery and the box companies are beginning to show signs of renewed activity. There is a good demand for crating lumber from this source. Building permits issued this winter are largely in excess of last winter and I look for a big business in lu-

terior foish within another week. Like all other hardwood men we are eagerly awaiting the opening of navigation to replenish our stocks as the difference in freight rates by boat and rail is no small matter."

R. J. Clark, president of the Peninsula Park & Lumber Company of Saulte Ste. Marie, Mich., was in Detroit the past week on business.

A. E. D. Allan of the firm of Allan Brothers who is ill with inflammatory rheumatism and who went to St. Petersburg, Fla., a couple of weeks ago is slowly regaining his health, according to letters received by his brother, Bert Allan. Mr. Allan has been ill for several weeks and because of his condition his southern trip was delayed some time.

Bert Allan of Allan Brothers reports that, because of the floods in Ohio, Indiana, Kentucky and other southern points, shipments of hardwood lumber from the South have been seriously hampered.

Albert B. Lowrie and Fred J. Robinson of the Lowrie & Robinson Lumber Company, have just returned from a vacation spent in Los Angeles, Cal.

John J. Comerford of the Detroit Lumber Company has returned from a trip to Panama where he spent several weeks.

Mr. Clancy of the Thornton-Clancy Lumber Company of Chicago, was a visitor last week.

The Hardwood Market

CHICAGO

Considerable anxiety is being experienced by members of the local trade in the matter of making deliveries on southern stock originating in the flooded territory. Quite a quantity of lumber was shipped from distributing centers along the Ohio before the floods actually reached there, in anticipation of high waters. This stock was loaded hurriedly and was practically dumped onto the market in more or less of a chaotic condition. There was not enough of it to effect any very marked change in market conditions, but several shrewd purchasers were willing to take a chance and realized very handsomely on it.

The spring season is evidently here to stay, although there is still a little chilliness in the air. Still definite arrangements are being made locally for the active opening up of the building season. Any complaint that comes regarding the laxity of business from any quarter is but reasonable.

As a whole the main difficulty is in securing enough dry lumber to actually take care of the demands of the consuming trade. Those operating in both northern and southern stock are necessarily doing more in northern woods and are in many instances arranging to ship stock which is not as dry as it should be, because they are not able to wait until such lumber comes in in first-class shipping condition.

On the whole the consensus of opinion of the local trade would indicate a very favorable showing for the coming spring months.

NEW YORK

The lumber market of New York and vicinity has shown some recent changes which may be taken as an indication of what the market will be throughout the spring season. So far as the volume is concerned no great change has taken place, although there has been a slight increase. The price situation is a different matter and the entire list is on a higher range than for the past few years, which is taken as an indication of strong prices for the season. Recent advances are shown in ash, oak, maple, basswood and birch. The better grades of basswood are up \$1, ash strips advanced \$2, and thick birch went up \$2. Oak flooring is firm at high prices and maple flooring has advanced \$3 on the clear grades. There is nothing to indicate a falling off in values, but it is evident that some buyers have held off, hoping for a break. The recent floods in the Middle West and the conditions prevailing at manufacturing points argue for a continued high range of values for some time to come.

BOSTON

There is fully as much strength displayed in the market for hardwood lumber as there has been and in some cases dealers refer to conditions as firmer, if anything. There has seldom been a time when manufacturers of hardwood lumber have been as independent as they are at the present time. Dealers in this market state that offerings are not large and very few cases are found where the holders showed any anxiety to force sales. Manufacturers in the market using large quantities of hardwood lumber during the year are found to be carrying rather small stocks as compared with past seasons.

At the present time several of the large cutting up plants are a little quiet. Others, however, are keeping plants operating to full capacity. Veneers are in fairly active demand at the present time and prices are well maintained. There is a very strong demand for plain oak and prices are firmer and higher than they have ever been. Quartered oak is not in as good demand as plain oak, but there is quite a good deal more being used than six months ago and the outlook is that buyers will want still larger lots. Chestnut is in very fair call at firm prices. Cypress

has attracted a moderate volume of new business. For maple demand is fair and prices are very well held.

PITTSBURGH

If the tri-state territory had not been so thoroughly washed up and flooded during the past ten days the hardwood business would be regarded as first-class. Demand from factory consumers is getting somewhat better. The tendency is to pay the prices asked with comparatively little kicking. Hardwood mills, however, are badly swamped, railroads which handle their stuff are out of commission and many yards which carry a large stock of hardwood have had their lumber washed away or are pretty nearly out of business for a week or two. It is certain that there will be a big demand for hardwood lumber for construction and repair contracts on railroads and in manufacturing plants throughout the flooded district and this trade is sure to come forward toward fall.

Kraetzer-cure LUMBER

Hardwood men in general regard the outlook as very promising with the exception of the delayed shipments which are sure to be reported in the near future.

< BUFFALO >

The hardwood trade has been very fair during the past month, the main difficulty having been the getting hold of stock. Buffalo has been very well favored in not having any flooded conditions to affect its hardwood yards, and for this reason is well supplied with dry stocks in the various woods most wanted. Dealers believe that this will insure good business here during the next month or two. Already the unfortunate conditions prevailing elsewhere have resulted in turning more attention than usual to the stocks held by the Buffalo dealers.

Trade has been best in the same woods as have been active for some time, including plain oak, ash, birch and maple. All are very firm in price. Furniture manufacturers as a rule are busy, and as they have not bought largely present conditions in the flooded districts are expected to lead to larger buying from the furniture factories within a short time. Activity is also likely to be quite marked in the building line this spring, as plans have been made for a good deal of construction work.

< PHILADELPHIA >

There has been no change of any magnitude in the hardwood situation since last report. A fair volume of new business is coming in and values are well sustained. Consuming industries continue fairly busy, but buying proceeds on a conservative basis as many buyers believe there is still the probability of a break in prices; although apparently there is no sign to justify such a prediction for the near future at least. On the contrary, weather conditions in some of the southern and middle west logging sections can interfere to a considerable extent with the manufacturing of lumber. The wise wholesaler is not losing time in wasteful forebodings, but is securing himself wherever an opportunity permits of closing a deal for standard stock. Building work of the operation class has not advanced as rapidly as expected owing to a fear that as the legitimate winter months had been so mild, there would be a lap-over of cold weather into spring. At the first sign of settled weather this branch of business will proceed with vigor. There has been no suspension of the general construction work during the winter.

There is some fear of a possible forcing of values on plain oak to a prohibitive height, which will necessitate a search for substitutes. The stock of oak continues scarce, and the tendency is upward in price; quartered oak is still strengthening; ash is making new friends; sound wormy chestnut is advancing, and inquiries multiply; high-grade chestnut, although not keeping pace with some of the other woods, holds firm; poplar unweakened; birch and beech are in good call. The veneer and mahogany markets maintain good reputation. All low grades are pretty well sold up.

< BALTIMORE >

Whatever may be said of other divisions of the lumber trade, hardwoods are not only holding their own, but the advance in prices seems to continue and there are good reasons for assuming that the highest figures have not yet been reached. One of the matters that are receiving consideration now is the possible effect of the floods and cyclones in the Middle West. There can be no doubt that great quantities of lumber will be required to repair the damage done, which can hardly fail to cause such a heavy drain upon the sources of supply as to send values to still higher figures. As it is, the range of the quotations is very firm, with stock so small that dealers are unable to provide adequately for their needs. Inquiry at the mills elicits the information that generally the producers have no extensive stock to draw upon. In various divisions of the trade the manufacturers are entirely sold out, while the demand keeps up and the search for lumber goes on. Even with the production at its maximum now, some time must elapse before any marked impression could be made upon the situation. For the present the inquiry appears to run ahead of the output; at any rate, practically all the members of the trade could dispose of large quantities of lumber if they were obtainable. Both the millmen and the wholesalers are confronted by the difficulties of the situation, which are in the main that no one can tell exactly what lumber is really worth. If the wholesaler takes an order without having the stocks needed to fill it, he may easily find himself in the position of having to go on a diligent hunt and pay more than he gets. Great care and caution are necessary now to avoid actual losses.

Even extra wide poplar is coming into its own once more, a marked improvement in prices having taken place. Poplar men find an explanation for this in the reports that the automobile builders are going back to wood for bodies in place of the sheet steel which they have been using. They have found by experience that wood makes a more elastic construction, is lighter and does not rattle, which is the case with the steel bodies. Especially in the higher grade cars there is said to be a noticeable tendency to go back to wood as having various important advantages over metal. Oak is higher than ever, with prices evidently still going upward, and the foreign markets not at all congested, although the export movement has been quite heavy of late and seems to be on the increase. Sound wormy chestnut is still finding ready takers; in fact,

the demand, if anything, is more active. Other grades of chestnut are likewise firm or higher, and all of the other hardwoods are not far behind. The lower grades of poplar are comparatively quiet, with prices perhaps a shade easier than was the case some time ago; but the prospects are that the entire list will continue strong and that the demand will suffice to absorb promptly any quantity of lumber which the mills can turn out.

◀ COLUMBUS ▶

The general condition of the market outside of flood conditions is about the same as the previous fortnight. There is a good demand for all grades and varieties of hardwoods, especially oak and chestnut. Plain and quartered oak are selling well and stocks are growing scarce. Both red and white oak are selling well. Chestnut is another strong point in the market and all grades are in demand, especially sound wormy.

Walnut is becoming more active and the same is true of ash. There is also a better demand for poplar and prices are ruling strong. Stocks in poplar are not as large as formerly. It is still too early to foretell the effects of the flood on the hardwood trade, although it is believed the rebuilding of hundreds of houses will stimulate the trade in many ways.

◀ CINCINNATI ▶

Up to last week when the heavy rains set in all over this section, demand for all hardwoods was fine and what mail has been received from distant points out of the flood zone still shows a strong demand. Local business on account of floods for miles around is suspended and it will be a couple of weeks before much can be expected in the hardwood line of trade in shipments, except that which comes direct from mill points in the South not affected by the water that is rapidly rising in some southern points. There is no change in prices noted on any items and most hardwoods are hard to obtain in dry stocks and manufacturers claim that green stock now on sticks is pretty well sold ahead. The prospects for a big year in hardwoods never were better and dealers are looking forward to better business this year than last.

The low grades of poplar are scarce and high in price and the improvement noted in the No. 1 common and better grades is very encouraging to dealers. Prices are firm and the scarcity of the low grades is growing, the box factories taking all stock of this class readily.

While the weather is good and favorable to building on the hilltops, the between season period is on and consequently demand for material is very light. All local planing mills are very busy and have been all winter working on stock sizes, a large quantity of which will be necessary to take care of the heavy building business that is anticipated. Much stock of this kind is being accumulated. Dealers also have bought heavily of this class of stock and will likely have to buy much more, as the building season will open up at any time now. Prices are likely to be higher than last year, due to the increased cost of most all kinds of rough lumber suitable for millwork.

◀ TOLEDO ▶

Hardwood lumber has been scarce here for months past and great difficulty has been experienced in securing a sufficient supply of dry stock in wanted materials. The mills seem to have no surplus stock on hand and indeed in some sections the stock is being sold clear up to the saw. This augurs ill for the securing of supplies, the necessity for which could not have been foreseen. Retail dealers too have been backward about buying, having taken only such stocks as they need for immediate use, fearing to indulge in speculative buying of any sort. The local yards in consequence are not specially well filled and the unusual demands which will be made upon them within the next few weeks is likely to prove a source of no small embarrassment. Just what the outcome will be remains to be seen, but it is safe to assume it will not tend towards weakening the prices which remain firm in all lines.

◀ INDIANAPOLIS ▶

The hardwood lumber trade in Indianapolis and vicinity has been practically at a standstill for the last two weeks. Owing to crippled transportation and mail facilities, it has been impossible to transact much business. Very few hardwood shipments are moving in or out.

It is said the outlook for the hardwood trade, after conditions have righted themselves—which will be in two or three weeks—is very encouraging. Manufacturing concerns throughout the state using hardwoods have suffered heavy losses to their plants and in some instances their hardwood stocks have been washed away.

There has been no change in hardwood prices recently. There is still a marked scarcity in one-inch oak.

◀ MEMPHIS ▶

The demand for hardwood lumber here continues good but the outlook is not quite so favorable from the standpoint of production, owing to the flood in the Mississippi, which promises to be one of the most serious in the history of this territory. Some of the manufacturing plants at Memphis have already found it necessary to close down and, whether the levees hold or not, there is certain to be a great many mills which will

The Record

When northern pine forests ceased to yield lumber sufficient to supply commercial needs, production of northern hemlock and of southern pine and the value of both kinds of timber increased rapidly. A broader demand was created for it.

The crest of southern pine production has been passed. From the top record of 16,277,185,000 feet in 1909 the cut dropped to 12,896,706,000 feet in 1911. A further decrease of at least 25 per cent will be shown in the next ten years.

To make good this deficit in the supply production of western lumber will have to be increased at least 60 per cent. That will bring about a rapid increase in the demand for and value of western timber.

This is an inevitable FACT
Are YOU preparing to profit by it?

find it impossible to operate during the prevalence of the present high stage of the Mississippi. This view of the situation is causing somewhat increased firmness on the part of holders of hardwood lumber. The flood is restricting logging operations and the handling of timber and is also an influence in that respect because tending to reduce the amount of logs available for the mills.

Plain oak is a very ready seller in all grades and is bringing full prices. There is also strong demand for the lower grades of cottonwood and gum which are being used largely in box manufacturing plants. The supply of neither is large enough for requirements, with the result that prices are somewhat in favor of the seller. The movement of ash is moderately large. Those who have thick stock to sell are meeting with no difficulty in disposing thereof. There is a fairly good demand for quartered oak and prices are about the same as recently. Cypress is moving in considerable volume but prices are not more than holding their own. Export business continues quite satisfactory.

< NASHVILLE >

Good lumber is at a premium, for dry stocks continue light and prices, therefore, are still high. No considerable damage resulted from the recent floods and storms, although more or less timber was destroyed and the high waters somewhat interfered with the operations of mills on the river banks and with the hauling over rural roads. The amount of rebuilding which will necessarily follow the storm damage will naturally benefit the lumber trade, both wholesale and retail, considerably.

As to the business done on the local hardwood market, it continues about on a par with that of several weeks past, although the situation seems satisfactory to the members of the trade. Plain oak is still leading in the demands and quartered oak is now not far behind it. Ash, chestnut, hickory and cottonwood are holding their own; gum is slightly off; elm, basswood and poplar are about stationary; cypress is steady.

There is a steady volume of business at good prices. The retail trade is improving as the weather settles for spring. Box, sash and door makers report improved business and all other consuming plants are busy. Mill stocks of the lower grades are very low and this increases calls for upper grades. Several buyers from other cities have recently been here. High tides on the Cumberland river will bring large log shipments to Nashville. Many millions of feet have already come this season. The prediction is that 1913 will break the record here for building operations.

< LOUISVILLE >

Louisville is rapidly recovering from the effects of the second flood of the year, and those concerns which were compelled to fight the high waters directly have seen with relief the rapid ebb of the river from its record stage, while others realize that the delays and interruptions to which their business had been subjected by reason of broken postal and transportation facilities are rapidly disappearing. It is believed that another week will find matters close to normal, with business moving on as usual. It is believed that the flood will not have a serious effect on business, as fundamental conditions remain good. The demand is continuing, and lumber will be needed just as before, with perhaps a slight incidental increase due to the demand for construction purposes on the part of the railroads and others. Consequently the sentiment is optimistic all around. Prices are steady, with plain oak continuing to hold the pace both as to sales and price. Quartered oak is also in good demand, with ash showing continued strength. Poplar is moving somewhat better. Cottonwood is also in demand. The remainder of the month will be of value as indicating prospects for the next quarter. If trade holds up, in spite of disadvantageous conditions which have been created, it may safely be assumed that things are on a sound and substantial basis, auguring a good year for 1913 at large.

< ST. LOUIS >

The local hardwood situation is fairly good and to a certain extent is satisfactory to the majority of the hardwood lumbermen. Quite a nice volume of business is being done, with nearly every item on the list being in demand. Dry plain white oak is very scarce and in order to hurry shipments of this item to their customers, lumbermen are utilizing the dry-kilns of the planing mills and sash and door factories to dry green wood for quick shipments. Quartered oak, gum, and cottonwood are having a steady movement and the demand for poplar is increasing. Ash is also having a good sale. Owing to the scarcity of these items in the producing territory in the South, where it is almost an impossibility to obtain dry stocks, and on account of the increasing rains and floods, the situation is getting still more acute. A good price is obtained for these items and dealers having any on hand find it possible to obtain almost any reasonable prices. There is also considerable strength shown in sap gum, the lower grades of this item being in very good request. Red gum is also being called for quite freely. Cypress continues to be a good seller and considerable is going out at quite good prices. Stocks, however, are running low, owing to delays in inbound shipments. The prospects are very bright for a good lively trade not later than the middle of the month, as building operations are likely to start at almost any time, now that the weather is becoming seasonable.

◀ MILWAUKEE ▶

Wholesalers say that the shortage of most lines of northern hardwoods is resulting in a stronger demand for oak, but shipments of both plain and quartered grades are so light that the supply of oak is far from being equal to requirements. Prices which are being demanded by the southern mills seem rather stiff to local buyers, but they are paid in most instances. Hardwood flooring manufacturers say that there is a real shortage of flooring material. Birch is scarce, as usual; in fact the supply of dry high-grade stuff is practically exhausted. The supply of basswood is decreasing, as a result of the stronger demand from the box manufacturers.

The furniture plants here and about the state seem to be busy and wholesalers say that they have been placing some good orders in this field. The implement factories are not buying quite so much material at this time, owing to the fact that they have passed their busiest season. The sash and door concerns are placing their orders more freely, evidently preparing for the rush of the spring building season.

Logging operations in northern Wisconsin are now at an end, owing to the warm weather. Most of the logging concerns were fortunate in being able to get most of their logs skidded and to the shipping points before the close of the season. Although the season closed earlier than usual, it is said that the total log output will be considerably larger than that of the previous year.

◀ DETROIT ▶

Conditions in the Detroit hardwood market are generally satisfactory. Prices are high and firm. Hardwood stocks are reported fairly plentiful with the exception of thick ash, and the price on this material has increased from \$2 to \$6 per M. Dealers are optimistic for spring trade and a large demand for interior finish is predicted, due to the large amount of building which is already under way. The flooring trade remains in a flourishing condition with orders and inquiries plentiful. The veneer trade is in very good condition while the box factories show renewed activity with large orders for crating lumber.

◀ GLASGOW ▶

The business passing in this section continues on moderately active lines, a fairly steady movement into consumption taking place while a good all-round inquiry is in evidence. If evidence were needed of the enormous inconvenience caused by the recent prolonged carters' strike, it is to be found in the present appearance of the docks. Although enormous quantities of timber of all kinds have been removed within the past few weeks, the cartage facilities available have proved totally inadequate to cope with the situation. In some cases goods sold two months ago are only now being removed. It has been a sickening affair from the timber trade point of view and more annoying still because that had nothing to do with the dispute. Naturally a lull occurred in buying and it is only to be hoped that a greater activity will now evince itself during the remainder of the year and that the past strike will not be a precursor of more to follow. The present high prices of course affect the situation to a certain extent, though it is not expected that any decrease will take place and just as likely that no appreciable advance will occur. No doubt some woods such as Canadian yellow pine will probably increase from year to year, but in the case of such woods as spruce and pitch pine, where freights play an important part, it is entirely different.

It is said that never before has such a poor season been experienced by Quebec shippers who are on their yearly visit. Small or no contracts are reported, due to the limited stocks shippers have available and to a larger extent to the high prices being quoted. Most buyers are at present taking stock and naturally are disinclined to increase their holdings except for immediate requirements. The spot business in pitch pine is rather quiet meantime, and little C. I. F. selling is being done. The stock held is considerable and, such being the case, buyers are somewhat reluctant to face the present high C. I. F. quotations, believing they may be able to do better later on. Advices from the other side as well as recent freight fixtures all point to decreasing freights and shippers with high freight in hand are anxious to push sales as quickly as possible. Buyers, seeing this, are of course not inclined to be pushed. At all events, freights will certainly have fallen by May or June.

Recent arrivals include chiefly spruce deals and birch logs. Of the latter, there has been a considerable import, chiefly round logs on contract. The spruce deals have sold well, but prices are not yet up to shippers' ideas. Two cargoes of American hardwoods have arrived within three days of one another—viz., SS "Indraui" from Baltimore and SS "Kastalia" from Baltimore and Newport News. Both of these shipments practically consist of oak planks and poplar, a few walnut and oak logs, and a few hundred hickory logs. The oak is chiefly on contract for the various railway companies and the hickory logs are mostly on contracts made to various buyers some months ago. One of the large railway companies of Glasgow has just fixed its supply of oak scantlings with the various merchants throughout the city. The Clyde timber brokers stock lists will be issued in a few days and there is no doubt that a pronounced all-round shrinkage will be revealed.

Foreign and Domestic Cabinet Woods in Lumber or Veneers

No order is too big—no order too little—to secure our painstaking attention, and prompt service.

MISCELLANEOUS

WANTED—HARDWOOD LUMBERMEN—

to try the Gibson Tally Book. The three-throw aluminum tally ticket cover accommodates any form of ticket desired. The use of the special triplicate tally ticket supplied, printed on waterproof paper with carbon backs makes tallies unalterable. For durability, convenience, accuracy and for systematizing the inspection of lumber the Gibson tally method can't be beat.

Special forms of tally tickets mailed on application. Covers sold on approval to responsible concerns.

HARDWOOD RECORD,
 537 So. Dearborn St., Chicago.

NOTICE

All persons are hereby warned against accepting or giving credit on account of any guarantees or letters of credit purporting to have been signed and given by J. G. Calvert or J. G. Calvert, vice-president of the National Bank of Jersey Shore, Jersey Shore, Pa., as proceedings in lunacy are now pending against the said J. G. Calvert, in the Court of Common Pleas of Lycoming County, Pennsylvania, to Number 57, June term, 1913. MRS. JOSEPHINE S. CALVERT.

Westinghouse Motors form the Reliable Drive for Wood-Working Plants

AFTER Westinghouse motors are properly installed in a wood-working plant, the only attention they require is an occasional cleaning, inspection and lubrication. Beyond this, there is nothing to be done.

They are ready to start any moment they are wanted and they keep the machines they drive in continuous operation until the power is shut off. They are very rarely out of commission for repairs. Their life is very long; some of the first Westinghouse motors are still in successful operation.

Such reliability is the result of long experience in design, thorough study of operating conditions, and great care in manufacture. These factors combine to make Westinghouse motors more reliable than the service conditions, for which they are intended, require.

Of course, like any other machines, these motors must be properly installed. Westinghouse service takes care of this detail by giving full information on the installation of Westinghouse motors in any plant.

To receive full assurance of motor reliability, specify "Westinghouse Motors."

CLYDE IRON WORKS

Home Office and Factory, DULUTH, MINN.

Baldwin Geared Locomotive

Logging Locomotives must operate on steep grades, sharp curves and uneven tracks. This is what the geared locomotive illustrated has been designed to do. It is symmetrical in construction, and power is transmitted to the axles through a central drive. The valve motion is simple and accessible, and all new features have been tried out in service.

This locomotive is well-designed, well-built and fully guaranteed. Various sizes can be furnished, to suit different track and operating conditions.

SIMONDS SAWS

This illustration suggests just four of the kinds of Saws which may interest you. Our factories manufacture every kind of a Saw used around a wood-working plant or sawmill.

Our aim has always been to supply Saws and Wood-working Machine Knives that will give the maximum service and at the same time do the finest kind of work with the least amount of care. Obtaining these results is the work of experience—and we have been doing it eighty years.

VENEERS AND PANELS

Ahnapee Veneer & Seating Co.

HOME OFFICE, FACTORY AND VENEER MILL, ALGOMA, WIS.
 VENEER AND SAWMILL, BIRCHWOOD, WIS.

We manufacture at our Birchwood plant single ply veneers of all native northern woods and deliver stock that is in shape to glue.

From our Algoma factory, where we have specialized for twenty years, we produce panels of all sizes, flat or bent to shape, in all woods, notably in Mahogany and Quarter-Sawed Oak.

We make no two-ply stock, and do not employ sliced cut quartered oak. Our quartered oak panels are all from sawed veneer.

Every pound of glue we use is guaranteed hide stock. We do not use retainers. Our gluing forms are put under powerful screws and left until the glue has thoroughly set.

If you seek a guaranteed product that is the best, based on results accomplished by most painstaking attention and study of every detail, combined with the use of the best stock and an up-to-date equipment, our product will appeal to you.

If you are a "price buyer" we probably cannot interest you.

ON

Foreign Fancy Woods, Mahogany, Cedar, Circassian

We receive the logs, store or warehouse them, manufacture them into lumber, cut or saw veneers, pile and store the product, and ship via any railroad. Also furnish inspection returns on logs or lumber. Can furnish accommodations and economies which it is impossible to secure elsewhere. We always have on our yards parcels of plain and figured African, Mexican and Cuban Mahogany, Circassian Walnut and Cedar logs, placed here for sale by direct foreign shippers, from which advantageous purchases can be made.

Dependable Joints At a Great Saving

WITH dry lumber, good glue, the very finest quartered oak, mahogany, or any other kind of tops can be made automatically at one operation with a tapered wedge dovetail glue joint without any doubt as to its holding up with any kind of stain or finish. The Tapered Wedge Joint has proven to be as perfect a joint as can be made by any method; it is stronger than other joints because it has 20% more wood surface and the clamping pressure is evenly distributed along the entire length of the jointed edge.

These facts, based on the results of jointing lumber automatically at one operation on the

Does Not See How Any Furniture Factory Can Get Along Without It

STANDARD RED CEDAR CHEST CO. INC.
Altavista, Va., Oct. 28, 1912.

Linderman Machine Co.,
Muskegon, Mich.

Gentlemen:—We are in receipt of your inquiry of the 26th instant and beg to note what you say concerning the "Linderman" machine we bought of you, and in reply would state that since we started this machine up over two months ago, it has been giving us excellent service and we would not be without it for any amount of money, as in the first place, we could not get out the grade of chests that we are getting out, and we do not see how any furniture concern can get along without one of these machines. It is undoubtedly one of the simplest machines to do the work that it does that we have ever seen and we think that it is one of the best built machines manufactured in this country today, and from the looks and action of this machine we do not contemplate any trouble whatsoever with it and have decided to install another in the very near future. We beg to remain,

Yours very truly,

STANDARD RED CEDAR CHEST CO.,
By E. H. Lane, V-Pres. and Gen. Mgr.

Linderman Automatic Dovetail Glue Jointer

which means a reduction in cost of as much as 50 to 70% of the labor bills, 40 to 70% saving in glue bills, the saving of considerable ripping by jointing rough edge lumber without saw kerf and edge waste and then sizing the panel to width without the waste in sizing, are a saving that is patent to every furniture manufacturer.

The jointing of lumber automatically at one operation instead of several operations marks a new achievement in the jointing of lumber and is proving of great value in the building of furniture.

EASTERN REPRESENTATIVE, John L. Cochran
601 W. 115th Street, New York City

YOU pay a *little* more for our hardwood lumber than you do for many others',
but it's worth *much* more.

With our modern and first-class equipment and expert operatives, we couldn't make bad lumber if we tried to, because the *quality* and *size* of our virgin tough mountain white ash, red birch, yellow poplar, buckeye, maple, red oak, cherry and basswood, averaging less than three logs to the thousand, and 95 per cent sixteen feet, is the best type of hardwood timber growth in the United States, and shows a larger percentage of *firsts*.

If you are a discriminating buyer, let's get acquainted.
